Preface

In the compilation of The Japan Year Book, 1939-40, care has been taken to preserve the features which characterized the preceding editions, while adding a new chapter on China. All the chapters have been gone over thoroughly and revised so as to bring the material up to date and to insure greater balance as between the various sections. In this attempt some sections and even chapters have had to be entirely or partially re-written.

Both in selection and classification of material the original plan used in the previous editions of the Year Book has been followed as the most convenient one to present this country as it is before the reader.

The Map of Japan issued with the Year Book has been changed into a combined Map of Japan and Manchoukuo to facilitate reference to places coming under review.

It is with pleasure that the editor acknowledges with thanks the assistance he has received from many friends, especially from officials of the Government, for material used in the compilation of this book.

Tokyo, September, 1939 *The Editor*

THE IMPERIAL COURT

At the heart of the Japanese nation and at the head of the Japanese State is the Emperor,[1] known to the people as the Tenshi, the Son of Heaven, or Tenno, Heavenly King. Though the ancient title Mikado persists in foreign countries, it has lost currency in Japan itself except in poetry or on very formal occasions.

The Imperial Dynasty of Japan is the oldest reigning family in the world, Japanese history dating its earthly origin from 660 B. C. The present Emperor is the 124th of the line.

H.I.M. THE EMPEROR

His Imperial Majesty HIROHITO, Emperor of Japan, 1st son of the late Emperor Taisho, was born in the Aoyama Palace, Tokyo, on April 29, 1901, and shortly afterwards was entrusted for bringing up to the family of Count Kawamura (Sumiyoshi),[2] a retired Admiral. Upon the Count's death in 1903, the Imperial Prince entered the Imperial Palace, with Marquis Kido (Takamasa) and later Mr. Kinsaku Maruo, chamberlain at the Aoyama Palace, in charge of his affairs. At the age of 7, he entered the elementary department of the Peers' School. In 1912, the year of his father's accession to the Throne, he was appointed Second Lieutenant in the Army and Sublieutenant, 2nd Class in the Navy and decorated with the Grand Cordon of the Chrysanthemum.

On completion of the elementary course in the Peers' School in 1914, he continued the study of various subjects in a special school instituted for the purpose under Admiral Togo. Promotion to the ranks of Lieutenant in the Army and Sublieutenant, 1st Class in the Navy came the same year; to Captain and Lieutenant in 1916, and to Major and Lieutenant-Commander in 1920. Ending his special studies in 1921, His Majesty toured Europe, the first Crown Prince to do so.

Because of the Emperor Taisho's illness, he was appointed Regent on November 25, 1921. Two years later, his ranks in the defence services were raised to those of Lieutenant-Colonel and Commander. Marriage to Princess Nagako took place on January 26, 1924. In 1925, he was promoted to the ranks of Colonel in the Army and Captain in the Navy. On the demise of the Emperor Taisho, December 25, 1926, he succeeded to the Throne, and the new era was named Showa, meaning Light and Peace. Formal enthronement took place in Kyoto on November 10, 1928; and the grand ceremony of making offerings to the Imperial Ancestors was held on November 14 and 15.

H.I.M. THE EMPRESS

Her Imperial Majesty NAGAKO, Empress of Japan, was born on March 6, 1903, 3rd child and 1st daughter of the late Imperial Prince[1] Kuni (Kuniyoshi), in his residence at 1, Roppongi-machi, Azabu-ku, Tokyo. She entered the elementary department of the Peers' School for Girls in April, 1909, and advanced to the higher course in March, 1915. Shortly after becoming Crown Princess-elect on January 17, 1918, she left the Peers' School for Girls and engaged in special study at home. Imperial sanction was given for marriage to the Crown Prince in June of the same year, and their betrothal took place on September 28, 1922. At that time she was decorated with the 1st Order of Merit. She was proclaimed Crown Princess on the day of the marriage,

1 For the powers of the Emperor, see Chapter IV, and Articles I—XVII of the Constitution (Appendix).

2 The personal names of members of the Imperial Family and Peers are parenthesized.

1 Prince (Shinno or O) means Prince of the Blood except when the name is followed by the word Peer in brackets, thus [Peer]. For the difference between Shinno and O see the Imperial House Law, Chapter VII, Art. XXXI (Appendix).

Digitized by Google

January 26, 1924, and Empress on December 25, 1926.

H.I.M. THE EMPRESS DOWAGER

Her Imperial Majesty SADAKO, the Empress Dowager, was born on June 25, 1884, 4th daughter of the late Prince Kujo (Michitaka) [Peer]. She entered the Peers' School for Girls in 1890 and advanced to the higher course six years later, leaving in 1899. Her marriage to Crown Prince Yoshihito, later the Emperor Taisho, took place on May 10, 1900. She was proclaimed Crown Princess on that day; Empress on July 30, 1912, and Empress Dowager on December 25, 1926. Her Majesty now resides in the Omiya Palace, Akasaka-ku, Tokyo.

H.I.H. THE CROWN PRINCE

H. I. H. Prince TSUGU (Akihito) was born on December 23, 1933, and is Heir-Apparent.

OTHER CHILDREN OF THE EMPEROR

H. I. H. Princess TERU (Shigéko) was born on December 6, 1925, and entered the elementary department of the Peers' School for Girls in 1932, and advanced to the middle school course in 1936.

H. I. H. Princess TAKA (Kazuko) was born on September 30, 1929, and entered the elementary department of the Peers' School for Girls in 1936.

H. I. H. Princess YORI (Atsuko) was born on March 7, 1931, and entered the elementary department of the Peers' School for Girls in 1937.

H. I. H. Prince YOSHI (Masahito) was born on November 28, 1935.

H. I. H. Princess SUGA (Takako) was born on March 2, 1939.

BROTHERS OF THE EMPEROR

H. I. H. Prince CHICHIBU (Yasuhito), Colonel in the Infantry, was born on June, 25, 1902, 2nd son of the late Emperor Taisho. The name Atsu was given to him at first. In 1909, he entered the Peers' School and on completion of the second year of the middle course in 1917 was enrolled in the Central Military Preparatory School. This course he finished in 1920, when he joined the 3rd Infantry Regiment, Azabu-ku, Tokyo, as a first private. Later in the same year, he entered the Military Academy, completing the regular course in 1922.

On attaining his majority in 1922, he took the name Chichibu and by Imperial order founded a new house. He was decorated with the Supreme Order of the Chrysanthemum in the same year and promoted to the rank of Second Lieutenant, attached to the 3rd Infantry Regiment. After becoming Lieutenant in May, 1925, he went abroad, studying at Oxford University until the illness of the Emperor Taisho compelled his return to Japan in January, 1927. While in England, he was decorated by the late King George V with the Grand Cross of the Royal Victorian Order.

Marriage to Miss Sétsuko Matsudaira, born on September 9, 1909, niece of Viscount Morio Matsudaira and 1st daughter of Mr. Tsunéo Matsudaira (at present Minister of the Imperial Household), took place on September 28, 1928. The Imperial Prince was promoted to the rank of Captain in 1930 and to that of Major in 1935. After a course in the Military Staff College and a term as Company Commander in the 3rd Infantry Regiment, he was attached to the General Staff, then removed to Hirosaki as Battalion Commander in the 31st Infantry Regiment on August 1, 1935. The Prince and Princess left Yokohama on March 18, for London where they represented the Throne at the Coronation of King George VI of Great Britain, which was held on May 12, 1937, and returned to Tokyo on October 15 by way of Canada. He was promoted to the rank of Colonel on August 1, 1939. His residence is at Omotécho, Akasaka-ku, Tokyo.

H. I. H. Prince TAKAMATSU (Nobuhito), Lieutenant-Commander in the Navy, 3rd son of the late Emperor Taisho, was born on January 3, 1905. At first he was named Teru. He entered the Peers' School in 1911 and left in 1920 to enroll in the Naval College. On graduation four years later, he was granted the name of Takamatsu and founded a new house to revive that of the late Imperial Prince Arisugawa, which had become extinct.

In 1925, on appointment as Sublieutenant, 2nd Class in the Navy, he was ordered to take up duties aboard the battleship Fuso. At the same time, he was decorated with the Supreme Order of the Chrysanthemum. Promotion to the rank of Sublieutenant, 1st Class came in 1927.

On February 4, 1930, he married Miss Kikuko Tokugawa, 2nd daughter of the late Prince Tokugawa (Yoshihisa)[Peer], who was born on December 26, 1911. The mother of the Princess was the 1st daughter of the late Imperial Prince Arisugawa, whose house Imperial Prince Takamatsu revived. In April of the same year, the Imperial Prince and his consort started on a tour of the world, partly to return the courtesies shown

Digitized by Google

by the late King George V of England in sending a mission to Japan to present the Order of the Garter to the Emperor. They returned to Japan in June, 1931, and took up residence in a new house at Takanawa, Shiba-ku, Tokyo. The Imperial Prince, now a Lieutenant-Commander, is attached to the office of the Naval General Staff.

H. I. H. Prince MIKASA (Takahito), Lieutenant in the Cavalry, 4th son of the late Emperor Taisho, was born on December 2, 1915, and was named Sumi. He entered the Peers' School in 1922 and left it in 1932 to enter the Military Academy. On graduation from the Academy in June, 1936, he was attached to the 15th Cavalry Regiment. On attaining his majority in 1935, he was granted the name of Mikasa and founded a new house. The residence is the Aoyama Higashi Palace located in the grounds of the Aoyama Palace.

OTHER PRINCES

KAN-IN. The present and 6th head of the House is H. I. H. Prince Kan-in (Kotohito), Field Marshal, who was born on November 10, 1865, the 16th son of the late Imperial Prince Fushimi (Kuniié), and adopted in 1867 by the Emperor Komei, the immediate predecessor of the Emperor Meiji. Ordered to France in 1882 for military studies, he remained there until 1891. After participation in the wars with China and Russia, his rise in the Army was rapid, and in 1912 he was appointed General and member of the High Military Council. In 1916, he was ordered to Russia for returning courtesies to the Russian Grand Duke's visit. The Imperial Prince became a Field Marshal in 1919, accompanied the Crown Prince to Europe in 1921 and headed the commission in charge of the Enthronement in 1928. In December, 1931, he was appointed Chief of the General Staff.

His consort, H. I. H. Princess Kan-in (Chiéko), whom he married in 1891, was born on June 20, 1872, 2nd daughter of the late Prince Sanjo (Sanétomi) [Peer].

The heir is H. I. H. Prince Kan-in (Haruhito), Major in the Cavalry, the 2nd son, who was born on August 3, 1902. He was graduated from the Odawara Middle School in 1921, appointed Lieutenant in 1927, promoted to the rank of Captain in 1932 and in the same year, following a course in the Military Staff College, appointed a member of the Directors of the Research Section of the Cavalry School. On July 14, 1928, he married Princess Ichijo (Naoko), 4th daughter of the late Prince Ichijo (Sanétéru) [Peer], who was born on November 7, 1908.

The House of Kan-in was founded in 1718 by Prince Naohito, a son of the Emperor Higashiyama. The residence is at Nagata-cho, Kojimachi-ku, Tokyo.

HIGASHI-FUSHIMI. H. I. H. Princess Higashi-Fushimi (Kanéko), consort of the late Imperial Prince Higashi-Fushimi (Yorihito), was born on August 29, 1876, 1st daughter of the late Prince Iwakura (Tomosada) [Peer]. The residence is at Tokiwamatsu-cho, Shibuya-ku, Tokyo.

FUSHIMI. The 23rd head of the House is H. I. H. Prince Fushimi (Hiroyasu), Admiral of the Fleet, who was born on October 16, 1875, 1st son of the late Imperial Prince Fushimi (Sadanaru). Ordered to Germany in 1889, he studied there for five years. He was appointed Admiral in 1922, a member of the High Military Council in 1925, Chief of the Naval General Staff in February, 1932, and Admiral of the Fleet in April of the same year.

His consort, H. I. H. Princess Fushimi (Tsunéko), was born on September 23, 1882, 9th daughter of the late Prince Tokugawa (Yoshinobu) [Peer]. She died on August 18, 1939.

The 1st son and heir, H. I. H. Prince Fushimi (Hiroyoshi), Captain in the Navy, died on October 18, 1938. His consort Tokiko, 3rd daughter of the late Prince Ichijo (Sanétéru) [Peer], was born on June 20, 1902. Their 1st son H. I. H. Prince Fushimi (Hiroaki), was born on January 26, 1932. Their first daughter, H. I. H. Princess Fushimi (Mitsuko), was born on July 28, 1929. The third daughter, H. I. H. Princess Fushimi (Ayako) was born on February 11, 1934.

The House of Fushimi was founded by a great-grandchild of the Emperor Gofushimi. The residence is at Kioi-cho, Kojimachi-ku, Tokyo.

YAMASHINA. The 3rd head of the House, H. I. H. Prince Yamashina (Takéhiko), Lieutenant-Commander in the Navy (1st reserve service), was born on February 13, 1898, 1st son of the late Prince Yamashina (Kikumaro). He was appointed Sublieutenant, 2nd Class in the Navy in August, 1919, and on July 19, 1922, married Princess Kaya (Sakiko), who died in the great earthquake the following year. His residence is at Fujimi-cho, Kojimachi-ku, Tokyo.

The House of Yamashina was founded in 1864 by the late Prince Yamashina (Akira), 1st son of H. I. H. Prince Fushimi (Kuniié), who had earlier entered the priesthood and taken the name Kanshuji.

Palaces, Gardens, etc.

Imperial Palace The residence of the Emperor covers an area of about 531 acres in Kojimachi-ku, Tokyo. Originally built in 1457 by a provincial general, Dokan Ota, who named it Yédo Castle, it became the headquarters of the Tokugawa Shogunate in the 16th century and was greatly extended. With the transfer of the capital from Kyoto to Tokyo in 1869, the second year of the Meiji Restoration, it was selected as the Imperial Residence and renamed Tokyo Castle. Much of it was destroyed in the great fire of 1873. The present palace, built between 1880 and 1888, cost ¥3,968,000. On completion, the name was changed to Kyujo, or Imperial Palace.

Other Palaces (1) Kyoto Palace. Situated in Kamikyo-ku, Kyoto it was the Imperial Residence for 1,075 years, from 794 A. D., when the capital was moved from Nara to Kyoto, until 1869, when the seat of government was transferred to Tokyo. In accordance with the Accession Law, the ceremony of ascension to the Throne is always held here. The grounds cover about 229 acres.

(2) Aoyama Palace. Situated in Akasaka-ku, Tokyo, the palace was formerly the residence of the Lord of Tamba, but in 1873 the late Empress Dowager Eisho made it her home. Within its grounds is the residence of the Imperial Prince Mikasa.

(3) Omiya Palace. Also within the grounds of the Aoyama Palace, it is the residence of the Empress Dowager, mother of the reigning Emperor.

(4) Shinjuku Imperial Garden. At Naito-Shinjuku-machi, Yotsuya-ku, Tokyo, the garden was originally the site of the residence of the Lord of the Takato, Shinano, but in 1879 it came under the control of the Imperial Household Department and in 1906 was given its present name. Here are held the spring and autumn Imperial garden parties.

(5) Akasaka Detached Palace. On part of the former property of the Lord of Kii, in Akasaka-ku, Tokyo, it was made a detached palace in 1872 and became a temporary residence of the Imperial Family from 1873 to 1889 during the construction of the present Imperial palace. Royal and princely visitors from abroad are guests here while in Tokyo.

(6) Hama Detached Palace. Situated in Tsukiji, Kyobashi-ku, Tokyo, its grounds were used by the Shoguns in feudal times for falconry and are now the scene of Imperial duck-hunting parties.

(7) Kasumigaséki Detached Palace. Formerly the residence of the late Imperial Prince Arisugawa, it is located behind the Foreign Office in Kojimachi-ku, Tokyo.

(8) Nijo Detached Palace. Originally Nijo Castle, in Nakagyo-ku, Kyoto, it was made a detached palace in 1884.

(9) Katsura Detached Palace. Located at Katsura, Ukyo-ku, Kyoto, it was formerly the residence of Prince Katsura [Katsura-no-miya] and became a detached palace in 1883.

(10) Shugakuin Detached Palace. Widely known for its beautiful garden, it was built by the Tokugawa Shogunate in the reign of the Emperor Gomizunoo at what is now Shugakuin, Sakyo-ku, Kyoto, and was made a detached palace in 1883.

(11) Hakoné Detached Palace. On Lake Ashi in the Hakoné region, it was seriously damaged in the 1923 earthquake and has been left unrepaired.

(12) Muko Detached Palace. At Suma, Kobé, it became a detached palace in 1908.

(13) Hayama Imperial Villa. Because of its proximity to Tokyo, at Hayama-machi, Kanagawa prefecture, it is a favourite retreat, especially in the winter. Here the Emperor Taisho died in 1926.

(14) Taté-ishi Rest-House. It is located at Nishiura-mura, Miuragun, Kanagawa prefecture.

(15) Numazu Imperial Villa. The palace is at Agehara-machi, Numazu, on Suruga Bay, Shizuoka prefecture.

(16) Nikko Imperial Villa. Nikko-machi, Tochigi prefecture, is the location.

(17) Tamozawa Imperial Villa. This also is at Nikko-machi, Tochigi prefecture.

(18) Shiobara Imperial Villa. The palace is at Shiobara-machi, Tochigi prefecture, a district noted for its maples.

(19) Ikao Imperial Estate. This estate or preserve is at Ikao-machi, a mountain resort in Gumma prefecture.

(20) Nasu Imperial Villa. Mountain views are the main attraction of Nasumura, Nasu-gun, Tochigi prefecture, where the palace is situated.

(21) Nagara River Preserve. This preserve for ayu lies in Gujo-gun, Mugi-gun and Inaba-gun, Gifu prefecture.

(22) Yédo River Preserve. There are two parts, one in Higashi-Katsushika-gun, Chiba prefecture, and the other in Minami-Saitama-gun and Kita-Katsushika-gun, Saitama prefecture. The preserve abounds in water-hens, herons, snipes, quails, white swans, wild geese,

Digitized by Google

ducks, plovers, pheasants, water-rails, etc.

(23) Jintsu River Preserve. This preserve for trout, salmon and other fish is located in Nei-gun and Kami-Niikawa-gun, Toyama prefecture.

In 1930, the Nagoya Detached Palace was donated to Nagoya city; and the Odawara Imperial Villa and Shizuoka Imperial Villa were abolished, part of the latter being granted to Shizuoka city. In 1931, the Atami Imperial Villa and Kamakura Imperial Villa were abolished and the former was sold to the city of Atami.

Miyanoshita Imperial Villa was abolished, December, 1933, and given to H. I. H. Imperial Prince Takamatsu.

Imperial Household Finance

The Civil List is appropriated by the National Treasury and no approval of the Diet is necessary except when an increase in it is required. At present, it amounts to ¥4,500,000. The Board of Imperial Auditors is located in the Imperial Household Department and its present Director-General is Mr. Michio Kinoshita. Prince Saionji, Baron Ikki and Count Makino are financial advisers to the Imperial Household.

The total Imperial Household expenditure is estimated at approximately ¥20,000,000 annually and is met by the Civil List, and by receipts from the Imperial forests, Imperial estates and other Imperial property.

The Naidaijin-fu

The Naidaijin, Grand Keeper of the Imperial Seals, who has been so called from olden times, is a dignitary of the Imperial Household with the function of keeping the Imperial and State Seals and of administering matters regarding Imperial decrees and documents of the Imperial Household. He is a State functionary of the Shinnin rank, or one appointed directly by the Emperor, and is assisted by three secretaries in the execution of his duty.

Present Grand Keeper of the Imperial Seals is Mr. Kurahéi Yuasa.

The Imperial Household Department

The Imperial Household Department is divided into eleven principal subsidiary offices, namely, the Secretariat of the Minister, the Board of Chamberlains, the Board of Ceremonies, the Imperial Family and Peerage Board, the Imperial Mausolea Bureau, the Imperial Archives Bureau, the Court Physicians Bureau, the Bureau of the Imperial Table, the Imperial Treasury Bureau, the Maintenance and Works Bureau, and the Imperial Stables Bureau, and is charged with the conduct of affairs pertaining to the Imperial Household. There are, in addition to those above mentioned, such other institutions as follows coming under the supervision of the Minister of the Imperial Household:

The Office of H. I. M. the Empress' Household,
The Office of H. I. M. the Empress Dowager's Household,
The Board of the Imperial Auditors,
The Imperial Forests and Estates Board,
The Imperial Poetry Bureau,
The Imperial Museums (at Tokyo and Nara),
The Peers' School,
The Peers' School for Girls,
The Temporary Board for the Compilation of the History of the Emperor Meiji.
The Kyoto Office of the Imperial Household.

Since 1884, it has been placed outside the pale of the administrative system, so that the Minister is in no way affected by any Cabinet change.

The present and preceding Ministers of the Imperial Household Department are:

Name	Time of Appointment
Late Prince Hirobumi Ito	Dec., 1885
Late Marquis Hisamoto Hijikata	Sept., 1887
Viscount Mitsuaki Tanaka	Feb., 1898
Late Prince Tomosada Iwakura	June, 1909
Viscount Chiaki Watanabé	April, 1910
Baron Takatada Hatano	April, 1914
Late Baron Yujiro Nakamura	June, 1920
Count Nobuaki Makino	Feb., 1921
Baron Kitokuro Ikki	Mar., 1925
Kurahéi Yuasa	Mar., 1933
Tsunéo Matsudaira	Mar., 1936

The Peerage

The modern system of the Peerage, with its five grades of Prince, Marquis, Count, Viscount and Baron, dates from 1884, but prior to this there was a well-established aristocracy. Up to the time of the Meiji Restoration, there were two groups, the Court Nobles, called Kugé, most of whom were descendants of younger sons of Emperors, and the Feudal Lords, called Daimyo or Tonosama, most of whom had attained their standing through military prowess. With the Restoration, these were amalgamated

Digitized by Google

under the name of Kwazoku (Peerage), meaning the "Flowers of the Nation". In 1884, an Imperial edict was issued establishing the five grades of the present Peerage, and to the members of the Kwazoku were added subjects who had assisted in the work of the Restoration. In the first list there were 11 Princes, 24 Marquises, 76 Counts, 376 Viscounts and 382 Barons.

When Chosen was annexed in 1910, 67 Koreans of distinction were selected to become Peers, 6 Marquises, 3 Counts, 22 Viscounts and 45 Barons.

The families of the Peerage stood as follows on June 30, 1938:

Grade	Number of Families.	Korean Peers
Prince	19	—
Marquis	41	7
Count	109	3
Viscount	376	17
Baron	408	32
Total	953	59

Decorations

To recognize and reward persons who render distinguished and meritorious service to the State, orders of merit and decorations were created in 1875 and supplemented in later years. The orders of merit, of which there are nine—the Grand Order and numerical orders from 1st to 8th—are only nominal and serve to indicate the class of decoration to which a holder is entitled. The decorations themselves are of 9 kinds:

Supreme Order of the Chrysanthemum There are two kinds, the Collar of the Supreme Order of the Chrysanthemum and the Grand Cordon of the Supreme Order of the Chrysanthemum, both reserved for those given the Grand Order of Merit. The first, the highest Japanese decoration, is a gold chain or collar from which is hung a small badge representing a chrysanthemum, to which is fastened a large sunburst flanked with chrysanthemum flowers and leaves. The second is marked by the same badges, but worn at the left hip at the bottom of a cordon or ribbon of red with purple edges hung from the right shoulder.

Rising Sun and Paulownia This is a single decoration, combining the devices of two lesser orders, known as the Grand Cordon of the Imperial Order of the Rising Sun with Paulownia Flowers which is awarded only to holders of the 1st Class Order of Merit. From a cordon of red with two white stripes, worn over the right shoulder and resting on the left hip, are suspended a small badge showing paulownia flowers and leaves and a larger badge, below it, of a double-rayed rising sun flanked with paulownia flowers.

Rising Sun There are six classes, from the Grand Cordon of the Rising Sun, to which holders of the 1st Class Order of Merit are eligible, to the 6th Class Order of the Rising Sun, which holders of the 6th Class Order of Merit may receive.

Paulownia Two classes exist, sometimes referred to as the 7th and 8th classes of the Order of the Rising Sun. The Order of the Blue Paulownia is for holders of the 7th Order of Merit, and the Order of the White Paulownia for holders of the 8th Class Order of Merit.

Sacred Treasure Known as the Imperial Order of the Sacred Treasure. Of this order there are eight classes. The badge represents the Mirror and Gem of the Imperial Regalia, and the cordon is of light blue with two orange stripes.

Precious Crown Its full name is the Imperial Order of the Precious Crown. The eight classes of this order are bestowed on women only, who were barred from receiving any other decoration until 1919, when they were also made eligible for the Order of the Sacred Treasure. The badge shows the Precious Crown, with cherry blossoms and bamboo, and the cordon is of yellow with two scarlet stripes.

Golden Kite Purely a military order, known as the Imperial Military Order of the Golden Kite, this has seven classes. The cordon is green with two white stripes. It carries a life annuity, fixed in 1916 at ¥1,500 for the 1st Class; ¥1,000, 2nd Class; ¥700, 3rd Class; ¥500, 4th Class; ¥350, 5th Class; ¥250, 6th Class, and ¥150, 7th Class. This is granted to the family for one year following the recipient's death, and, if he has died within five years of being decorated, until the end of that period.

Holders of any decorations who are sentenced to death, penal servitude or imprisonment for more than three years are deprived of decorations, accompanying diplomas and, if any, annuities. They may also be ordered to surrender them if guilty of acts of dishonour, depending on the circumstances.

Cultural Decoration Creation of the cultural order to be awarded to those who have made outstanding contributions to science, arts, literature or other fields of culture was announced on February 11, 1937. There are no grades

Digitized by Google

or classes in the decoration. The devise consists of three replicas of the Sacred Jewels, symbolizing philanthropy and virtue, placed in the centre of a white tachibana blossom, (a kind of mandarin orange, Citrus tachibana Tanaka), and the decoration is suspended from a light purple ribbon worn around the collar.

Medals of Honour The Medal with Red Riband is conferred on persons who risk their lives in rescuing others; the Medal with Green Riband on those who distinguish themselves for filial piety, feminine virtues, devotion to the aged and loyalty to masters; the Medal with Blue Riband on those who aid public and private undertakings by important discoveries or inventions; the Medal with Dark Navy Blue Riband on those who contribute money or property for public welfare; and the Medal with Yellow Riband, divided into two classes, gold and silver, on persons who help undertakings connected with coast defence. Cups of gold or wood or monetary gifts are sometimes granted simultaneously to the recipients.

Court Rank

Court rank is specially conferred on persons who distinguish themselves in service to the State, peers and their heirs, officials and army and navy officers. There are 16 grades, from the senior grade of the first rank to the junior grade of the eighth rank, and all affairs pertaining to them are administered by the Imperial Family and Peerage Board in the Imperial Household Department in accordance with the Court Rank Act, promulgated in 1926.

There were 282,257 holders of Court rank at the end of 1937, divided as follows:

	Senior	Junior
First	—	—
Second	28	76
Third	492	880
Fourth	2,032	5,127
Fifth	10,105	13,754
Sixth	16,740	21,191
Seventh	40,490	71,577
Eighth	97,688	2,077

Stick Granted to the Aged

In the 12th century, Toshinari Fujiwara, a Court noble, was granted on the celebration of his 90th birthday a stick for use at Court by the Emperor Gotoba. This honour, known as Kyuchuzué or Hatozué because the stick has a pigeon top, is today bestowed on Court dignitaries and officials and officers of high rank who have attained the age of 80 in recognition of signal service to the Court and the State, though it is marked by a monetary gift in lieu of an actual stick. Living holders follow:

Prince Saionji (Kimmochi)
Count Kiyoura (Kéigo)
Baron Kuratomi (Yuzaburo)
Viscount Kanéko (Kentaro)
Viscount Ishiguro (Tadanori)
Baron Yamamoto (Tatsuo)
Mr. Ikunosuké Fujisawa
Baron Kojiro Uchiyama
General Goro Shiba

Court Artists

For the promotion and encouragement of fine arts, representative artists are chosen by a special committee in the Court and their appointment as Court artists is made by the Minister of the Imperial Household. The artists may produce objects of art for the Court or present opinions upon Imperial enquiries on questions pertaining to arts. The present Court artists are as follows:

Sculptor	Choun Yamazaki
Painters	Séiho Takéuchi
	Gyokudo Kawai
	Taikan Yokoyama
	Yukihiko Yasuda
	Kansétsu Hashimoto
	Kéigétsu Kikuchi
	Éisaku Wada
	Saburosuké Okada
	Takéji Fujishima
Metal Carver	Kamézo Shimizu
Metal Worker	Shushin Katori
Ceramist	Hazan Itaya

State Funerals

There had been no special provision for the State Funeral for honoured personages, although it had been held several times since the 16th year of Meiji, or 1883. The Government, however, issued the State Funeral Ordinance as an Imperial Order in 1926. According to the Ordinance, the State Funeral is held with distinguished rituals, its expenses being borne by the National Treasury. There are two kinds of State Funeral, i.e. the one for Imperial Personages and the other for the subjects. The former is still divided into two; the first one is called the Grand Funeral and is for the Emperor, the Empress Dowager, the Empress Dowager and the Empress, while the second one is called the Imperial Funeral and is

Digitized by Google

for the Crown Prince, the Crown Princess, the Emperor's grandson and his consort, the Regent Imperial Prince or Emperor's daughters or children. Both the Grand and Imperial Funerals are held under special ritual according to the Provisions of the Imperial House Funeral Ordinance.

The State Funeral for the subjects is held in honour of those who contributed distinguished services to the country by the special order of the Emperor and the ritual and order of the Funeral is fixed by the Premier with the Imperial sanction.

State Funerals have been accorded to the following since the beginning of the Meiji Era :

Okubo (Toshimichi)	1869
Prince Iwakura (Tomomi) [Peer]	1883
Prince Shimazu (Hisamitsu) [Peer]	1887
Prince Sanjo (Sanétomi) [Peer]	1891
Prince Arisugawa (Taruhito)	1895
Prince Kitashirakawa (Yoshihisa)	1895
Prince Mori (Motonori) [Peer]	1896
Prince Shimazu (Tadayoshi) [Peer]	1897
Prince Komatsu (Akihiko)	1903
Prince Ito (Hirobumi) [Peer]	1909
Prince Arisugawa (Takéhito)	1913
Prince Oyama (Iwao) [Peer]	1916
Grand Prince Ri (Kei)	1919
Prince Yamagata (Aritomo) [Peer]	1922
Prince Fushimi (Sadanaru)	1923
Marquis Matsukata (Masayoshi)	1924
Prince Ri (Séki)	1926
Marquis Togo (Héihachiro)	1934

Imperial Interest in Social Work

On various occasions of great importance in the Imperial Household, grants of money are made from the Privy Purse for social welfare, instances of which follow :

Year	Occasion	Purpose or Recipient	Amount in Yen
1897	Empress Dowager Eisho's Funeral	—Charity	400,000
1912	Emperor Meiji's Funeral	—Charity	1,000,000
1914	Empress Dowager Shoken's Funeral	—Charity	600,000
1915	Emperor Taisho's Enthronement	—Charity	1,000,000
1924	Prince Regent's Wedding	—Promotion of social works	1,000,000
	,,	—Encouragement for the poor to send children to school	1,000,000
1925	Emperor Taisho's Silver Wedding	—Young Men's and Women's Ass'ns	750,000
	,,	—Cultural bodies in the Colonies	250,000
1927	Emperor Taisho's Funeral	—Charity	1,500,000
1928	Demise of Princess Hisa, the Emperor's daughter	—Protection of the young	50,000
1929	Emperor's Enthronement	—Charity	1,500,000
1934	Birth of the Crown Prince, Akihito	—Protection of mothers and the young	750,000

Since 1879, it has been the custom of the Imperial House to make monetary contributions when there are floods, fires, railway accidents, violent winds, shipwrecks, earthquakes, famines, volcanic eruptions, mine explosions, etc. Immediately after the great earthquake and fire of 1923, a grant of ¥10,000,000 was made for relief.

A fund of ¥1,500,000 in 1911 for extension of medical treatment to the poor was used to found the Saiséi-kai, the Imperial Charity Association, which continues active today. Additional money for this work was included in the grant of ¥3,000,000 in 1932 for relief of the poor, and it was extended to the Colonies by a grant of ¥300,000 to the Overseas Ministry.

With the ¥1,000,000 granted on the occasion of the wedding of the present Emperor, Viscount Kiyoura, Premier at the time, established the Kéifuku-kai, Beatitude Association, for promotion of social work done by private bodies. On every Kigénsétsu, the anniversary of the foundation of the country, which takes place on February 11, Imperial grants are made directly to public and private social welfare organizations. At first limited to such organizations as the Japan Red Cross Society, the Women's Patriotic Association, the Imperial Association for the Support of Soldiers, the Salvation Army, the Fukuden-kai (Charity Association) Orphanage and the Tokyo Asylum, these grants have been greatly increased since 1921 and now go even to superior private bodies in Chosen, Taiwan, Karafuto, the Kwantung Leased Territory and the South Sea Islands. In 1939, the number of the recipients of the Imperial donation reached 807 organizations, the money amounting to about ¥200,000.

In 1932, a grant of ¥1,500,000 was made

Digitized by Google

to the Association for the Promotion of Learning through the Education Minister.

Since the days of the Emperor Meiji, it has been customary for the Emperor, while travelling in the provinces to supervise the grand military and naval manoeuvres or on observation tours, to send representatives to various welfare organizations to present money or other gifts.

Also since the beginning of the Meiji Era, the Emperor, the Empress, the Empress Dowager and the Imperial Princes and Princesses have frequently visited charity hospitals, schools for the blind and dumb and other social welfare institutions. Many such organizations have Princes and Princesses of the Blood as presidents. The present Empress Dowager is particularly interested in the relief of lepers and in 1930 granted funds to all bodies engaged in this work.

In April, 1939, H. I. M. the Empress granted funds to the sum of ¥500,000 for the prevention of tuberculosis and the treatment of the patients.

Court Rituals

GRAND RITUALS. The Grand Rituals are those conducted by the Emperor personally, with Princes and Princesses of the Blood, Court dignitaries and officials and officers of high rank in attendance. Brief descriptions follow :

Genshisai, the celebration of the auspicious origin of the Imperial Throne at the beginning of the year, is performed on January 3 by the Emperor at the Three Shrines in the grounds of the Imperial Palace, the Kashikodokoro, where the Sacred Mirror is installed, the Koréiden, the shrine of the Imperial Ancestors, and the Shinden, the sanctuary of Shinto deities.

Kigénsétsusai, to celebrate the ascension to the Throne of the Emperor Jimmu, is performed by the Emperor at the Three Shrines on February 11. In the evening sacred music and dances are given in a pavilion in front of the Koréiden.

Shunki-Koréisai, for the worship of preceding Emperors and Empresses and Princes and Princesses of Imperial lineage, takes place in the Koréiden on the day of the vernal equinox.

Shunki-Shindensai, performed on the same day in the Shinden, is to offer thanks to the Gods of Heaven and Earth for their blessings and to petition for their continuance.

Jimmu-Tennosai, which takes place in the Koreiden, marks the anniversary of the demise of the founder of the country, the Emperor Jimmu, on April 3. To his mausoleum is dispatched on the same day a Court official representing the Emperor to make offerings. At fixed intervals, the Emperor personally conducts the rite at the mausoleum.

Shûki-Koréisai and Shûki-Shindensai are identical in form and purpose with the vernal equinox rituals but take place on the day of the autumn equinox.

Kannamé-no-Matsuri, the ritual of offering thanks for the harvest and new rice to the soul of the Imperial Ancestress, Amaterasu-Omikami, which takes place in the Grand Shrines of Isé on October 16 and 17, is duplicated in the Kashiko-dokoro at the Imperial Palace on October 17.

Niinamé-no-Matsuri, conducted between November 23 and 24, is marked by the Emperor partaking of new rice after offering it to the Imperial Ancestress, Amaterasu-Omikami, and all the Gods of Heaven and Earth. The same ritual, when performed at the Emperor's enthronement, is called Daijo-sai.

Taisho-Tennosai marks the anniversary of the demise of the Emperor Taisho, the Emperor's father, and is celebrated in the Koreiden on December 25. In the evening, sacred music and dances are performed in a pavilion in front of the shrine. A court official representing the Emperor is sent on the same day to the mausoleum of the Emperor Taisho to make offerings, a rite which the Emperor himself performs at fixed intervals.

ORDINARY RITUALS. These are Court rituals which the Emperor does not conduct personally, but which he attends with the Princes and Princesses of the Blood, Court dignitaries and officials and officers of high rank.

Saitansai, held at dawn on January 1 at the Three Shrines, is for worship of the Imperial Ancestors and the Gods, offering thanks to them for the grace of Heaven and supplicating for its continuance.

Koméi-Tennosai marks the anniversary of the demise of the Emperor Komei, great-grandfather of the Emperor, and is held in the Koreiden on January 30. The rite of presenting offerings at his mausoleum is performed on the same day.

Kinensai, held on February 17 in the Three Shrines is the ritual of praying for a bountiful harvest and for the continued prosperity and well-being of the Imperial House and the nation. A Court official representing the Emperor is dispatched on the same day to the Grand Shrines of Isé to make offerings,

Digitized by Google

and offerings are also presented at various other shrines.

Ninko-Tennosai, marking the anniversary of the demise of the Emperor Ninko, great-great-grandfather of the Emperor, is performed on February 21 in the Koreiden. Offerings are made and a ritual conducted at his mausoleum on the same day.

Tenchōsétsusai, held in the Three Shrines on April 29, the birthday of the Emperor, is the ritual of praying for the longevity of His Majesty.

Meiji-Tennosai is observed in the Koreiden on July 30 to mark the anniversary of the demise of the Emperor Meiji, grandfather of the Emperor. Offerings are made and a ritual performed at his mausoleum on the same day.

Meijisétsusai is held on November 3 to praise the great achievements of the Emperor Meiji, to remember his high virtues, to invigorate and develop the spirit of the national revival in the Meiji Era and to pray for increased national prosperity.

Kashikodokoro-Mikagura, a sacred dance, is held in the Kashikodokoro in the middle of December. As no definite date is fixed, an auspicious day is named every year by Imperial order.

OTHER RITUALS. The Imperial Court also observes several rituals not specified in the Court Ritual Act :

Shunsai, Tenth-day Ceremony, is held on the 1st, 11th and 21st of every month except January 1, the Emperor observes the ceremony for the Gods more elaborately than on the usual days.

Futsukasai and Mikkasai are performed on January 2 and 3, with the New Year's Day Ceremony. These are observed with specially elaborate rituals.

Joyasai, New Year's Eve Ceremony. At the end of the year the Emperor gives thanks to the Gods for their benevolence throughout the year and prays for blessings in the coming year.

Yo-ori, the rite for purification of the person of the Emperor, is held in the Phoenix Hall of the Imperial Palace on June 30 and December 31.

O-harai, held on the same days as Yo-ori, is a similar rite for the purification of all officials and officers from sins committed unconsciously.

SPECIAL CEREMONIES. Two special ceremonies at the Imperial Court are worthy of note :

Kosho-Hajimé, or the ceremony of delivering lectures in the Court at the beginning of the New Year, takes place in the presence of the Emperor and Empress, Princes and Princesses of the Blood and Court dignitaries in the Phoenix Hall. Usually three lecturers are chosen, with three others held in reserve, from the nation's most erudite scholars of Japanese classics, Chinese classics and Western learning to lecture on subjects related to their specialties.

Utakai-Hajimé, or the Imperial New Year Poetry Party, is usually held in the middle of January in the presence of the Emperor and Empress, Princes and Princesses of the Blood and high Court dignitaries. Though long in existence, it became one of the most important annual ceremonies in 1869. A few months in advance, the Imperial Household Minister announces the theme for the waka, or tanka, poems of 31 syllables, to be submitted. For the honour of having a poem read in the ceremony, anyone may compete. In addition to those by subjects, poems by the Emperor and Empress and other members of the Imperial Family are read.

CHAPTER I

GEOGRAPHY

Position and Extent

The Japanese Empire, wholly within the Asiatic half of the North Pacific, consists of Japan proper and various colonies. At the time of the Meiji Restoration, 1868, there were the four large continental islands of Honshu, or Hondo, usually known as the Mainland, Kyushu, Shikoku and Hokkaido, or Yezo, and 4,068 adjacent islands of smaller size. Russia ceded the long chain of islands called the Chishima, or the Kuriles, in 1875. The Ogasawara-jima, or Bonin Islands, were formally annexed in 1877, and the Ryukyu, or Loochoo Islands, in 1879, though both groups had been earlier under Japanese control. All these areas today constitute Japan proper.

The Colonies The first colony, Taiwan, or Formosa, with the adjacent islands called the Bokoto, or Pescadores, was ceded by China in 1895 following the Sino-Japanese War. The Russo-Japanese War brought Karafuto, or the southern half of the island of Saghalien, and, in Manchuria, the Kwantung Leased Territory and the South Manchuria Railway Zone. Chosen or Korea, was annexed in 1910. The mandated Caroline, Mariana and Marshall Islands, former German possessions in the South Seas, were received by Japan at the Versailles Peace Conference, 1919. With the exception of the Aleutians, the northern half of Saghalien, the Philippines, North Borneo, Hawaii and a few small scattered islands, including Guam, the Empire spreads over all the islands in the Pacific north of the equator.

The most northern part of the Empire, the island of Araito in the Chishima, touches 50° 55′ N. Lat. The southern extreme is in the mandated Caroline Islands, 1° 01′ N. Lat. To the west, the Bokoto extend to 119° 18′ E. Long., and to the east, the mandated Marshall Islands reach 172° 10′ E. Long.

Length and Width If the South Sea Islands, the Kwantung Leased Territory the South Manchuria Railway Zone and the continental peninsula of Chosen are omitted, the Empire is a semi-circle of islands extending in latitude from 21° 45′ N. to 50° 55′ N., approximately 3,380 kilometres, and in longitude from 119° 18′ E. to 156° 30′ E., with a maximum width of about 320 kilometres.

Area

The Home Ministry's revised investigation puts the total area of the Empire at the end of 1936, at 681,323.30 square kilometres, distributed as shown in the following table :

	Area in sq. km.
Grand Total	**681,323.30**
Japan proper	382,545.42
Honshu	230,532.32
Shikoku	18,772.83
Kyushu	42,078.99
Hokkaido	88,775.04
Ryukyu	2,386.24
Chosen	220,794.34
Taiwan	35,834.35
Bokoto	126.86
Karafuto	36,090.30
Kwantung Leased Territory	3,462.45
South Sea Mandated Islands	2,148.80
S. M. R. Zone	320.78

Of 675,391.27 square kilometres, exclusive of the three territories last named, Japan proper occupies 56.6 per cent of the total area, while Chosen occupies 32.6 per cent, Taiwan 5.3 per cent, and Karafuto 5.3 per cent each.

The area of each prefecture in Japan proper arranged in the order of size follows :

AREA OF PREFECTURES
(In sq. km.)

			%
1.	Hokkaido	88,775.04	23.2
2.	Iwaté	15,235.31	4.0

	Total	382,545.42	100.0

Geological Formation

The Japanese islands lie at the east end of the Eurasia Continent, spreading more than 3,800 kilometres on the Pacific. They are arranged in the form of a festoon or a breakwater for the Continent against the Pacific waves. The numerous islands may be divided into four groups or bows: the Nippon Bow, the Chishima Bow, the Ryukyu Bow and the Ogasawara or Bonin Bow. The Nippon Bow is composed of the Main Island and the small islands around it. The Main Island itself draws an arc, its convex surface projecting into the Pacific and its concave surface facing the Japan Sea, because the whole Nippon Bow was pushed out to the ocean by a mountain-making process from the side of the Japan Sea. The Nippon Bow again is composed of two mountain systems, with the Fuji volcanic range as the dividing line: they are the Northern range, or the Karafuto mountain system, and the Southern range, or the Kwenlun mountain system.

Recent excavations seem to show that it almost impossible to find the oldest rocks in the formation of the Japanese Islands, but it was formerly assumed that gneiss and crystalline schist, which belong to the oldest geological eras, were found in Japan.

Gneiss Distribution Gneiss is distributed mostly in the Nippon Bow and Chosen and cannot be found in the Ryukyu and the Chishima Bows. It runs through the centre of the southern half of the Nippon Bow, while in the northern half it may be found in the plateau of Abukuma. In Chosen it is spread over a wide area. Crystalline schist runs generally along the outside of the gneiss system. In the southern part of the Nippon Bow, it starts at the Akaishi range and runs through the Kii range to Shikoku, where it develops in a wide area, taking the place of gneiss; then it crosses the strait to Kyushu and sinks under the Aso volcanic chain to appear again at Nagasaki. In Taiwan it forms the eastern part of the Taiwan mountain range. In the northern half of the Nippon Bow, it appears in the Kanto range and may be found in the Ezo mountain system of Hokkaido and in Karafuto.

Palæozoic Layer The Japanese palæozoic layer is largely aqueous rock, composed mainly of slate, sandstone, silica stone, limestone, grit stone and graywacke, with a compound of such igneous stones as granite and diorite. It is widely distributed and has much to do with the geological formation of Japan. But at the Palæozoic Era the Japanese land lay deep in the waters and did not treasure up coal as did the Palæozoic layer of the Continent. The oldest stratum of the Main Island which has been proved with a fossil is the Carboniferous layer, and any decision on older layers must remain uncertain until similar proof is available. The Palæozoic layer forms the bones of the big mountain ranges developing at the circumference of the Archæan stratum of the southern part of the Nippon Bow and is distributed in the Akaishi, Kii, Shikoku and Kyushu mountain ranges. Traces are also visible in the Hida range, Hida plateau, Tamba plateau, Chugoku range and Tsukushi range. In the northern half, it runs through the Kanto, Ashio, Hachimizo, Abukuma and Kitakami ranges to the Ezo range and Karafuto. It can also be seen in Taiwan and Chosen in wide areas.

Mesozoic Stratum The Mesozoic stratum of Japan is composed of stones similar to those of the earlier stratum. Fossils are sufficiently numerous to assure the era in which it was formed. It appears in the Kii range, the southern

Digitized by Google

part of Shikoku, the Kyushu range and the Taiwan range. In Chosen, it is found in the Keisho district. In the Chugoku district, the western part of the Main Island, it comes to the surface, leading to the belief that the plains of this district were formed in this era.

Neozoic Stratum The Neozoic stratum is composed mainly of aqueous rock and volcanic stones. In this era, the transformation of land and sea was incessant, and volcanic activities were most vigorous, creating most of the present volcanic chains. Through the tertiary and quaternary periods, andesite and basalt were emitted in great volume. Most of the coalfields, oil-fields and metal mines of Japan were formed in the tertiary period. In the diluvial day of the quaternary period, volcanic explosions followed one after another, and the hills by the rivers and the higher plains of the Kanto took their present form. In the alluvial, or the most recent day of the same era, the lowest and the newest stratum at rivers, lakes and the sea shore, or sand-banks and sand hills, came into existnce. According to the investigation of the Geological Research Office, the areas of rocks of different geological eras in Japan proper are as follows :

	Sq. km.	%
Archæan stratum	14,189	3.50
Palæozoic ,,	53,149	12.74
Mesozoic ,,	29,844	7.15
Neozoic ,,	196,079	49.87

Block Movements According to this investigation, two-thirds of the land is of the Neozoic stratum, showing that Japan must have been upheaved upon the surface of the sea in the most recent geological era, and the large volume of vomitted rocks speaks of violent volcanic activities.

In the Palæozoic Era, the islands were all hidden under shallow waters. Even the Hida and Akaishi mountain peaks, which form the ridge of the Mainland, are composed of the sediment on the sea-bottom in those days. At the end of this era, the highest mountain ranges began to expose their heads above the waters. It was a golden age for the Mollusca and fishes, the Amphibia coming to existence at the end of it. In the vegetable kingdom, Cryptogams grew in great forests which disappeared with the end of the era.

At the Jurassic period of the Mesozoic Era, China and most of Chosen appeared upon the surface of the sea, but the land of Japan was still covered with waters, except for the great mountain ranges, which began to show their complete figures. It was the age in which the cycad, the gingko and the Coniferæ grew in abundance and toward the end of which the latifoliate trees came into existence. In the animal kingdom, the reptiles made great progress, and queer gigantic animals lived everywhere in the sea, in the air and on the land.

When the Neozoic Era dawned, Japan became a stage of great block movements of earth, and it was severed from the continent, taking the form of a chain of countless islands. The present location was assumed, although the northern part was a little later than the southern half. The line which connects the islands runs from south to north because the pressure of the block movement was from west to east. As the movements gradually ceased and the dividing lines of land and sea became stationary, the present animals and vegetables began to grow, and finally primitive men appeared.

Relationship with Continent The close connection of the islands with the Continent is supported by considerable evidence. It is asserted by most scholars that they are continental islands, which are usually located near a continent, from which they were severed in the latest geological era. It is clear that the mountain ranges of Japan have a close connection with the Kwenlun mountain system. The north range of the Chinese mountains, after sinking into the sea, appears again in the northern part of Kyushu and reaches the central part of the Main Island, running through the Chugoku district, and the eastern end of the China mountain system reappears in southern Kyushu, from where it reaches to the Akaishi range through Shikoku Island and Kii province. It is also known that the sea between the Japanese Islands and the Continent is but 200 metres deep at the maximum from Taiwan to Chosen. That is, if the waters fell by this distance, the East China Sea, the Yellow Sea and the Gulf of Chihli would be dried up, and Kyushu, Shikoku, the Mainland, Hokkaido and Karafuto would be connected by land. In a sharp comparison, the sea to the east and south of the islands suddenly becomes as deep as 4,000 metres and even more in some places. These facts prove that the Japanese Islands were once a part of the Continent of Asia.

Digitized by Google

Japanese animals belong to those species which are included in the old northern division in the animal distribution of the world, and Japanese plants have very close relations with those on the Continent of Asia and are quite different from those of the American Continent. Finally, paleontology gives us proof in fossil teeth of the elephant. In the layers which belong to the tertiary period or the diluvial day of the quaternary period, these fossils are often found, and some are of the same kind as those excavated in the southern districts of China. We may thus conclude that the Islands of Japan were connected with the Continent of Asia in a prehistoric but comparatively new geological era.

Natural Features

The mountains of Japan are divided into two great systems, one to the north and the other to the south. The Karafuto system, framing Northern Japan, is composed of the Yezo, Kitakami, Abukuma, Kanto and Echigo ranges, arranged from north to south, roughly speaking. Southern Japan is framed by two branches of the Kwenlun system, which has its origin in China. One branch first appears in the northern part of Kyushu as the Tsukushi range and then runs to the east, forming the Chugoku range, the Tamba plateau, the Hida plateau and the Kiso range. The other branch appears in the southern part of Kyushu, forming the Kyushu range, from which it runs east, becoming the Shikoku, Kii, Suzuka and Akaishi ranges.

Japanese mountains have characteristic fine creases, cut by the rainfall, which is specially heavy in this country. The Kyushu, Shikoku and Akaishi ranges were formed by the creasing process; such mountains as Fuji, Nasu, Chokai and Kirishima resulted from volcanic activities, and the Kongo, Kasagi, Suzuka and Mahiru mountain ranges were born in dislocative earthquakes. As for age, the mountains of the Chugoku and Abukuma ranges, with their dull curves, are the oldest; the Shikoku range, the Japan Alps and the Ohu range, or the range in the northeastern Mainland, are rugged and young, and the plains of the Kanto district and Gifu and Aichi prefectures are very young. The combination of these mountains and plains of diverse ages is peculiar to Japan.

Volcanic chains According to the Geological Research Office, the total number of volcanoes in Japan is 192, of which 58 are active. They may be grouped in 11 chains:

(1) The north Japan inner, or Chokai, volcanic chain, which starts at the southwestern offing of Hokkaido, or O-shima and Ko-jima, and runs through Iwaki-yama, Kampuzan, Moriyoshi-yama Chokai-san, ending with Gatsusan.

(2) The south Japan inner, or Hakusan, volcanic chain, extending from Hakusan along the Japan Sea to the west through Daisen, Mitsubé-yama, Aono-yama and other smaller volcanoes and then to the Goto Islands of Kyushu.

(3) The Hokkaido volcanic chain, which links such mountains as Hakodaté-yama, Komaga-daké, Tarumayé-daké and some islands in the peninsular part of western Hokkaido.

(4) The north Japan central, or Nasu, volcanic chain, including Osoré-yama, Hakkoda-san, Towada Lake, Iwaté-yama, Komaga-daké, Kurigoma, Numasawa, Arao, Funagata, Za-oh, Bantai, Azuma, Adatara, Nasu, Nantai, Shirané, Akagi, Haruna, Tsuno-otoshi and Arafuna, which are mostly active volcanoes.

(5) The Hida volcanic chain, composed of the seven volcanoes of Heradaké, Taté-yama, Ko-tombi, Washibadaké, Iwo-daké, Norikura-daké and On-také.

(6) The Mikasa volcanic chain, to the west of the Hida volcanic chain, beginning with Horaiji-san, of Aichi prefecture, and running westward to O-hara-yama, Mikasa-yama, Miminari-yama, Futakami-san and Kabuto-yama of Hyogo prefecture.

(7) The Seto, or Inland Sea, volcanic chain, embracing the old volcanic mountains along the coasts of the Inland Sea and extending to Kyushu, including such mountains as Futako, Kokonoyé, Yufu, Onsen and Tara. The volcanoes are all dormant.

(8) The Ryukyu volcanic chain, starting with the Aso volcano, taking in Kirishima, Sakurajima and Kaimon and extending to the Ryukyu Islands, where it connects Iwojima, Kuchino-Irabé-jima, Kuchinosé, Nakano-jima, Suwanosé, Waruiwa-jima, Tori-shima and Aguni-shima.

(9) The amphibolite andesite volcanic chain, which connects Aono-yama of Shimané prefecture and Tokusa of Yamaguchi, appears then in Kinpo-zan and Shiguma-daké near Tokuyama, and Himé-jima of Suo; meets with the Inland Sea chain and runs to Yufu, Kokonoé and a part of Aso, and extends as far as Luzon Island, sinking to the bottom of the ocean west of the Ryukyu Islands on the way and then running along the eastern coast of Taiwan.

Digitized by Google

(10) The Fuji volcanic chain, which cuts across the heart of the Main Island from the coast of the Japan Sea to that of the Pacific Ocean, and continues to the Izu, Bonin, Sulphur, Mariana and Caroline Islands, including such mountains as Myoko, Togakushi-yama, Tateshina-yama, Yatsuga-daké, Fuji-san, Hakoné and Amagi on the Main Island.

(11) The Chishima volcanic chain, which comes into Hokkaido from the Chishima, runs along the Ézo mountain system, suddenly turns to the north and seems to disappear in Karafuto.

The Japanese volcanic mountains are composed of four kinds of rocks : pyroxene andesite, amphibolite andesite, bronzite andesite and basalt. Fuji, Iwaki, Chokai, Gatsu-san, Nasu, Hakkoda, Iwaté, Bantai, Akagi and Haruna are of pyroxene andesite. In southern Japan, the Kirishima volcanic range is composed of the same rock, which is, indeed, the most widely distributed in the Japanese volcanoes. Amphibolite andesite is discovered in the mountains which belong to the inner volcanic chains—Hakusan, Dai-sen and Mitsubé-yama. It shows itself in Taté-yama, Norikura and Ontaké also, but is most evident in the Kyushu volcanoes. Bronzite andesite is limited to the district of Kinki, near Osaka, and the volcanic mountains and islands in and along the Inland Sea. Basalt is distributed in Chugoku and the northern Kyushu districts, exposing itself at the Basalt Cave of Toyooka, Hyogo prefecture, Ōné-shima, Hamada, Hagi, the Aburatani Gulf and Fukué of the Goto Islands.

Seas and Coast-line

With the exception of the northern frontiers of Chosen and Karafuto, every part of the Empire is surrounded by water. To the east is the Pacific, washing the Chishima, Hokkaido, Honshu, Shikoku, Kyushu, the Ryukyu, Taiwan and the mandated islands north of the equator. Between the Chishima and Karafuto is the Sea of Okhotsk, and between Karafuto and the continent the Gulf of Tartary, known to the Japanese as the Mamiya Straits. The Sea of Japan lies between Honshu and the eastern shore of Chosen. To the west of Chosen is the Yellow Sea, or Hwanghai, opening into the Eastern China Sea, or Tunghai, which touches Kyushu, the Ryukyu and Taiwan. Purely Japanese is the famous Inland Sea, enclosed by Honshu, Shikoku and Kyushu.

The Depths The greatest depth yet discovered in these surrounding seas is 9,439 metres, sounded by the warship Manshu in 1926 between Honshu and Ogasawara Is. 30° 49′ N. Lat. and 142° 18′ E. Long. Previously the record was the 8,517 metres of the Tuscarora Deep, named for the American warship which made a survey in 1874, sometimes called the Kurile-Japanese Trench, which lies along the Chishima for about 644 kilometres. The other seas are shallower than the Pacific. The Sea of Okhotsk, which is estimated to have an area of 1,527,007.73 square kilometres, has a mean depth of 838 metres. The Sea of Japan, estimated to extend over 1,007,307.41 square kilometres, has a maximum depth of 3,440 metres and a mean depth of 1,350 metres. The Eastern China Sea, except near the Ryukyu and Taiwan, is less deep. With a length of about 354 kilometres and a maximum width of 77 kilometres, the Inland Sea covers 3,430.43 square kilometres and reaches its greatest depth at 124 metres.

The Currents Two ocean currents with important climatic effects are the Kuroshio, meaning black current, which sailors know as the Japan stream, and the Oyashio, meaning main current, which foreigners often call the Kurile stream. The first is warm and the second cold. Arising from the North Equatorial Current north of the Philippines, the Kuroshio flows along the eastern side of Taiwan and the southern islands of the Ryukyu to about 26° N. Lat., where it splits, the main part moving to the eastern coasts of Kyushu, Shikoku and Honshu and then bearing eastward past the Aleutian Islands to the North American coast, and the offshoot flowing to the west of Kyushu and into the Sea of Japan. Varying in width from 160 to 805 kilometres, depending on the position and the season of the year, it is usually from 5° to 15° C. warmer than the rest of the ocean. The Oyashio originates in the Arctic, washes the eastern shores of the Chishima, Hokkaido and Honshu, meeting the Kuroshio at Kinkazan. From the Sea of Okhotsk, another cold current enters the Sea of Japan through the Gulf of Tartary and flows along the Chosen Coast.

Tides Tides in the Japanese Empire show wide variation. High on the shores of the Yellow Sea and the Eastern China Sea, they reach from 10.4 to 10.7 metres at Jinsen, or Chemulpo, Chosen, and 5.5 metres at Miiké, Omuta, on Tsukushi Bay, Kyushu, but in the Sea of Japan they average little more than 0.6 metre. Along the Sea of Okhotsk, they range from 1.2 to 1.5 metres ; along the Pacific coast, from

Digitized by Google

1.9 to 2.7 metres, and in the Inland Sea, from 1.8 to 4 metres.

Coast-line The coast-line is exceptionally long, being 52,231.787 kilometres for the whole Empire, exclusive of the Kwantung L. T. and the mandated South Sea Islands. For Japan proper, it is 30,605.458 kilometres, which means a kilometre to every 12.43 square kilometres of area, and for Chosen 18,203.726 kilometres, a kilometre to every 12.12 square kilometres. The shores of the Sea of Japan are comparatively regular, but those on the Pacific are indented with a large number of gulfs, bays and inlets, many of which afford excellent anchorages. Japan proper has more than 1,400 harbours, about half of which are utilized for trading. The best harbours of Chosen are on the Yellow Sea and the Chosen Channel. Hokkaido, Karafuto and Taiwan are less fortunate in capacious shelters for ships.

Mountains

In Japan proper, there are 250 mountains with peaks higher than 2,000 metres above sea level, the highest being the celebrated Mount Fuji, which lifts its white cap sublimely 3,773 metres above the beautiful Suruga Gulf. Chosen has 51 and Formosa 130 mountains in the same category, but the latter has five peaks higher than Mount Fuji, Niitaka-yama being the highest mountain in the Japanese Empire with its height of 3,950 metres. The highest mountains in Japan proper are converged in the central part of the Main Island in the prefectures of Nagano, Toyama, Yamanashi, Shizuoka and Gifu, but there are, of course, many other mountains famous geographically and historically in other parts of the country.

Rivers

The Empire is abundantly watered by numerous rivers, usually wide where they empty into the sea, but comparatively short in course and not navigable for many miles inland except by flat-bottomed craft. During the summer rainy season and when the mountain snows melt in the spring, torrents rush down them, often overflowing and causing damage; during the rest of the year, they dwindle to narrow and shallow streams. If of little use for transportation, they serve as reservoirs from which water is drawn for irrigation and increasingly as sources of electric power.

Total available hydro-electric power of rivers in Japan proper is estimated at 14,090,000 h.p., the power actually developed by the end of 1934 was about 4,348,862 h.p.

The major rivers, with navigable length, follow:

Honshu	Length in Km.	Navigable Length in Km.

Lakes

The Empire contains numerous lakes, especially in Honshu and Hokkaido, remarkable for their beautiful setting rather than extent. The most interesting are those high above sea level, formed in most cases by volcanic eruptions damming the head-waters of rivers.

The major lakes, with their height above sea level, area and depth follow :

	Above Sea Level (m.)	Area (Sq. km.)	Depth (m.)
Honshu			
Biwako	86.3	716.31	95.0

Flora

In summer the southern part of Japan experiences tropical weather, while in winter the districts north of the north-eastern provinces are subject to arctic cold. But owing to ample rainfall, the growth of plants in Japan is in general very rich, yet agriculture occupies so large a proportion of area as to restrict not only the natural distribution of flora and fauna, but a scientific study of the subject as well.

The flora of Japan is by most botanists divided into four zones :

(a) Tropical forest zone, or the banian (Ficus retusa) zone.

Digitized by Google

(b) Subtropical forest zone, or the kashi (Quercus acuta) zone.
(c) Temperate forest zone, or the beech-tree (Fagus Sieboldi) zone.
(d) Arctic forest zone, or the dwarf mountain fir (Pinus pumila) zone.

I **The Tropical Forest Zone.** The tropical forest zone, or the banian zone, covers those portions of the plain of Formosa lower than 450 m. above sea level, as well as the Loochoo, Bonin, Sulphur and the South Sea Islands. The aerial roots of the Ficus retusa are not so large as those of the banian in India, but the species grows in abundance and to a great height, sending down its aerial roots into the ground like the tentacles of an octopus. In some parts of Sulphur Islands, the Loochoo Islands and Formosa it forms impenetrable forests. The cocoanut tree is rare but grows well. In Formosa the pineapple thrives naturally, while the Agave American grows quite tall. The cycad (Cycas revoluta), the tree fern (Cyathea spinulosa), the coffee plant (Coffea Arabia), the gum tree, the orange tree, the sugarcane, the mangifera (Mangifera Indica) and the papaw-tree (Caria papaya) grow luxuriantly.

II **The Subtropical Forest Zone** The subtropical forest zone, or the oak zone is limited to altitudes of from 450 to 1,800 m. in Formosa, and as low as sea level in the northern half of the Loochoo Islands. The plains of Kyushu, Shikoku, that part of the Main Island south of 35 degrees North Latitude, and the southern half of the Korean peninsula belong to this zone, the temperature here being from 13° to 21°C. (55° to 70°F.), and the altitude below 1,120 m. at Mount Kirishima in Kyushu; 650 m. in the northern part of the same island: 760 m. in Shikoku, 600 m. in Chugoku or west of Kobé; 500 m. in the Tokaido districts; and 460 m. at Tsukuba-yama in the Kanto district.

Plants peculiar to this zone are those which belong to such species as the camphor-tree, the oak, the camellia, and the Ternstroemia Japonica, evergreen and latifoliate. On sandy shores, where the sea wind is strong, the black pine (Pinus thunbergii) grows, with spreading, contorted branches, an indispensable element of the Japanese landscape, made familiar to the world through the paintings of Hokusai and Hiroshigé. In the southern part of this zone the camphor-tree (Cinnamomum camphora) is abundant. The hemp-palm (Trachycarpus excelsa), the Nagi (Podocarpus nagi) the banana plant (Musa basjoo) and the cycad are planted as ornamental trees, and grow to a good size. Agricultural plants in this zone are rice, barley, soy-bean, red-bean, German millet, the field cabbage (Brassica campestris), colza, cotton (Gossypium herbaceum), indigo-plant, tea-plant, mulberry-tree, mandarin orange, as well as the sugar-cane and the potato. In this zone there is only one rice crop a year while in the first zone it is harvested twice a year.

III **The Temperate Forest Zone** The temperate forest zone, or beech-tree zone, lies north of the 2nd zone in the Main Island, the south-western part of Hokkaido, more than half of its whole area, and in the mountainous portions of Korea; it begins at 37.5 degrees north latitude at the coast and 35° in the Main Island, and ends at 43.5° in the central part of Hokkaido. The temperature of these areas is from 6° to 13° C. (42°-56° F.). In Formosa, the mountain valleys which are between 1,800 and 4,550 m. above sea level belong to this zone, and there grow the cryptomeria, the Picea jezoensis, the hemlock and the Formosan five-leaf pine (Pinus parviflora). The representative species of this zone in the Main Island is the beech, but it is almost extinct because of commercial exploitation. In Niigata prefecture grow many species of deciduous latifoliate trees, such as the oak (Quercus glandulifera), the Quercus crispula and the horse-chestnut (Aesculus turbinata), while among these, in some places are found varieties of acerose trees such as the Japanese cypress, the Chamaecyparis obfusa, the hatchet leaved arborvitae (Thujopsis dolabrata), the fir (Abies firma), the Tsuga Sieboldii, the Abies homolepis, the Korean pine (Pinus koraiensis), the Larix kaempferi, and the like. The timber line of this zone is 4,550 m. in Formosa,—Kyushu, Chugoku, Kinki or the Kyoto-Osaka districts have no mountain which rises above this line; 2,060 m. in Shikoku; 1,700–1,760 m. in Shizuoka prefecture; 1,500 m. in Nagano and Yamanashi prefectures; 1,400-1,060 m. in the northern districts of the Main Island; 450 m. in the southern part of Hokkaido, and down to sea level in the centre of Hokkaido.

The agricultural plants in this zone are barley, wheat, soy-bean, red-bean, German millet, the Panicum frumentoceum and the peanut. In the north rice is often subject to damage from early frost. The forests in the southern half of this zone are the most beautiful in Japan, especially those sections dominated by trees of Kiso valley.

Digitized by Google

namely, the Japanese cypress, the Thuja standishii, the Thujopsis dolabrata, and the Sciadopitys verticillata. The cryptomeria forms vast natural forests in Akita prefecture.

IV The Arctic Forest Zone The arctic forest zone, or the dwarf mountain fir zone, occupies the mountain elevations above 4,500 m. in Formosa, and does not exist in Kyushu, except in small patches above 900 m. on the mountains. In the central part of Japan, Fuji, Ontaké, the Nikko and many other mountains are in this zone, while in Shikoku the belt lies between 1,800 m. to 2,580 m. The Abies veitchii, the fir-tree (Abies sachaliensis), the hemlock, the Larix kaempferi, the Abies firma, the yew-tree, the Alnus firma, the Sorbaria randaiensis and the Alpine-rose (Rhododendron hyminanthes) grow in this zone, but the principal trees differ according to districts. In Formosa, the Abies sachaliensis is the principal tree, the Abies veitchii on Kiso, Fuji, the Nikko and other high mountains located within 40 degrees north latitude in the Main Island; the Abies firma and the Larix kaempferi in the districts further north, and the Abies sachaliensis again in Aomori prefecture. In Hokkaido and Karafuto the Abies sachaliensis and the spruce (Picea ajanensis) grow plentifully, but are not found in the Main Island. In addition, in Karafuto, the larch flourishes, as also does the Juniperus chinensis along the seashore.

Marine Flora According to Dr. Okamura, the marine flora of Japan in the Pacific Ocean is divided into two by Oshima Island, to the south of which, including the Bonin Islands, is the Tropical division, while from north of Oshima to Kinkazan lies the Temperate division. The ocean district north of Kinkazan belongs to the Arctic division, although at the southern end of this division can be found, to a certain extent, Temperate-zone seaweeds. On the western side of Japan, that is, along the coast of the Japan Sea, the Tropical and Temperate seaweed zones are divided at Makurasaki or Noma Peninsula at the west end of Kyushu Island, while the arctic zone begins at the Tsugaru Straits.

Korea As may be inferred from the geographical relation existing between the continent and the peninsula on the one hand and between the latter and Japan on the other, the flora of the northern part (38°-43° N.Lat.) of the peninsula bears a great resemblance to that of the eastern Asiatic continent, while the flora of the southern part has a close resemblance with that of the western part of the Main Island of Japan.

Dense forests of conifers are frequently seen in the northern districts. Pinus koraiensis is a species commonly found there. The flora of the northern half has many northern elements and bears a close relation to the flora of Manchuria and Siberia.

Elements characteristic of northern China are also to be found in the flora of the western part of Korea. Endemic genera are comparatively few,—a characteristic of continental floras. Among the endemic genera, Hanabusaya Nakai and Chosenia Nakai may be mentioned as the most interesting. Both genera are monotypic, the former belonging to the family Campanulacæ, and the latter to the family Salicaceæ.

The South Sea Islands Pemphis acidula, Scaevola frutescens and Tournefortia argentea grow on the shore. Coconut palms and screw pines grow among the littoral bushes. Allophylus timorensis and Wedelia biflora are the most common species and form a dense growth in the interior of the islands. Generally speaking, the flora of the islands is extremely poor as far as the number of species is concerned. This suggests that it is of comparatively recent origin.

Classification. There are in Japan, nearly 20,000 species of flora known to botanists. The "Illustrated Book of Botany" published by a Tokyo botanical association contains 2,070 representative species classified as follows:

	No. of Species
I Phaneregamæ	
A Angiospermæ	
(a) Dicotyledoneæ	
1 Sympetalæ	519
2 Archichlamydeæ	1,046

Fuji, Sakura, Sumiré, Sugé, Susuki, and Kiku

According to Dr. Makino species of the phanerogamae alone number from 8,000 to 10,000 in Japan proper. Among this great number of plants, there are very many which are specially Japanese and unique in the botanical world. Several of the most prominent of these plants are selected here and a brief explanation on each of them is given below:

Fuji (Kraunhia floribunda) Fuji or wistaria is a plant peculiar to Japan. Chinese wistaria differs from that of Japan, and strangely enough no Chinese wistaria is transplanted in Japan, while it is found in Europe and America. The Chinese wistaria is the so-called murasaki fuji, or purple wistaria, it therefore cannot be classed as belonging to the same species as the Japanese fuji.

The Japanese wistaria is divided into two species, viz. fuji and yama fuji (Kraunhia brachybotrya), or wild wistaria. Both grow in mountains, but are often cultivated in gardens. Yama fuji grows wild in Shikoku, Kyushu, and Chugoku and their vines are sinistal. Its flower is larger in size, but the raceme is short. Some yama fuji found in nurseries have white flowers and are called shira fuji, or white wistaria. Botanists in the West consider it an independent species, but it is only a variety of yama fuji. The ordinary fuji grows wild all over Japan and its vines are dextral. Wistaria found in Nara Park and that in Kasukabé in Saitama prefecture belong to this species. Its flower-clusters are very long and they sometimes measure as much as several feet.

Sakura Sakura, or cherry-blossom, is celebrated in Japan from olden times. Yama-zakura (zakura is the euphonic form of sakura in the compound), (Prunus serrulata var. spontanea), or wild cherry blossom, is the most important of all species of cherry blossoms. The famous poem of Norinaga Motoori,

Shikishima no
Yamato gokoro-wo hito towa ba
Asahi ni niwo yamazakura bana.
(Isles of blest Japan!
Should your Yamato Spirit
Strangers seek to scan,
Say—the cherry wild and fair
Lightened up in morn's sun-lit air!)

refers to this yamazakura. This species grows in the districts stretching from Kyushu in the south to Kinki (near Kyoto) in the Main Island. Many places which are noted for this sakura are found in the belt lying between these two districts. The most famous of them is Yoshino Yama near Nara.

Recently some scientists made an attempt to call it shiro yamazakura, or white wild cherry, because they gave the name of beni yamazakura, or red wild cherry to the other species. But to this red wild cherry the name of ōyamazakura (Prunus serrulata var. sachalinensis) has already been given.

Ōyamazakura grows in the mountain districts of the Central provinces, Tohoku, Hokkaido and Karafuto and was not probably known to our ancestors in the western half of the Main Island who loved yamazakura.

The ordinary yamazakura grow in mountains and are planted in public and private gardens or along public roads.

The so-called satozakura, or village cherry, does not grow in the mountains. They must have varied from the original yamazakura.

The sakura which is called Yoshinozakura by florists and is widespread to-day all over the country with Tokyo as the centre, is known as somei-yoshino (Prunus yedoensis), in the botanical world. It appeared in Tokyo at the beginning of the Meiji Era. But where florists at Somei got its seedlings is not known. It was about the fifth year of Meiji that they were planted in Ueno Park. The reason that this blossom is called somei-yoshino by scientists is to avoid confusion with the sakura at Yoshino mentioned above. Somei-yoshino appears not to have existed in Yedo, the present Tokyo, during the time of the Tokugawa Shogunate.

This somei-yoshino, strange as it is, existed exclusively in Tokyo, and was

Digitized by Google

rarely transplanted out of the city for long. It is found everywhere in Japan to-day, but it is only since 1902 that it began to spread out from Tokyo.

It has become known that this species of sakura is growing wild in Saishu Island, Korea. However, since it cannot be surmised that its seedlings were brought to Tokyo from this island, the true origin of this sakura in Japan proper is still unknown. Some Western botanists consider somei-yoshino as a species akin to higan-zakura (Prunus subhirtella), which blossoms at the time of the equinoctial week, and oshima-zakura (Prunus serrulata var. albida, a kind of yamazakura which grows on Oshima Island, Tokyo prefecture). But it is not confirmed yet.

Higan-zakura belongs to a different species. It is divided into two classes in botany. The trunk of one class is large, while that of the other is small. The former is found in Ueno Park, Tokyo, and the latter is rarely seen in the Kanto district.

The small higan-zakura, however, is found everywhere in Kansai (western) district and blossoms much prettier than the other variety. It is also found in Nagano prefecture, although it grows into a comparatively large-sized tree.

The large higan-zakura is not found in such great numbers as the other. Jindai-zakura of Nagano, and Ishiwari-zakura of Iwaté belong to this species. Shidaré-zakura (the willowy sakura) also comes from this species and is called azuma-higan.

Sumiré (Viola mandsurica) The species of sumiré or violets is called viola in botany and violet is the popular English name, while sumiré is the popular Japanese name for it. This name is said to have originated in the carpenter's "sumitsubo or sumiiré", or Indian inkstand made of wood resembling the flower in shape. According to this theory "sumiiré" gradually changed into "sumiré," the name by which the flower is known today.

In botany, sumiré is restricted to a species with flowers of deep purple-colour. Varieties are ko-sumiré, tsubo-sumiré (Viola verecunda), tachitsubo-sumiré (Viola grypoceras) akané-sumiré (Viola phalacrocarpa), ezo-sumiré, ki-sumiré, tsukushi-sumiré (Viola diffusa), etc.

Japan is a kingdom of violets where more than a hundred species are found. No other country in the world compares with Japan in this respect.

Sugé(Carex) Of sugé, carex or sedges, the most prominent is kasa sugé (Carex disparata), or umbrella sedges, and mino sugé, or raincoat sedges. More than 300 species of carex are found in Japan.

Susuki (Miscanthus sinensis) Susuki, or pampass grass is called in some places kaya. The tassel-like bunches of its flowers are called "obana," which is included among Nanakusa, or seven herbs. (See Chap. XXXVII, Calendar of Annual Events).

The graceful form of susuki with obana on them touches the Oriental heart and has been the subject of many celebrated poems. There are many species such as masuhono-susuki, masuuno-susuki, sugurono-susuki, etc.

Susuki grows abundantly on mountains and in fields, and the tuffs of obana nod before the wind, giving a characteristic Japanese touch to the autumnal landscape.

Kiku (Chrysanthemum sinense) Kiku or chrysanthemum is a celebrated flower in Japan. It is worthy of being the national flower and is used as the Imperial crest.

The Chinese chrysanthemum, from which the Japanese kiku is derived, had been cultivated in China before it was transplanted to Japan.

The scientific name of this flower is Chrysanthemum sinense. The name chrysanthemum is that given to the genus of this family in Europe apart from kiku, before this flower was known in that continent. Sinense is the name of the species and means China. Therefore Chrysanthemum sinense means the Chinese chrysanthemum. Chrysanthemum japonicum, therefore, is the scientific name of the Japanese chrysanthemum or ryuno-giku. Chrysanthemum arcticum, or arctic chrysanthemum, is the scientific name for kohamagiku.

The origin of the chrysanthemum is the wild chrysanthemum grown in China. The Chinese began to cultivate it. The chrysanthemums which were cultivated by Chinese horticulturists were brought into Japan and grew into countless varieties of the chrysanthemum of to-day. In 1884 it was found by Dr. T. Makino, that the original Chrysanthemum sinense, which were thought to have existed only in the old China, grows in Loochoo Islands, Kyushu, Shikoku and the part of the Main Island west of Kobé.

He gave it the name of nojigiku (Chrysanthemum sinense var. japonense).

The stems, leaves, flowers, colour and fragrance which nojigiku possesses are the same as those which the original species of cultivated chrysanthemum in China has.

Fauna

Japan possesses an exceedingly rich and varied fauna closely related to the adjacent continent and classified into two principal groups, the Palæarctic, and the Oriental. Of these the Palæarctic elements are chiefly found in the northern territories, such as the Kuriles, Saghalien, Hokkaido, Japan proper, and Korea, while the Oriental ones range over the islands of Formosa and Loochoo.

Because birds and animals can move their habitat it is more difficult to classify them but, in general, Formosa, the Loochoo, and the Bonin Islands belong to the so-called Oriental zone, according to the world biological division, and include such tropical animals as the buffalo (Bubalus bubalis), the Formosan leopard (Felis dardi brachyurus), the Manis pentadactyla and the big snakes. Tropical insects are found in abundance. In the Loochoos live such rare species as the Trimeresurus flavoviridis, a poisonous snake, and the leaf-butterfly (Kallima inachus formosana). South of Bird Island, Izu, albatross frequent the blue waters; while in the Bonin Islands and southward the Japanese white-eye congregate. On Sulpur Island tropical birds with red tails can often be seen. From Kyushu northward according to the biological theory, extends the Palæarctic zone with its fauna of the Temperate zone, specially domestic animals; while the wild animals found are the antelope (Capricornis crispus), deer (Sika nippon), wild boar (Sus leucomystax), bear (Ursus torquatus japonicus), fox (Vulpes vulpes japonicus), badger (Nycterentes procyonoides), the Meles anakuma, the Martes melampus, and the squirrel (Sciurus lis). Different species of monkeys are also found. Among birds there are the green pheasant (Phasianus versicolor versicolor), copper pheasant (Graphophasianus soemmerringii scintillans), snowy heron (Egretta garzetta garzetta), hawk (Astus gentilis schvedowi, etc.); the crow (Corvus coronoides japonensis) is the most common. In the northeastern districts of the Main Island, and in the high mountains, are found all the birds of the north, and also such arctic rovers as the hare (Lepus brachyurus brachyurus) and the ptarmigan (Lagopus mutus japonicus) both of which become white in winter. In Korea, the hedgehog (Erinaceus koreanus), tiger (Felis tigris coreensis), Korean pheasant (Phasianus colchicus karpowi), crane (Megalonis japonensis) and the like are seen.

As there is a wide difference between the kinds of animals in the Main Island and Korea, so also is there quite a difference between those of the Main Island and Hokkaido. In Hokkaido the monkey is no longer seen; the Hokkaido bear (Ursus arctos yesoensis) takes the place of the bear (Ursus torquatus japonicus); while the species of deer, rat, squirrel and ptarmigan are unlike those of the Main Island.

Karafuto again differs from Hokkaido in its species of animals. The rat, squirrel and the Ursus arctos yesoensis are the same, but there are also such species as musk-deer (Moschus moschiferus parvipes) and wild cat (Lynx lynx borealis), while in winter the tiger comes across the frozen sea from the nearby continent.

Coming to the urodele, there are various species of it, the majority of them being considered as peculiar and finding their homes in the southern district. Such species are represented by Hynobius nebulosus, H. stejnegeri, H. vandenburgi, etc. One of the most noteworthy is the giant salamander (Megalobatrachus japonicus), which inhabits the cool mountain streams of provinces in Honshu, south of Gifu, and also in Kyushu. Although not common, it is not very rare. It is known to occur also in China, and may be said to represent a good example which marks off the East Asian subregion from the others. As the representative of the northern district may be recorded Hynobius peropus, which is found at high altitudes. Extensively distributed in Japan proper are Diemictylus pyrrhogaster and Onychodactylus japonicus, the former being the commonest of all.

The freshwater fishes are known from an immense number of species, many of which appear to be rather limited in distribution. Some are confined to particular river valleys, others inhabit the lakes of a limited district only, while some are restricted to a comparatively narrow area. Generally speaking, the southern district presents us with the following species: Acheilognathus limbatus, Sarcocheilichthys variegatus, Opsariichthys uncirostris, Zacco temminckii, Brittosus kawamebari, Sicyopterus japonicus, Rhinogobius hadropterus, etc. Ranging over the northern area are found such forms as Oncorhynchus, Pseudoperilampus typus, Chloea senbae, etc. Widely spread over Japan proper occurs ayu or Plecoglossus altivelis. The river Nagara, in Gifu prefecture, is famous for its fishing with the cormorant.

Marine Fauna

On the Pacific side Japan has two principal streams of different temperatures. The warm current is known as the Japan stream, or Kuroshio, which is peculiar for its high salinity. This stream has its origin in the north Pacific current from the east, and passes into the East China Sea, moving northwards by way of Luzon and Formosa.

The cold current is the well-known Kamchatka stream, or Oyashio, which rises from the Behring Sea, and passes down south along the eastern coast of the Kurile group and Hokkaido, extending farther southwards off Kinkazan, or beyond, where it meets the aforesaid Kuroshio.

Receiving a paramount influence of the currents just sketched out, Japanese waters command a very rich and varied marine fauna, there being found two types of animal life, the northern and the southern. Neglecting here some southern and northern elements, which have their limits north in the Behring Sea and south off the Loochoo group, respectively, the following three faunal areas may be more or less clearly recognized, though contiguous zones blend one into the other :

(1) Northern zone, extending from the shore of the Kurile group to that of the northern part of Honshu which lies to the north of Kinkazan.

(2) Middle zone, extending from off Kinkazan to near the Shionomisaki, on the Pacific side, and representing the zone of mingling of the arctic or subarctic and tropical or subtropical forms. The Japan Sea may be dealt with as corresponding as a whole to this zone.

(3) Southern zone, comprising the shores of the parts of Japan proper lying to the south of the Shionomisaki, the Loochoo group, the Bonin group, and Formosa.

Northern Zone This district is frankly subarctic, containing animals characteristic of the Behring Sea on the one hand, and of the Okhotsk Sea on the other. Amongst the carnivorous mammals the sea otter (Enhydra lutris) is circumpolar in range, being confined to the north of Hokkaido, while the Steller sea lion (Eumetopias jubata) and several seals (Phoca vitulina, Ph. fasciata, etc.) frequent the more southern waters, some of them occasionally appearing in the seas off Hokkaido and Amurland. The northern fur seal (Callorhynus ursinus) which is of economic importance particularly abounds in Kaihyo-to (Seal I.), a small island near Saghalien and also on some islands of the Kuriles.

Turning to cetacea, there are three whalebone whales, such as Balaena glacialis, B. mysticutus, and Rhachianectes glaucus.

Around the Kuriles, Hokkaido, and Saghalien are found in immense quantities many fishes like the cod, salmon, and herring, which are of the same great economic importance as in Norway, Scotland, Newfoundland, and other countries.

In comparatively shallower waters are found some ascidians, like Halocynthia roretzi, Chelyosoma siboja, Molgula crystallina, M. redikorzevi, etc. The first two are largely eaten in this country. Much less developed here than in the tropics are a number of echinoderms.

Ranging from the Behring Sea to the Japan Sea occurs Paralithodes camtschatica, which attains a large size and is one of great economic importance. Its famous fishing grounds are the coasts of Kunashir and Saghalien. With this is associated the most edible crab, Chionecetes opilio.

A large number of molluscs are known from this district, of which the most valuable species are Ostrea gigas, Mactra sachalinensis, Pecten yesoensis, Ommastrephes sloani pacificus, etc.

Amongst medusae, such forms as Haliclystus spp., Aurelia limbata, Cyanea spp., Chrysaora spp., Staurophora discoidea, and Sarsia spp. frequent the northern waters.

Middle Zone In this district the arctic or subarctic overlaps the tropical or subtropical fauna, there being distinguished a great variety of animals. Most of the types characteristically Japanese belong here, abounding in rock pools and about the rocky islands. Setting aside some mammals, northern and southern, some whalebone whales may be recorded here, which are of great economic importance. The blue whale (Balaenoptera Sieboldi) which is of wide distribution and of migratory habits, appears off Kinkazan and Hokkaido in summer, and about Shikoku and Kyushu in winter. Swimming in schools in the seas around Japan proper and Hokkaido is found the common finwhale (Bal. physalus) which appears in the north in summer, and in the south in winter. The Sei whale (Bal. borealis) has a range almost similar to the preceding, extending from the southern Kuriles in the north to as far south as the Goto group. Their famous hunting grounds are off the southern Kuriles.

Digitized by Google

Némuro in Hokkaido, Kinkazan, the Shionomisaki, the Goto group, and Korea.

Here intruded from the southern seas are found a few species of reptiles, like Disteria cyanocincta, Hydrus platulus, Caretta olivacea, and Eretmochelys squamosa which sometimes extend north up to Hokkaido.

The chief species of fishes, the occurrence of which marks this zone off from the others, may be said to be Cynias manazo, Hyporhamphus sajori, Apogon semilineatus, Halichoeres poecilopterus, etc. Some valuable fishes, as the Japanese porgy, bonitos and tunnies are caught here in immense quantities. Of scombroid fishes, Scomber japonicus and Thunnus orientalis are found on both sides, the Pacific and the Japan Sea, extending from Saghalien and Hokkaido in the north to the East China Sea in the south. Besides, this district abounds in sardine (Sardinea melanosticta), which is replaced in the north by the herring and in the south by Etrumeus micropus. Engraulis japonicus also occurs in great abundance, having a range somewhat wider than the sardine. Here it may be noticed that, assuming the Boso peninsula near Tokyo to be a boundary, the species of the northern area gradually drop off, and the species of the southern area become more and more conspicuous. The reverse is true of the southern elements.

Amongst ascidians there are some species like Halocynthia karasboya, Microcosmus hartmeyeri, Styela kroboja, etc.

Echinoderms are plentiful, being comprised of a number of interesting species of Ophiostiba hidekii, Asteroschema japonicum, brittle-stars, sea-urchins, and sea-cucumbers.

Amongst crustaceans, one of the most notable is a giant crab, Macrocheira kaempferi, which appears to be confined to this zone, on the Pacific side. Neptunus trituberculatus is also endemic and ranges all around Japan proper. Having a range nearly similar to the giant crab is an edible spiny lobster, Palinurus japonicus. Besides, there is a good catch of penaeid prawns which are decidedly stragglers from the southern zone.

In the Japan Sea the water is by no means simple or isolated, but compound and connected with those of other seas. Of fishes the bonitos and Euthynnus are scarcely found in the Sea. Some crabs, like Chionecetes opilio, etc., are of great commercial value and huge quantities are caught. Besides, some shrimps and prawns, belonging to the genera Pandalus and Crangon, are also found in much abundance. Amongst the cephalopods, one of the most notable is an oegopsid, Watasenia scintillans, which emits luminescence. It appears abundantly in Toyama Bay, about May. Ommastrephes sloani pacificus is thickly and extensively distributed in the Sea, its thickest distribution roughly coinciding with the extension of the Tsushima stream.

Southern Zone The fauna about Kyushu and Shikoku is less characteristically Japanese, having much in common with the neighbouring shores of the islands of Bonin, Loochoo, and Formosa, where there are forms which are almost or quite identical with those met with about the South Sea islands of Java, Celebes, Borneo, etc.

Exclusive of the hair seal (Zalophus lobatus), occasionally appearing in this zone, there can be seen a few species of whalebone whales and toothed whales.

Extensively spread over this zone are some species of reptiles, such as Laticauda laticaudata, L. colubrina, Emydocephalus ijimae, Disteira melanocephala, etc., most of them being found not to range over to the middle zone.

Of fishes there is a number of forms which are of great economic importance. Of scombroid fishes, such forms as Rastrelliger chrysozonus, Grammatorcynus bilineatus, and Gymnosarda nuda which inhabit the tropical seas have their range to Loochoo; Acanthocybium solandri and Euthynnus yaito are spread, on the Pacific side, into the middle zone; and Katsuwonus pelamis is of very wide distribution, ranging from Formosa to Hokkaido, on the Pacific side, and to middle Honshu, on the Japan Sea side, though very few in number. Cybium chinense and Sarda orientalis are rather abundant about Kyushu, but they are found in northern Honshu, both off the Pacific and the Japan Sea coasts. Of other important fishes, Pagrosomus major, Evynnis cardinalis and Talus tumifrons are distributed from Formosa to middle Honshu. Besides, some forms like Embolichthys mitsukurii, Halichoeres opercularis, Chaetodon setifer, Ch. vagabundus, and others are found to extend to, or about southern Kyushu; Kuhlia marginata ranges from the southern seas to Idzu, and Safole toeniura to Misaki.

As they proceed southwards, ascidians seek a lower level of the sea for their habitat. Echinoderms are very much in

Digitized by Google

evidence, presenting a number of species which inhabit the southern tropical seas. Some crabs like Scylla serrata, Neptunus pelagicus and Trapezia extend their range northwards to about Loochoo and Kyushu.

Ranging from off the Goto group to the Kumano Sea is a famous coral-bed, where we have such forms as Corallium japonicum, C. elatius, C. konojoi, and C. inutile. The first two corals are also found forming a bed in the waters near the Bonin group, as well as north to Formosa.

The sponges are very rich and varied. The sponge of some commercial value is represented by Euspongia irregularis, which abounds in the southern seas.

Classification Of more than 20,000 species of animals in Japan, 3,725 representative species are contained in the "Illustrated Book of Japanese Animals," by Mr. S. Uchida and others. In addition there are illustrations of 113 species which have been imported into Japan for various purposes. They are classified as follows :

	No. of Species
I Vertebrata	
A Mammalia	91
B Aves	280

Earthquakes

Italy and Japan are the two countries in the world which are famed for earthquakes. In the frequency of earthquakes in recent years Japan beats Italy. In 1923, when the Great Kanto Earthquake occurred, there were 2,786 perceptible earthquakes and 3,915 imperceptible ones. The number of perceptible earthquakes in the five years, 1927-1931, was 12,476 in the whole Empire. About 45% of them occurred in the Kanto district, Kyoto and Osaka districts coming next with 22%. But such earthquakes as were accompanied with casualties were very few, numbering only three during the five-year period. The seismic history of the country since 1596 records 21 big earthquakes in which the loss of lives amounted to over 1,000 each.

GREAT EARTHQUAKES IN JAPAN IN THE PAST THREE CENTURIES

Date	A.D.	Japanese Year	Districts	Number of Persons killed
Sept. 3	1596	(Keicho 1)	Oita (Kyushu)	708
Sept. 4	1596	(Keicho 1)	Kobé—Osaka district	1,173
Jan. 31	1605	(Keicho 9)	Pacific coasts from Kyushu to Tokyo Bay	8,800
Sept. 27	1611	(Keicho 16)	Aizu (North-east district)	3,700
Dec. 2	1611	(Keicho 16)	North-east and Hokkaido coasts	4,783
June 16	1662	(Kanbun 2)	Central district	800
Feb. 2	1666	(Kanbun 6)	Takada (Niigata prefecture)	1,500
Dec. 31	1703	(Genroku 16)	Tokyo and Tokaido district	5,233
Oct. 28	1707	(Kan-éi 4)	Pacific coasts of Central district	4,900
May 20	1751	(Hōréki 1)	Takada (Niigata prefecture)	2,000
March 8	1766	(Meiwa 3)	Tsugaru straits	1,335
May 21	1792	(Kanséi 4)	Unzen Mt. (Kyushu)	15,200
Dec. 18	1828	(Bunséi 11)	Niigata prefecture	1,443
May 8	1847	(Koka 4)	Nagano and Niigata prefectures	12,000
July 9	1854	(Anséi 1)	Nara to Tokyo	1,057
Dec. 23	1854	(Anséi 1)	Pacific coasts	600
Dec. 24	1854	(Anséi 1)	Kyushu, Shikoku, Isé	3,000
Nov. 11	1855	(Anséi 2)	Tokyo and vicinity	7,000
Nov. 6	1872	(Meiji 5)	Hamada (Shimané prefecture)	600
Oct. 28	1891	(Meiji 24)	Gifu and Aichi prefectures	7,275
Oct. 22	1894	(Meiji 27)	Akita and Yamagata prefectures	720
June 15	1896	(Meiji 29)	Miyagi, Iwaté and Aomori prefectures	27,122
Sept. 1	1923	(Taisho 12)	Kanto district	44,279
May 23	1925	(Taisho 14)	Northern Hyogo prefecture	394
March 7	1927	(Showa 2)	Western Kyoto prefecture	3,017
Nov. 26	1930	(Showa 5)	Shizuoka and Kanagawa prefectures	248
March 3	1933	(Showa 8)	Miyagi, Iwaté and Aomori prefectures	2,805
April 21	1935	(Showa 10)	Shinchiku, Taichu in Taiwan	3,185

The Kanto Earthquake and Fire which occurred on September 1, 1923, was the severest of all the recorded earthquakes in the country in the number of casualties and amount of damages.

The quake started at 11 : 58′ 31″ A.M. on that day, the epicentre being at the bottom of the sea 28 kilometres below the sea level near the mouth of the Sagami river, 139°17, E. Long., 35° 22′ N. Lat. It was a seismic activity caused by a block movement of the earth, and the shock was felt all over the Empire and recorded by all the seismographs of the world. The largest width of the vibration reached to about 8 inches, and the duration of the quake, as recorded by the seismograph in the laboratory of the Tokyo Imperial University, was over three and a half hours.

As to the casualties and damages caused by the earthquake and fire a variety of reports is published. The statistics here given are made out of those published by the **Extraordinary Earthquake** Rescue Bureau of the Department of Home Affairs, and those given in the Empire Statistic Year Book published by the Government.

DAMAGES TO BUILDINGS

(Earthquake Rescue Bureau Figures)

Damage	Number	%
Totally burnt	381,090	54.9
Half burnt	517	0.1
Completely damaged	83,819	12.1
Half damaged	91,233	13.1
Carried off by tidal waves	1,390	0.2
Partly broken	136,572	19.6
Total	694,621	100.0

Of the above Tokyo had 354,453 houses damaged (51%), or 73.4% of the total number of houses in the city, while Yokohama had 94,882 houses destroyed (13.7%) or 95.9% of the total number of houses in the city.

Digitized by Google

CASUALTIES

(Figures from Empire Statistic Year Book and other statistical publications)

	Total	Men	Women	Proportion per 100 population in the district
Killed	44,279	20,953	23,326	0.38
Severely wounded	16,514	9,406	7,108	0.14
Wounded	35,560	20,865	14,695	0.34
Total	96,353	51,224	45,129	0.86

The number of persons killed is usually said to have reached over 100,000, and the Earthquake Rescue Bureau figures give 91,344. But the later statistics given by the Government in the Empire Statistic Year Book seem to be more correct. Of the total number there given as killed, 28,708 were crushed, 15,450 burnt in the ensuing fire, and 121 were drowned by the tidal waves.

No authoritative survey was made in regard to the loss of property and a variety of amounts is given as estimates. Most of them, however, are necessarily exaggerated. But taking the number of destroyed households, the average individual wealth and other factors as guides, the total amount of the loss may be safely said to have reached approximately ¥2,550,000,000.

Earthquake of 1933 The biggest quake of the year occurred in the Sanriku district at 3:31 A. M. March 3. The district, which covers the Pacific coast line of three northeastern prefectures, Miyagi, Iwaté and Aomori, had often been washed by tidal waves due to seismic activities at the sea bottom, the severest loss of life being experienced in 1896. The people were, therefore, fully aware of possible tidal waves when they felt the first shock and immediately hurried to the hills, but the waves overtook them within half an hour or so, drowning 2,805 people and carrying away 15,683 houses, together with over 10,860 fishing boats, loss caused by all damages on houses, boats and farms beeing estimated at ¥18,100,427. The number of casualties was but 10% of those of the 1896 quake, but the area covered and the destruction caused by it was greater.

Formosan Earthquake in 1935 On April 21, 1935 an earthquake struck Shinchiku and Taichu prefectures, Taiwan (Formosa). The shock suddenly began at 6:2' 17" A.M. (Taiwan time or 7:2' 17" A.M. in Japan proper) and lasted nearly one hour. The epicentre was at a point about 10 kilometres below the surface at the mouth of the Daiankei near the town of Taiko, Taichu. The width of the vibration reached from 8 mm. to 16 mm. and the shock was especially strong in a limited district because it occured at a comparatively shallow spot. Records tell that Formosa experienced big quakes in 1655, 1720, 1722, 1861 and 1867, and this was the 46th quake after 1868 and is said to have been the largest so far as the damages are concerned, the statistics of which follow :

DAMAGES AND CASUALTIES IN THE FORMOSA EARTHQUAKE IN 1935

(April 24, Ministry of Overseas Affairs Report)

Casualties:	
Killed	3,185
Severely wounded	9,215
Wounded	1,415
Missing	6
Total	13,821
Damages:	
Dwellings completely damaged	15,292
" half damaged	15,457
" greatly damaged	4,436
" partly damaged	3,380
Total	38,565
Other buildings completely damaged	574
" " half damaged	128
" " greatly damaged	104
" " partly damaged	184
Total	990

Akita Earthquake in 1939 The latest earthquake of any importance in Japan proper struck Akita prefecture on May 1, 1939. The strongest shock began at 2 : 59 p. m. and lasted for about 2 minutes. It was caused by a depression of the sea bottom off cape Nyudo, at a point 50 kilometres to the north-west of the city of Akita. The width of the vibration reached 3 mm., and the whole length and width of Ojika peninsula, west of Lake Hachirogata was rocked with 27 towns and villages on it to cause the following casualties and damages : persons instantly killed 26, heavily wounded 53 ; houses completely turned down 476, half damaged

Digitized by Google

926; and the amount of damage estimated at ¥1,020,000.

National Parks

On October 8, 1932, a committee of 11 headed by Baron Yoshiro Fujimura, which had been conducting investigations for a year under instructions from the Home Office, submitted a report recommending 12 places in Japan as worthy of preservation and development as national parks. They were (1) Mount Fuji and Hakoné, (2) Nikko, (3) Akan, (4) Daisétsusan, (5) Lake Towada, (6) the Japan Alps, (7) Yoshino and Kumano, (8) the Inland Sea, (9) Daisen, (10) Mount Aso, (11) Unzen and (12) Mount Kirishima.

All of them were officially announced as national parks by the authorities in January, 1936.

Descriptions of the national parks follow:

Mount Fuji and Hakoné In the three prefectures of Yamanashi, Kanagawa and Shizuoka in the centre of the Mainland of Japan, the combination of the world-famous Mount Fuji, the five beautiful lakes at its foot and the hot spring resort of Hakoné is to be known as Fuji Park. Mount Fuji, superb, peerless and highest mountain of Japan proper, is known the world over for its beauty. Its perfect cone rises 3,773 metres above sea level. In July and August, crowds of pilgrims and others climb its sacred slopes to the summit.

Below Mount Fuji are the famous five Fuji lakes, all of which are visited by nature lovers because of their scenic beauty.

Few visitors to Japan fail to visit the Hakoné district, noted for its mountain scenery, invigorating climate, hot springs and places of general interest. The district, popularly known as Mount Hakoné, is the crater of an extinct volcano. Lake Ashinoko is famous for its reflection of Mount Fuji when that elusive peak is visible.

Nikko. In the prefectures of Gumma, Fukushima, Tochigi and Niigata in the centre of the Mainland of Japan, 90 miles north of Tokyo, Nikko is famous the world over for its combination of art and nature. The gorgeous shrines and temples are as striking as its cryptomeria avenue, the mountains, lakes and waterfalls. Lake Chuzenji, the largest lake in the park, is extremely beautiful, and the Kégon waterfalls, which serve as an outlet of the lake, are a most striking sight. Beside the lake stands Mount Nantai, which resembles in shape Mount Fuji. In inner Nikko are smaller lakes and also the hot spring district of Yumoto.

Akan Situated in Kushiro province on the Island of Hokkaido, this park contains a wide area of active volcanic mountains, imposing forests and lakes. Lake Mashu, one of the beautiful lakes below the range of volcanic mountains, lies within 10 kilometres of the Teshikaga hot springs. The lake is nearly 20 square kilometres in area, and in its centre lies a small island.

Lake Kutcharo, the largest of the group in Akan Park, measures 76.22 square kilometres in area, with the beautiful island of Tomoshiri in its centre, 12 kilometres in circumference. At the southern extremity of the lake is a small protruding strip of highland called Wakoto Peninsula, at the foot of which is Wakoto hot springs.

Lake Akan, probably the most beautiful of the Akan group, 11.86 square kilometres, has a zigzag shore and, being rich in changes, presents a very pleasing appearance. On the southwest of the lake rises Mount Oakan, an active volcano.

Akan Park is suitable for sight-seeing trips of two or four days from the city of Kushiro.

Daisétsuzan The Great Snow Mountains district, in the centre of the Island of Hokkaido, presents a range of active volcanoes known as the Daisétsuzan range. Because of the great height of the mountains, this is often called the Roof of Hokkaido. Surrounding the mountains are virgin woods over an area of 490,000 acres. The mountains form the source of the Ishikari River, the largest river on the island.

The Daisétsu volcanic range rises in more than 10 mountains, including Mount Tokachi and Mount Sangoku. Many lakes are found on the summits of the volcanoes. Mount Asahi, the highest mountain in the group and the highest in Hokkaido, is 2,290 metres above sea level. Its shape, resembling that of Mount Fuji and trailing far to the foot, is very beautiful to look at from a distance. From its summit can be seen on a fine day all Hokkaido.

Lake Towada In the Ohu district in northern Japan, extending over the two prefectures of Akita and Aomori, Towada Park is distinguished by Lake Towada on the south and Mount Hakkoda on the north. Lake Towada, the second deepest in Japan, is 378 metres deep at the greatest depth. So clear is the water that one can see into it for 18 metres.

The lake, which is 401 metres above sea level is 78.02 square kilometres in area and 46.2 kilometres in circum-

Digitized by Google

ference. In origin and scale, the lake resembles Crater Lake in America, but the beauty and variety of scenery here is said to be far superior to that of the American lake.

The Japan Alps (Chubu Sangaku or central mountains) Extending over the prefectures of Nagano, Gifu, Toyama and Niigata in central Japan, the Hida range of mountains is called the Japan Alps after the European Alps because of its similarity in shape and scenery. Mounts Tsubakuro, Shirouma, Yari, Hodaka and Norikura are some of the high peaks, in the upper valleys of which snow may be found even in midsummer. The region is an excellent place for summer mountain climbing and camping.

Kamikochi, probably the most popular spot in the region, is a flat valley in the shape of an S, 1,500 metres above sea level and surrounded by peaks towering an additional 2,000 metres. Through this valley runs the clear-watered Azusa River. The Kurobé Valley on the north is equally known for its majesty. Steep cliffs of great height stand on both sides, running for almost 80 kilometres from south to north. The region is the source of many beautiful streams and cascades which adorn and add colour to the mountain scenery.

Yoshino and Kumano On the Pacific coast of central Japan and extending over the prefectures of Wakayama, Nara and Mié, Yoshino and Kumano Park has the dual beauties of mountains and sea. The park area includes Ominé and Odaigahara mountain ranges, the Kitayama Valley, Toro Glen, Onigajo and the beach.

Yoshino, noted for its cherry blossoms, and the other mountains in the Yoshino range are from 1,000 to 2,000 metres above sea level. One of the highest of the 70 mountains is Mount Ominé, which is visited by 200,000 pilgrims annually. Mount Bukkyo, 1,915 metres above sea level, the highest peak in the region, commands on a fine day a striking view over the surrounding country. The sea coast within the area extends 80 kilometres. At the southern extremity of the Shio promontory stands a 63-foot Shionomisaki lighthouse. Within the park are the Nachi waterfalls, the greatest in Japan with a height of 433 feet, and 48 other waterfalls of varying sizes.

The Inland Sea This sea park lies between the Island of Shikoku and the Chugoku district on the Mainland of Japan, extending to the three prefectures of Hiroshima, Okayama and Kagawa and consisting of numerous islands of all shapes and sizes between Shodo-shima in the east and Abuto in the west. The seascape is ever changing as one voyages on its historic waters. Most of the trans-Pacific liners traverse it and occasional glimpses of its beauty can be had from the trains between Kobé and Shimonoséki. The sea is famous for its great variety of fish and their superior flavour.

The area between Kitaki Island and Shimotsui, dotted here and there by numerous islands of varying sizes, presents the best scenic view in the region.

The Island of Shodo, the largest of the group, is renowned for its scenic beauty, especially its crimson autumnal leaves at Kankakéi Valley. Yashima is known in history as the spot where the military clans of Genji and Héiké staged a decisive battle centuries ago, ending in the victory of the former.

Daisen In the prefectures of Tottori and Okayama, in western Mainland, Daisen Park is the only national park facing the Japan Sea. It includes, besides Mount Daisen, 1,713 metres above sea level, several peaks of similar height. Mount Daisen is called the Fuji of Hoki, because it resembles Mount Fuji in shape when seen from Shimané prefecture. While its western side is graceful, the northern is very imposing and majestic. Numerous rocks of huge size protrude from the ground. Wide plains around the mountain offer the best skiing ground in the Chugoku district.

Mount Aso In the centre of Kyushu, Aso Park consists of Mount Aso, which forms five peaks. Aso is an active volcano, with the largest and most celebrated crater in the world. Being double-cratered, it has a huge depression measuring 16 kilometres from east to west and 20 kilometres from south to north, in the centre of which lies the central crater. Within the large crater are 11 villages where 50,000 people live.

The five Aso peaks have characteristics all their own. Naka Peak has a crater which is very active and emits smoke which ascends furiously. Half way up Éboshi Peak are hot-spring districts, such as Toshita and Tochinoki, 800 metres above sea level.

Unzen In Nagasaki prefecture, Kyushu, the renowned sulphide hot springs of Unzen, discovered in 1661, annually attract many foreigners and Japanese. Unzen is famous for the medicinal properties of its waters. It is regarded as the best summer resort in Kyushu and is also visited for its wild cherry blossoms in spring, its splendid azaleas in

Digitized by Google

May, its maple foliage in autumn and its celebrated "Silver Thaw" in winter, when trees and shrubbery are coated with ice are equally famous.

Unzen, consisting of the lower peaks of Unzen, Nodaké, Takaiwa, Kusenbu, Torikabuto, Azuma, Hachimaki, and Bizan, has a feminine beauty of mountain scenery in contrast with the masculine grandeur of Mount Aso.

Mount Kirishima In the prefectures of Miyazaki and Kagoshima, Kyushu, Kirishima Park consists of 22 gracefully shaped volcanic mountains with characteristic craters, lakes, plains, woods and forests. The view from the mountains extends as far as Sakura Island in Kinko Bay, and that toward Mount Aso and Unzen in the distance is extremely beautiful. Kirishima is also rich in folklore, which gives it a touch of romance.

To have the best view, one must go up Mount Karakuni, the highest peak in the group, 1,700 metres above sea level. The woods turn into slopes and farther on comes a huge plain. The crater lake is soon reached, and hence a steep road leads to the summit. Three hours of walking are needed to reach Mount Takachiho. In the neighbourhood of Shinnen and Nakadaké, wild azaleas bloom in May, turning the locality into a veritable flower garden.

CHAPTER II

POPULATION

General Survey

The outstanding aspects of the population of Japan are that it has virtually trebled in the past 65 years, that the excess of its birth rate over the death rate is one of the highest in the world, and that its density is such that the land within Japan proper leaves scant room for expansion.

The fourth quinquennial national census, taken on October 1, 1935, showed a total population for the Empire of 99,456,818 including Kwantung province, the South Manchuria Railway Zone and the South Sea Mandated Islands. Though lack of statistics makes it impossible to trace the growth with any accuracy from early days, it has been variously estimated that in the 7th and 8th centuries the population ranged between 5,000,000 and 8,000,000 or 9,000,000. Figures compiled at regular intervals between 1721 and 1846, despite their understatement of the actual population because of certain known omissions, indicate comparative stability at about 26,000,000 for more than a century preceding the Meiji Restoration.

The first estimate of population after the Restoration, made in 1872, was roughly 33,000,000. By 1889, the total was 40,000,000, and the 50,000,000 mark was passed in Japan proper about 1909. Each decade showed an accelerated increase :

1870-1880	5%	1900-1910	12%
1880-1890	7.6%	1910-1920	13%
1890-1900	10%	1920-1930	15%

This increase, it is to be noted, started with the opening of the country to world commerce and paralleled Japanese economic expansion. As means of subsistence gained, so did the size of the population. The death rate did not drop appreciably until recent years, but the birth rate, in contrast with that in other leading nations, became higher, jumping from 17 per 1,000 of population in 1872 to 32.36 per 1,000 in 1930, with a peak of 36.2 in 1920.

But the records of the past 5 years show an adverse tendency in the population of Japan proper, the birth rate falling from 33.00 in 1929 to 29.87 in 1934. With a total area of 382,545 square kilometres, Japan proper has a population density of 181 persons to the square kilometre.

In 1935 the average number of the members of a household in Japan proper was 5.1. It differs according to districts. In the eastern districts, from Toyama, Nagano to Hokkaido, it was from 5 to 6, the north-eastern prefectures heading the list with their average of 6. In the western districts, that is to say, Ishikawa, Aichi, Kyoto, Osaka, Chugoku (western prefectures of the Main Island), and Shikoku, it was below 5, the lowest being Yamaguchi and Kochi prefectures with 4.6. Classified in accordance with prefectures, those prefectures which have big cities show a much smaller average, Tokyo being 4.8, Osaka 4.6, Kyoto and Hyogo (Kobé) 4.7. This phenomenon is evidently occasioned by the social and economic conditions in city life which necessitate a small-family system.

POPULATION OF THE EMPIRE
According to the Census of October 1, 1930

	Total Population	Male	Female	Population per sq. km.	Men to 100 Women
Empire	90,396,043	45,675,654	44,720,389	134	102.1
Japan proper	64,450,005	32,390,155	32,059,850	169	101.0
Korea	21,058,305	10,763,679	10,294,626	95	104.6

According to the Census of October 1, 1935

	Total Population	Male	Female	Population per sq. km.	Men to 100 Women
Empire	97,697,555	49,242,822	48,454,733	145	101.6
Japan proper	69,254,148	34,734,133	34,520,015	181	100.6
Korea	22,899,038	11,662,645	11,236,393	104	103.8
Formosa	5,212,426	2,659,819	2,552,607	145	104.2
Karafuto	331,943	186,225	145,718	9	127.8
Kwantung Leased Territory and South Manchuria Railway Zone	1,656,726	995,447	661,279	441	150.5
South Sea Mandated Islands	102,537	57,333	45,204	48	126.8

The average rate of annual increase of population during the five years from 1930 to 1935 in Japan proper was 14.47 per 1,000; 14.06 in male and 14.89 in female. In Chosen it was 16.90, in Taiwan 23.53, in Karafuto 23.75.

The Quinquennial Increase of Population

	1925–1930	1930–1935
Empire	6,939,114	7,301,468
Japan proper	4,713,183	4,804,143
Korea	1,535,360	1,840,390
Formosa	599,129	620,682
Karafuto	91,442	36,753
	1925–1930	1930–1935
Kwantung L. T. and S.M.R. Zone	273,937	328,752
South Sea Mandated Islands	13,332	32,612

1938 Population Censuses have been taken quinquennially since 1920 by the Japanese Government. For the years in which censuses are not taken the Statistics Bureau has been issuing estimates, as of October 1st annually, of the population in Japan proper.

On October 1, 1938, the population of Japan proper, as estimated by the Bureau of Statistics, was 72,222,700, including 36,182,700 males and 36,040,000 females. The total indicates an increase of 969,900 over 1937.

Among Japan's forty-six prefectures and Hokkaido, Tokyo, with a population of 6,963,900, occupies the predominant position, followed by Osaka with 4,765,000. The northern island of Hokkaido takes the next numerical position with 3,226,400 persons, while the prefectures of Hyogo with 3,094,400, Aichi with 3,045,200, Fukuoka with 2,897,100 and Niigata with 2,034,400 follow in order. Shizuoka rose, in this year, to 2 million level with 2,027,600. None of the remaining prefectures had a population of 2,000,000. The totals for nine prefectures were over 1,500,000; Kumamoto and 13 others had over 1,000,000; Wakayama and eight others over 700,000; Saga and four others had over 500,000. Tottori prefecture with a population of 491,200 was lowest in the list.

The number of cities in Japan Proper on October 1st was 148, with an aggregate population of 25,946,700, or 35.9 per cent of the total population. The percentage gained 0.7 over the previous year.

An examination of the trend of population in Japan Proper since 1920 reveals that the first quinquennial period (1920–1925) witnessed an aggregate increase of 3,770,000, or an annual average gain of about 750,000. The increase during the second period (1925–1930) was 4,710,000, or an annual average gain of 940,000 to 950,000. A still more drastic increase of 4,800,000 was recorded in the third period (1930–1935), an annual gain of 950,000 to 960,000 persons.

On the basis of estimates from the 1935 census, it may reasonably be assumed that the population of Japan proper since that date has been increasing at an annual rate of approximately 1,000,000. Similarly it may be assumed that within the next ten years, the population will advance from the present 70,000,000 level to 80,000,000.

That this remarkable expansion of population is attributable mostly to the differences between the birth-rate and mortality rate, or the so-called natural increase of population, is significant. Since immigation has played no part, the increase simply reflects the natural expansion of the Japanese race.

Over 100,000,000 The Cabinet Statistics Bureau gives another estimates on the population of the Empire of Japan as standing on December 1, 1937. According to the estimates the total number of Japanese subjects, including the inhabitants in Japan proper, Korea, Formosa, Karafuto, Kwantung leased territory, the mandated South Sea Islands and foreign countries, reached 103,087,100. It means a treble increase within 65 years since 1872 when it was estimated at 33,000,000, Details follow;

Races of the Japanese Empire

The Japanese What constitutes the main part of the population of the Empire is the Japanese. Their number, according to the latest national census of 1930, reaches to about 64,400,000 (32,300,000 males and 32,050,000 females), most of whom occupy the main group of the Japanese archipelago, although they are also found scattered in almost every part of the Empire.

Of late, constant emigration and immigration are taking place between Korea and Japan, but the main population of Korea is Korean and numbers about 20,000,000.

The Ainu inhabit Hokkaido, Chishima (the Kuriles) and the Japanese part of Karafuto (Saghalien).

Most of them are found in Hokkaido, especially in the province of Hitaka, their number being 16,000. In Karafuto there were about 1,500 in 1934; formerly they lived scattered along the sea coasts of Karafuto, but the government policy made a point of collecting them in a few prescribed Ainu villages for the purpose of better protection. Those in Chishima are very few in number. In Hokkaido, as a result of daily contact with the Japanese, they are greatly mixed and are fast changing their customs and manners to accord with the fashion of their Japanese neighbours. In 1935 the total number of the Ainu was 16,389. In 1936 it increased to 16,519. There lived 1,445 in Karafuto in the same year.

As to the position of the Ainu in the ethnic system, there is no consensus of opinion. It was, and still is, a conundrum in anthropology. Years ago the view that the Ainu formed a "Race Island" was put forward by Y. Koganéi.

The Gilyaks, whose home is in the Amur region of Siberia, are also found along the Poronai River in the southern part of the Japanese possession in Saghalien. They call themselves "Nickbun" and were reported in 1936 to be 98 in all. Their affinity with other races is not clear, and they are simply classed as one of the palae-Asiatics.

The Orokes, who inhabit the same region in Saghalien as the Gilyaks, are also immigrants from the mainland of Asia. They are a branch of the Tungusic group, but are said to show a considerable influence of the Ainu, Gilyaks and also of the Russians. The number of the Orokes was 287 in 1936.

The Inhabitants of Formosa may be roughly divided into two groups, one is chiefly made up of the Chinese immigrants from Kwangtung and Fukien provinces and occupies the lowland districts and the western half of the island their number being estimated at 5,109,307 in 1936; and the other is made up of the wild hill-tribes inhabiting the mountainous eastern half, and is the more aboriginal of the two. These, on the basis of physical anthropology, ethnology and linguistics, are usually subdivided into eight tribes, namely: Taiyal, Seddaka, Saiset, Tsuou, Bunun, Paiwan, Ami and Yami. They were estimated

Digitized by Google

to be 152,350 and belong either to the Malay or to the Indonesian family.

The Natives of Micronesia Micronesia, which is under our mandatory administration, consists of innumerable small islands, some of which are uninhabited; hence, the native population is only about 50,000. The natives of Saipan, Palau, Yap, Truk, Ponape, Kusaie, Jaluit, etc., constitute the main part of the population. They are usually divided into two ethnic groups. One is known as the Chamorros and is chiefly found in Saipan, although some have emigrated to the the islands of Palau and Yap, and comprised 3,870 in all in 1934. The other, commonly known as the Kanakas, and found scattered in almost every island, numbered 50,524 in 1936.

In addition, it may be said that in the Ogasawara group of islands known as the "Bonin" (corruption of "Mujin" or "Bunin"—uninhabited) there are the naturalized descendants of European and American fishermen, Italian, English, Portuguese, etc., numbering about 120 and these form a sort of foreign settlement of their own.

POPULATION OF JAPAN PROPER BY DIFFERENT NATIONALITIES

(1930 Census)

	In 1930	In 1920
Japanese subjects	64,395,685	55,927,484
Japanese	63,972,025	55,884,992
Koreans	419,009	40,755
Formosans	4,611	1,703
Gilyaks and Orokes	22	31
Westerners in the Bonin	18	3
Foreigners	54,320	35,569
Chinese	39,440	22,427
Russians	3,587	1,714
Americans	3,640	3,966
British	3,144	4,188
Germans	1,228	630
French	694	674
Others	2,587	1,970
Total	64,450,005	55,963,053

Age Distribution

Figures for 64,450,005 persons residing in Japan proper on October 1, 1930, show that those less than 14 years of age, termed juveniles, constitute 37 per cent of the population; those from 15 to 59 inclusive, termed productives, 56 per cent and those of 60 or more, termed the aged, 7 per cent.

The number of juveniles of elementary school age, i.e. from 6 to 14 years, is 20 out of 1,000 of population. Men of 17 to 40 years of age, who are liable to the defence services constitute 36 per cent of the total number of the male; women of 15 to 50, that is, of child bearing age, constitute 48 per cent of the total female population. The number of persons above 14 years of age who come under the judicial law is 66 per cent of the total population.

DISTRIBUTION BY AGE AND MARRIAGE

Japan Proper, on October 1, 1930

Marriages and Divorces

In 1937 the number of marriages in Japan proper was 674,500, an increase of 115,384 as compared with the previous year. The number of marriages per 1,000 population was 9.47 or 1.65 higher than the previous year. The number

Digitized by Google

of divorces in the same year was 46,500 or 333 more than in 1936. The number of divorces per 1,000 population was 0.65 or 0.01 lower than the previous year. Before 1920 the number of divorces surpassed the 100,000 mark in a year and the proportion per 1,000 population was from 2.0 at the lowest to 3.0 at the highest, but it has kept a rate lower than 1.0 since 1920.

Year	Marriages	Divorces	Proportion per 1,000 population Marriages	Divorces

Births and Deaths

The natural increase of population or the excess of births over deaths has become greater with the advance of years. For several years since 1910 the natural increase kept to the 700,000 mark. In 1916 and 1917 it decreased a little, and in 1918 it reached the lowest figure of 300,000, largely due to the prevalence of a severe influenza epidemic. In 1919, however, the increase regained, reaching the 500,000 mark, and it continued to increase till the 940,000 mark was attained in 1926. There have been ups and downs since, but 1932 was a record year, registering an increase of 1,007,000, the million mark being attained for the first time. In 1935 a new record was established with 1,028,768. But 1936 recorded 871,691.

BIRTHS AND DEATHS

Japan Proper

				Rate per 1,000 of Population

Urbanization

As in other countries where industry is of importance, Japan has experienced a shift of population from the country-side to the towns and cities. Concur-

Digitized by Google

rently, municipalities have amalgamated to form larger units. The following tables show the trend toward larger urban centres; the first, the increase in the number of municipalities of large population, and the second, the increase in the proportion of the population residing in these larger municipalities. For 1920, 1925, 1930 and 1935, the figures are based on the national censuses of these years, but the earlier figures depend on less comprehensive statistics compiled by local authorities.

CITIES, TOWNS AND VILLAGES CLASSIFIED
According to Population

	1935	1930	1925	1920	1913	1908	1903	1898

1. For administrative purposes, all of Japan proper is divided into cities, towns and villages, persons residing in what would be known as rural districts in other countries belonging, as the case may be, to the nearest cities, towns and villages.

In October, 1935, there were 127 cities in Japan proper, which meant an increase of 4 every year since the 1930 census. According to the census on October 1, 1935, the number of major cities which have more than 100,000 population was 34, including 4 cities which have more than 1,000,000, Tokyo leading others with 5,875,667. The total urban population comprises 22,655,920 or 32.7 per cent of the population of Japan proper. In 1938, there were 148 cities with an aggregate population of 25,946,700 or 35.9 per cent of the total estimated population 72,222,700 on October 1. The rapid growth of cities may be proved from the fact that the rate of increase of population in cities is much higher than that of Japan proper, as is shown below:

	Population		Quinquennial Increase		Rate of Increase	
	Japan proper	Cities	Japan proper	Cities	Japan proper	Cities
1925	59,739,822	16,606,809	3,773,769	2,697,504	6.7	19.39
1930	64,450,005	19,439,405	4,713,183	2,832,596	7.9	17.06
1935	69,254,148	22,655,920	4,804,143	3,216,515	7.4	16.54
1936 (estimate)	70,258,200	23,620,200				
1937 („)	71,252,800	25,109,400				
1938 („)	72,222,700	25,946,700

NUMBER OF CITIES, TOWNS AND VILLAGES IN JAPAN PROPER

(On April 1, each year)

	Cities	Towns	Villages
1889	39	715	12,632
1898	52	1,169	13,557
1908	66	1,164	11,233
1913	69	1,246	11,033
1920	83	1,366	10,782
1925	100	1,510	10,451
1930	109	1,702	9,980
1934	124	1,683	9,788
1935	127	1,702	9,721
1936	129	1,720	9,662
1937	141	1,707	9,568

A village is an administrative unit consisting of several villages.

Emigration

History Though there are records of Japanese having gone abroad for trade and residence in the latter years of the 15th century and the first half of the 16th century, the rigid laws against leaving the country during the period of seclusion, from 1636 to 1858, reserved the problem of emigration for modern times. As a result of negotiations between the Japanese Government and the Hawaiian Consul in Yokohama, 153 emigrants went to Hawaii in 1868 to work on sugar plantations. The venture was a failure, however, and not until 1885, after the visit of King Kalakaua of Hawaii to Japan in 1881 and the conclusion of treaties regarding travel, emigration of labourers and navigation, was there further emigration to the islands. In that year, 951 went. Their success encouraged an increase in the ensuing period, and by 1894 approximately 30,000 Japanese entered Hawaii.

Because of the rapid development of emigration, the Government turned the business over to private companies, which soon became numerous. Regulations to safeguard the interests of the emigrants were enacted in 1896. The companies sent 10,000 to Hawaii and about 1,000 each to Australia and Canada in 1897 and 23,000 to Hawaii, 3,000 to the United States, 1,700 to Canada, 790 to Peru and about 2,500 to other countries in the following year. But the annexation of the Hawaiian Islands by the United States in 1898 and the establishment of the Territorial Government in 1900, brought

Digitized by Google

the application of American law against the entry of contract labourers, and dealt a great blow to the companies.

By 1904, the movement of Japanese from Hawaii to the mainland of the United States had assumed sizable proportions, as had emigration to that country directly from Japan. In the so-called Gentlemen's Agreement, arrived at in 1908, Japan agreed to restrict the issue of passports to nationals wishing to enter the United States. The United States Supreme Court decided in 1922 that Japanese are ineligible for citizenship, and two years later the Quota Immigration Act was passed, containing a clause denying the right of entry into the United States for permanent residence of any person not eligible for citizenship. Australia, New Zealand, South Africa and Canada also provided, by various methods, for exclusion of Japanese.

These obstacles to entry into the Anglo-Saxon countries had two results, first, an abrupt decrease for a few years in the number of emigrants and, second, the discovery of new outlets. Several South American lands, notably Brazil, offered inducements. The Government adopted a positive policy of sending emigrants to quarters where they were not unwelcome, and in 1921 a subsidy was given to the Overseas Enterprise Company (Kaigai Kogyo Kaisha) to arouse interest in emigration. Encouraged by this change in policy, emigration associations sprang up one after another in the prefectures, and plans were made to purchase tracts of land in Brazil for colonization. To such land, the Shinano Emigration Association (Nagano prefecture) sent 450 emigrants in 1925.

Enactment of the Emigration Association Law in 1927 resulted in an increase of "independent" emigrants, quite different from the labour-contract emigrants which had constituted the bulk in earlier years. Prefectural emigration associations set up under the provisions of this law organized a federation which co-ordinated the buying of Brazilian land. A home for emigrants was opened in Kobé, the main port of embarkation. Companies specializing in South American colonization came into being. Part of the reason for establishing the Ministry of Overseas Affairs in the Government in 1929 was to provide an agency for the administration and control of matters pertaining to emigration and colonization.

Movement The following table shows the movement of Japanese travellers and emigrants.

NUMBER OF PASSPORTS ISSUED

Year	Total	To Men	To Women
1925	22,176	15,628	6,548

CHAPTER III

OUTLINE OF HISTORY

Ethnologic Beginnings

According to modern scientific research it seems almost certain that Japanese tribes lived on these islands at least as early as 2,000 B.C., in the latter part of the New Stone Age. It seems probable that yellow folk from the mainland of Asia, the natives of some southern islands, and possibly some kind of white-skinned race from the northwest, drifted to the Japanese islands, where they found a milder climate and more fertile soil than in their homelands, and formed a mixed race which we may call the Yamato Tribe and their blood became so well blended in the course of time that many think the Japanese people, their descendants, to be homogeneous.

They lived mostly on seashores or riversides. Their shell-mounds are rich in relics of those early days. They dug caves in the hillsides and pits in the flat ground for their dwellings, used stone tools and lived on natural food such as game, fish and shell-fish.

In the 3rd century B.C. the Indo-Chinese brought rice to the islands and the natives learned to cultivate and eat it. By this time a primitive agricultural life must have begun, and according to one of the oldest Chinese records on Japan the islanders already had a knowledge of silk-making even in such a remote period. Four different styles of clothing seem to have been prevalent, that of the Ainu, Tunguse, Indo-Chinese and Huns, although there were some tribes who went naked. Judging by the clay images or idols they left behind them, the Ainu clothes consisted of an upper and a lower garment, the upper garment of the women being open in front, while that of the men was not. The dress of the Tunguse much resembled the Korean in style and they were fond of using jewels or stone ornaments.

They lived in groups, forming villages which consisted in some cases of several hundred households. They seem to have had a primitive communal life, each tribe or group being firmly united by ties of blood and belief. But there had appeared as yet no political organization or system and there was a continual stream of immigrants from the continent. Clan and tribal fighting and alliances gave opportunity for mixing blood. By the beginning of the Christian Era the Ainu and the ancestors of the Japanese, mainly Tunguse by descent, gradually settled down on the islands, the former living in the northeastern half and the latter spreading over the south-western half.

Age of Traditions
(660 B.C.–531 A.D.)

The period of 1,000 years from the Emperor Jimmu, who founded the Japanese Government in 660 B.C., to the Emperor Keitai, who reigned from 507 to 531 A.D., may be called the Age of Traditions of Japan. The first book of history "Nihonshoki" (Japanese Annals) which was first compiled in the 28th year of the Empress Suiko, and the second oldest record "Kojiki" (Antiquities) which appeared about one hundred years later, tell of some still older manuscripts which furnished them with materials. But of these no trace remains. These two books which are commonly called "Ki-Ki" collectively contain traditions long cherished by the islanders, although there are many fictions mixed or intermingled in them. Careful study of these records reveals the ancient life of the Japanese after the New Stone Age and at the beginning of the agricultural period.

Beginning of Shintoism People in this age formed large families and the clan system prevailed. In many families the succession followed the maternal side, clan councils were called and patriarchs were elected. The number of clans was about one hundred. Shintoism, though in the most undeveloped state, was already a creed; people revered their forefathers and worshipped their own family gods, and the members of each clan were united in the worship of their own particular god, gaining thereby a more vivid feeling of belonging to one and the same blood. In the Imperial House, the Emperor Jimmu instituted religious ceremonies for his Divine Ancestors, who became the objects of worship of the National Shintoism in later ages, and his successors

Digitized by Google

followed his example and prayed to the gods for the welfare of their beloved nation. Before Chinese models were adopted the ancient government of Japan was a very simple theocracy, and ritual observances and public affairs were one, as the Japanese "Matsurigoto" may mean either the administration of state affairs or religious ceremony.

Political Affairs In 87 B.C. the Emperor Sujin sent armies to the remoter central and western districts and subdued all the opposing tribes. In the first century A.D. the Emperor Keiko sent Yamato-Takeru or some generals to the farthest west and east, and succeeded in bringing the whole land under his sway, sending his sons to be the rulers over those subdued districts. Later the Emperor Seimu divided the whole land into territories and prefectures for the convenience of governing them. Sujin and Suinin encouraged industry and commerce, the nation became rich and national power was so augmented that the small kingdoms in the Korean peninsula came one by one to be its tributaries. It was through these small Korean kingdoms that a knowledge of the religion and culture of the greater Oriental nations first reached Japan. In 285 A. D. Confucianism with its important moral precepts concerning righteousness, loyalty, filial piety, and love, was officially introduced into the country. In 552, during the reign of the Emperor Kimmei, the public introduction of Buddhism with its teachings on cause and effect opened up new vistas in religious and philosophic thought.

Civilization Introduced From the remains of this period it can be inferred that the Japanese people whose settlements extended from Kyushu to districts near the present-day Kyoto had risen above a barbarous life long before the first century of the Christian Era. Their shell-mounds contain many bronze utensils which correspond to the Chinese productions of the Han Dynasty (206 B.C.-221 A.D.). Do-taku which seem to have been used as musical instruments or kept as a kind of treasure have been found in the districts extending from the western end of the Main Island to Totomi and Kaga provinces near Nagoya and in Shikoku Island. They were found with relics of the so-called Yayoi style which characterizes the works of the original Japanese as distinguished from the Ainu, and tell of early Japanese intercourse with the continental countries. Do-ken or bronze swords of different shapes have been found in the provinces of Kyushu, districts around the Inland Sea, the provinces of Aki, Izumo, Owari and Shinano and in Shikoku Island.

Japan had tributaries in Korea at this period, but, at the same time, heads of large families in Kyushu and Loochoo had some relations with the Han Dynasty as local tributary lords. Considerable numbers of continental people came to the islands either individually or in large bodies, and the civilizations of China, India and Korea were constantly introduced to the islanders or brought in by the immigrants themselves so that there had really been several centuries of preparation before the formal or official reception of Chinese books and culture in the 3rd century at the Central Court in Yamato province, Nara prefecture.

Japanese Traits In those days Japanese characteristics and tribal traits were already established. The mild climate and beautiful natural features of the islands and the surrounding seas exerted ineradicable influences on the nature of the inhabitants. From such an early period the islanders, economically self-supplying and self-sufficient, enjoyed comparatively peaceful lives without much danger of being invaded by outside political powers. Consequently they became admirers of the realistic world, highly optimistic with pragmatic ideals; they had deep appreciation of natural life and a religious belief full of light. Their mode of action was sprightly, innocent and active. Loyalty to one's lord and filial piety were their two main principles of morality fostered from the remotest past; next in importance came valour in the highest sense of the term. There was no distinction in the position of the sexes and able women assumed high places in public affairs.

Primitive Literature There were written numerous local histories and genealogies of the Imperial Court and clans, and stories of heroes of victorious battles were earnestly listened to at their gatherings. They had ballads and a crude form of poetry which later came to be called waka, the metrical arrangement being 5-7 or 5-7-7, instead of the later 5-7-5-7-7. The ideas expressed were simple, pure, and mostly concrete, immediate feelings being put into metre. The subject matter, in common with that of primitive peoples in other parts of the world, being that of women, war, and saké. Songs in praise of the natural beauty of the scenery were rarely sung.

Digitized by Google

No Pastoral Life The islands, severed as they were from the continent, were unsuited for raising cattle, and the ancient Japanese people had no experience of a pastoral life. Excavation of mounds gives no indication of it, while the undeveloped legs of the Japanese seem to suggest something of their ancestral habits.

With the progress of agricultural life the oldest clan system, which had no class differences, began to undergo changes because of the increase of population and consequent need of new land. Clans began to separate into branches, the latter leaving the parent stock and going out to get new lands. In many cases land was obtained by violence and there arose the connection of master and subject between the conqueror and the conquered. Blood relation among the people widened to local relation and there appeared ruling clan heads to control and represent the districts or provinces. Soon these ruling families transformed their temporary power into a hereditary one. The primitive or natural system of common property was transformed to that of private property. Powerful clans had serfs as property and subordinate clans or subjects paid tribute.

Age of Foundation
(532–709 A.D.)

By the 6th century A.D. Japanese social and economic conditions were well suited for the introduction and appreciation of the Chinese civilization of the brilliant ages of the Sui and Tang Dynasties.

Political Events With religion, other things such as painting, sculpture and architecture were gradually introduced and in the sixth century Prince Shotoku-Taishi, striving for the promotion of learning, religion and art, tried his best to make a radical improvement in the state administration and in the social life of the people. His work was a forerunner of the Taika Reformation.

In the meantime, there arose troubles among the clans which had power in the Government, their conflict becoming greater with the advancement of civilization. Two of the most important of these clans, Soga and Mononobé, came into violent collision over the question of adopting Buddhism as the national religion. The former finally got the upper hand, but so abused its power that it stirred up the opposition of Kamatari Fujiwara, a loyal subject, and Prince Naka-no-Ohyé, who later became the Emperor Tenji. The Soga power was suppressed in the year 645; this was the first step toward the Taika Reformation.

Emperor's Power Reduced As a natural development land became divided among the Imperial house, the clans and the temples. The Imperial estates were obtained in various ways, and consisted of, first, land owned ever since the time of the Emperor Jimmu; secondly, land newly cultivated by the farmers who served the august family; thirdly, estates presented by local nobles; and fourthly, memorial lands for the dead members of the Imperial family.

Clans owned their estates, either by natural right, conquest or as prizes for merit. Shinto shrines and Buddhist temples also possessed their own glebes, given them by nobles as offerings. The patriarchs or clan heads in the country districts began to possess a great number of people and large estates and enrich themselves by the labour of their serfs. Their wealth gave them influence and power and they became local lords. The clan system allowed high officials of the Court and the powerful families in the provinces to exercise almost absolute power over their own territories. The emperors ruled the people indirectly, all the official positions being hereditary. This system gave birth to several political vices or abuses, and the Imperial authority became much reduced. The excesses of the Soga clan showed clearly the injurious effect of this system, and the necessity of ending it.

Social classes The aristocrats of this period were the clan heads, an idea of whose life may be formed from the luxurious relics found in their large tombs or mounds in the district around Nara and Kyoto. Next came the direct subjects of the Imperial House whose occupation was mainly agriculture. The third class, which was the largest and constituted the main productive element of the nation, consisted of the subjects of the local clan heads. They worked for their respective clans at clothes making, ceramics, brewing, the manufacture of lacquer goods, furniture making, etc., besides being farmers, fishermen and hunters. The lowest class of people was that of the "yakko" or serfs who served in the lowest kind of occupation for the aristocrats. They were often presented to shrines and temples as slaves. The slaves in Japan originated in captives taken from Ezo and Korea, and to them were later added those who had sold themselves for monetary reasons. Once enslaved, their social status

Digitized by Google

remained unchanged unless emancipation came through the benevolence of their lords or paid for by themselves or some other people. The number of slaves, however, was rather insignificant.

The Taika (Taikwa) Reformation When the Soga family were destroyed, the Emperor Kotoku started a plan for a reformation, appointing the Crown Prince Naka-no-Ohyé to the head of the council which was composed of Kamatari Fujiwara, Kurahashimaro Abé and other great scholars of the time. The Crown Prince, with Kamatari as his right hand man, studied the Chinese system of government and made plans for a revolutionary change of politics for the welfare of the people. In the summer of 1305 from Jimmu (645 A.D.), he introduced from China the system of "nengo" or year-names, and called the period Taika or "Great Reformation." This was indeed only seven days after the death of Soga. This was the first of the three great changes that Japan has experienced in politics since the founding of the nation. The second was the establishment of the Shogunate at Kamakura, 1192, and the third was the Meiji Restoration, 1868. In the second year of Taika the Imperial Edict of the Reformation was proclaimed. Some of its provisions were as follows :

(1) To bring all the private lands into public possession ; (2) to divide the confiscated lands among the people, taking a census and fixing reasonable taxes; (3) to fix divisions of Kuni, Gun and Ri for the convenience of administration, putting officials in each division.

These changes were practically carried out, and the clan system was entirely broken, thus bringing about a centralization of political power according to the Chinese pattern. The following is but a summary of the vast Reformation :

(A) Public land and people (citizens). (1) The people had, hitherto, belonged to the powerful gens and families and had been kept in a condition not far removed from serfdom. The land had been the private estates of the gens, and wealth had been almost entirely accumulated by them alone. In this reformation the land was all confiscated by the Central Government, and the people became direct subjects or citizens of the Emperor ; so was the clan system destroyed. (2) The public land was distributed to citizens evenly. A census was taken first and all the names of the people were registered and every male over the age of five was given two "than", or a little less than half an acre of land, while a woman was given two-thirds of this. This land was returned to the Government when the holder died. The registration was renewed every sixth year. (3) Three taxes were newly imposed : one was on the land, being two bundles of rice on each "tan", the second was a requisition of labour, or else twelve feet of cloth or about two-and-a-half bushels of rice instead, from each house, and the third was a certain proportion of the special products of the locality.

(B) Centralization of government. The reformation of Taika was specially concerned with the centralization of government and the abolishing of local divisions of the clan system. To accomplish this aim, a central government had to be established on a very strong basis. In 649, the Emperor ordered the establishment of a central government consisting of eight departments, modelled on the Tang government. In the country districts the old officials were replaced by new state and country governors, horse stations were established for the convenience of travel and traffic, barrier-gates were set up in important places, and defensive preparations were made in the remotest districts.

(C) Appointment of men of ability. The third merit of the Reformation was in the appointment of able men from among the people to important positions. Under the old clan system even the officials were hereditary and this gave birth to various political abuses. This hereditary officialdom was entirely done away with by the Taika Reformation, and any one who had real talent might become a high official, no matter to which or to what kind of clan or house he belonged.

Prince Naka-no-Ohyé, who headed the council of this great revolutionary improvement, declared, "As there are not two suns in the sky so there cannot be two kings over one nation, and the Emperor must be the only one who governs over and controls his people under heaven," and he set the first example to the people by handing over his own estates and subjects to the Mikado, thereby speeding the Reformation.

A Premature Trial The Taika Reformation, however, could hardly be considered as reformation of a government which had already been well organized, but rather as an attempt at the formation of a real central government. Corruption within the old clan system had made a purging of the social and political system of the country urgent.

Digitized by Google

Chinese cultural and political influence which stimulated the longing in the hearts of the authorities for the construction of a shapely government was a second cause of the reform. Unity and centralization of administration was completely exemplified by their big neighbour, and the young minds of the Japanese officials and nobles, entirely caught by its brilliancy, were rather too impatient to make fuller investigations on the adaptability of Chinese institutions to Japan and the Japanese of the day. The Taika Reformation, therefore, was hardly a success so far as its economic system was concerned and the formal institutions mentioned in (A) soon began to collapse.

Its Lasting Merit But the fundamental and imperishable meaning of the Taika Reformation is that it was the first systematic organization of the Central Government and the establishment of the spirit of national unity.

It was in this age that the whole of Japan was united into one. The Ezo tribes in Hokkaido Island and the inhabitants of the southern islands came to pay homage to the Central Government, and Buddhism was propagated among the northern islanders and the Kyushu tribes in the south as a cultural enterprise of the Government.

Taiho Law (Taiho-ritsu-ryo) After half a century, or in 701, the Taiho Law, which completed the work of the Taika Reformation, especially in the organization of the Government, was promulgated. The construction of the Daijokan (the Great Government), which was regulated in the Taiho Law, and revised once in 718, was the form of central government which continued till the Meiji Restoration, when it was revived in power and called the Dajokan. The Government consisted of the Daijo Daijin, the Sa (left) Daijin, the U (right) Daijin, four Dai Nagon, three Sho Nagon, four secretaries, ten scribes, three Sa-benkan, and three U-benkan.

The Daijo Daijin was the tutor and personal counsellor to the Emperor, and had no fixed office. In view of the importance of the position it was not filled when no suitable man was to be found. The Sa Daijin was the prime minister and controlled all the administrative offices and might over-rule the decisions of the Danjodai (a kind of court of administrative litigation).

The U Daijin took the work of the Sa Daijin in his absence and his responsibility was the same as that of the Sa Daijin. The Dai Nagon acted as counsellors in national affairs with the three Daijin just mentioned and assisted them, directly reported all political affairs of importance to the Emperor, handed Imperial orders to the departments, and performed the offices of Imperial attendants. The Sho Nagon administered affairs of minor importance, the secretaries and scribes administered the business concerning public documents and Imperial edicts, etc. The Sa (left) Benkan administered the following four departments: the central, the ritual, the administrative, and the civil. The U (right) Benkan administered the other four departments: the military, the judicial, the treasury, and the Imperial House. That is to say, the practical administration of the eight departments was executed by the Left and Right Benkan in accordance with the decisions and directions of the three Daijin and four Dai Nagon.

Learning and Religion A century around the Taika Reformation was the period when the Government was busy also in the study of Chinese literature, importation of continental culture, and compilation and promulgation of new laws. It was an age of laying foundations for the future progress of Japanese civilization. This study of continental cultures did not stop with that of China, but ancient nations west of China became tutors of the Japanese. Among the treasures which were accumulated by the Emperor Shomu (724–749 A.D.) and kept in the Shoso-in Museum at Nara, there are many art products of Rome and Persia. The area represented by the treasures practically covers all the civilized countries of the Orient and a large portion of the Western world.

Systematic education of the young began with the building of Horyuji temple (see Chapter XXVIII). With the compilation of the Nihonshoki and Kojiki, Shintoism was formulated as the national religion. As to the nature of Shintoism and its philosophical analysis as a dogma opinions are divided, it nevertheless developed in this age from mere nature-worship to ancestor-worship, cosmogony and anthropomorphism, including a germ of the idea of a central diety of the cosmos in the belief in Amé-no-minaka-nushi-no-kami. On the other hand Buddhism was eagerly taken into the lives of the upper class people who had power to assimilate it.

Nara Age
(710–793 A.D.)

Golden Age of Buddhism After the Taika Reformation in 646, the Govern-

Digitized by Google

ment rather avoided the trouble of intercourse with the Korean Peninsula and concentrated their power on the better administration of home affairs, encouraging intercourse with China in order to bring Chinese civilization more into Japanese life, and 60 years later founded the city of Nara as the capital, in Chinese style. For 70 years following its founding, it was an age of imitating Chinese things. Buddhism won the faith of all classes of the people and developed and expanded among them with great rapidity. This was the golden age for Buddhist fine arts, existing specimens of which make today the international treasures of old Buddhism. The nation was prosperous and the people enjoyed a happy life such as they had never known before.

Throughout most of the 8th century Nara was the Imperial capital and towards the end of it Japanese civilization, favoured by peaceful social conditions, began to assume its own form and characteristics. The Japanese poetry, waka, took a definite style and the range of subjects handled in the poems came to include all phases of life and nature as we see in the Mannyoshu collection of waka of this period (See Chapter XXXV).

The use of abbreviated forms of Chinese characters was begun in this period for the convenience of copying books, in an age without much printing, although block-printing was introduced from China by 770 A.D., and prepared a way to the invention of Kana characters in the following Heian Age.

Division of the Rich and the Poor As mentioned above, the economic plan of the Taika Reformation soon began to collapse. It was not, however, a return to the old patriarchal system but an advance to feudalism.

The even distribution of land under the Taika Reformation proved in practice insufficient and many farmers were compelled to obtain more land by cultivation of waste areas or to fall heavily into debt. On the other hand, the nobles or former patriarchs of larger clans, the Court officials and priests began to accumulate special prize lands, gift lands and subject tenants, and people of the upper class became landed proprietors with wide estates which were called "Shoén".

For the cultivation of new arable land, labour and the digging of water courses were required, so such land naturally came into the hands of the wealthy people. Besides the addition of newly cultivated land they enlarged their estates by purchasing the land of the poorer people, confiscating mortgaged land and conquering weaker landowners by force. This tendency in the rural districts went its course unchecked, while the Central Government was occupied with political and diplomatic affairs mostly concerning matters in the capital cities of Nara and Heian (Kyoto), and Court nobles gave themselves up to luxurious living.

Korea, China and Japan (660 B.C.-1019 A.D.) From the time when these islands were first populated the inhabitants of the Korean Peninsula had intimate relations with the islanders. Especially, according to traditions, was this the case with the south-eastern part and the Izumo district. At the time of Sujin the southern part of Korea became a Japanese protectorate, but its eastern neighbour, Silla, scorned Japan until it was subdued by the Empress Jingo in 200 A.D. The western half and lands in the north also came under the influence of Japan until finally the whole peninsula became tributary to her. These small kingdoms mostly acknowledged the Japanese authority, but sometimes they rose in rebellion and Japan frequently had to send armies to the peninsula, till finally the Governor's office was destroyed by Silla in 562. Silla soon became the master of the whole peninsula, conquered the other small states, and entered into good terms with the Chinese Government. The ruling power of Silla was usurped by another dynasty in the 9th century. Japan interfered in these affairs when suitable chances offered, but all her attempts were in vain and she had lost her last trace of influence by the year 936.

The northern part of Korea had once been a territory of China in the second century B.C. Intercourse between the Japanese and Chinese people had already started in those days, and during the years in which the Korean peninsula was tributary to Japan the trade and travel between the two nations became greater and more frequent; many Chinese scholars and artists became naturalized in Japan and worked for the Government in the fields of literature, art and general technique. Some Emperors sent delegates to south-eastern China to get teachers of weaving and sewing.

In 607, when Shotoku Taishi was regent, an ambassador was sent to the Sui Dynasty and friendly official intercourse was opened. Later, when the Tang Dynasty replaced the Sui, diploma-

Digitized by Google

tic relations were still unbroken between the two nations and many a young man and monk went to China for study. The culture and civilization of the continent flowed into Japan and greatly influenced her politics and social life. In the Era of the Emperor Tenji, this intercourse was once checked by difficulties with Korea, but the Tang Emperor sent his delegates again to Japan to re-establish friendly relations, and they were accordingly restored. During the Nara Age, especially, travel was most frequent between the two countries, and science, religion, the fine arts, architecture and forms of living were all taken from China, such imitation continuing till the beginning of the Heian Age. Chinese civil wars proved a hindrance to these friendly relations and the Emperor Uda stopped the sending of delegates in 894.

In Manchuria a strong nation appeared in 713 and invaded northern Korea, and started some trade with Japan. Another arose later and came down even to the central part of the peninsula. Still another dynasty then gained control over much of eastern Asia and tried to invade these islands, but was defeated by the Japanese army in 1019.

Héian Age
(794–1192 A.D.)

Fujiwara Despotism The Emperor Kammu changed the capital from Nara to the new city of Heian, the present Kyoto, in 794, and instituted a new era. For several decades after that the Imperial sceptre retained its power. But from the middle of the 9th century, the house of Fujiwara became closely related to the Imperial House, and began to assume regentship of the country. Taking all political power from the Imperial House, the Fujiwaras gradually concentrated it in their own hands and planned only for the benefit of their family and relatives. Their despotism reached its climax with Michinaga Fujiwara in the 10th century.

In those days the Fujiwara family gave themselves over to luxury, and greatly influenced the city life of Kyoto, making it indolent and vicious. But on the other hand literature and the fine arts made special progress. As the result of the cessation of sending delegates to China Japanese habits and inherited ideas regained favour and developed a style which was most graceful. Buddhism now assumed a strong and influential position not only among the people at large but also in the Court. The Enryakuji Temple of Kyoto and the Kofukuji Temple of Nara especially played a great part in this new tendency. It was noticeable that by this time the imported religion was largely transformed and Japanized in character.

Rise of Samurai Class Another remarkable phenomenon of this age was the rise of the samurai, the warrior class. The direct rule of the Emperor, in consequence of the weakening centralization of administrative power, was declining. In the local districts, the private lands owned by the aristocratic families were increasing year by year, and the orders issued by the Central Government were disregarded in those private territories. Local affairs fell into confusion, and robbers stalked abroad in the towns and villages. Wealthy landowners in the villages hired and fed soldiers for self-defence, and these farmer-soldiers finally became samurai, men whose profession was fighting. Sons of aristocratic families who could not get official positions also became soldiers, striving after power. Soon they became really powerful, being specially rampant in the farther districts, where they rebelled against local orders. The bodyguard of the Court, hopelessly impotent, was useless for real battle, and the samurai rebellions were suppressed only by other samurai bodies. The princes and nobles also hired samurai to guard them and to further their political feuds. Warriors were encouraged to become ever more skilful in the practice of arms, and it was quite natural that in such a course of affairs important positions in governmental offices should go to members of the samurai class. Among them the most famous ones to receive such positions were members of the Minamoto (Genji) and Taira (Héishi or Héiké) families.

In the middle of the 11th century, the Emperors gathered patriots to restore the Imperial power to the old status and suppress the Fujiwara despotism. Finally in 1156 the Fujiwara power was completely broken and overthrown by the Genji and Héishi warriors, who were much honoured in consequence by the Imperial House. Before long, however, these two samurai houses became rivals and in 1159 Kiyomori Taira (Héishi) won the day against Yoshitomo Minamoto (Genji). Kiyomori had rare ability and great ambition, and forgetting that he was but a samurai followed the examples of Fujiwara and became himself another despot. For his wilful behaviour he was hated by all classes of the people, and Yoritomo Minamoto, son of the defeated Yoshitomo, rose on the tide of general bad feeling against

Digitized by Google

the Tairas, and the whole Taira family was defeated and drowned at the battle of Dan-no-ura in the Inland Sea in 1185. It was Yoritomo Minamoto who first established government by the Samurai class.

Literature At the end of the Nara Age an abbreviated form of Chinese characters began to be used among scribes. In this Héian Age the Katakana, a Japanese syllabary of simple 'square' characters was derived from the Chinese ideograms, and lastly Hirakana, a smoother and more fanciful style of Kana was invented and came to be used first among educated ladies and then by gentlemen also. Chinese sentences had monopolized the literature of former ages, but from the first quarter of this period pure Japanese sentences in the new Japanese alphabet appeared and gave an impetus to the rapid spread of waka composition and beautiful Japanese stories like the Takétori-monogatari and Isé-monogatari.

The culture of this age had not yet reached the rural districts and common people, but existed only in the larger cities and a number of towns and among the aristocratic class. The kulturträger, the bearers of civilization and culture of the age, were court nobles, government officials, priests and monks, and their families. It may be going too far to say that Heian was the only city of the Empire in those days, for there are evidences of the existence of some local market towns and trade ports. It is nevertheless true that there was a great difference in grade of civilization between the capital and the rural districts. The intelligentsia in the capital kept political power and literary heritage to themselves and their successors, their living being supported by the contributions and tenant fees from their country estates. They lived a luxurious and easy monotonous life as is shown in the Genji-monogatari by Murasaki-shikibu, a woman novelist (See Chapter XXXV). But at the same time Japanese literature made wonderful progress in this age.

Education School education was undertaken by the Government along definite lines in the city and local districts. In the city of Héian there was a Dai-gaku, (school of higher learning), which took in 400 boys of higher officials. There were 143 higher officials and 850 lower officials in the city. In the districts there were established Kokugaku, provincial schools, open mainly for the boys of local officials. At Dazai-fu in Kyushu the Gakugyo-in, or institute of learning, was established for the provinces of the northern half of the island. The main course of study in these schools was related to national politics based on the teachings of Confucius. But literature, music, physical science, pharmacology, astronomy, mathematics and penmanship were not neglected. Some of the local schools were of a high educational standing and sent out able scholars. Children of the princes and court nobles were taught by private tutors. School education especially flourished in the Enryaku, Konin and Showa eras, under the Emperors Kammu, Saga and Nimmyo respectively. The building of the new capital of Héian gave rise to a new spirit of enterprise among the people and broader humanistic ideals began to show themselves, with sincere aspirations for the advancement of civilization. Many a young student went abroad. Prince Shinnyo, a young monk of the Shochoji temple in Izumi province, (present Osaka-fu) went to the Tang capital, and started from Rusha to Raetsu, near Singapore, for the study of Buddhism, but died on the way. The needs of the time gave rise to many private schools. Some representative ones were the Bunsho-in of Séiko Sugawara, the Kangaku-in of Fuyutsugu Fujiwara, the Gakkan-in of Tachibana, the Shogaku-in of Yukihira Arihara, and the Kobun-in of Kiyomaro Waké. The Sugawara family especially produced a succession of first class scholars, and many able young men came into the Bunsho-in. This study of foreign learning continued from the previous ages to the middle of the era when the Emperor Uda stopped the sending of delegates to China.

With the slackening interest in Chinese cultural studies early in the 10th century the Government schools were gradually reduced in numbers and influence, especially, also, as the power of the Imperial Government was dwindling and the Fujiwara connections were beginning to monopolize all official positions, leaving outsiders without hope of preferment. The Daigaku-in in Héian was closed after the buildings (five blocks of classrooms and one storehouse) were burnt down in the fire of 1177. Learning became a hereditary privilege with the growth of reactionary reverence for established lineage. Buddhism also became much Japanized by the appearance of such monks as Saicho of the Tendai and Kobo Daishi of the Shingon Sect.

Economic Condition The cleavage between the common people and ruling classes became more marked and the

Digitized by Google

clan or family ties weakened as the connection between demand and supply became more complicated. From this arose the necessity for exchanges and markets. Waka of the Mannyoshu suggest the existence of markets in Japan at such an early date. As a matter of fact there had been several markets opened in bygone times such as those of Tsubaki, Atokuwa and Éka. On the beach of Takahama in Hitachi (present Ibaraki) and by the straits of Asakumi in Izumo province (present Shimané) there were primitive markets opened for the people. These markets were first started in connection with Shinto festivals. In the Nara Age, there were the East and West Markets in the city of Nara, where trees were planted for giving shade, and from there pedlars travelled around as far as Échizen province (present Fukui).

In the 7th century silver and copper money was already in considerable circulation. In the 8th century copper money was cast by the Imperial Government, although it is not clear whether all the money in circulation before that was of Chinese origin or not. In the first year of the Wado Era, 708 A.D., silver and copper coins named Wadokaiho were cast at the Imperial mint, and this coining of metals continued, ushering in the period of money instead of barter.

In the Héian Age public markets were opened in the east and the west of Heian city. The East Market consisted of 51 shops and the West Market of 33, and they continued till the time of the Gen-péi (Genji and Héishi) wars in the 12th century. The largest among the local markets were at Tsubaki, Tatsu, Asuka and Ausa in Yamato province (present Nara) Shikama in Harima (near Himéji), Naniwa (Osaka) in Séttsu and Kowaki in Shiga. There were many trading ports, and of these Hakata, Muko and Naniwa were the most thriving in foreign trade, Hakata coming first, located as it was at the northern end of Kyushu, nearest to Korea and China. Foreign commerce at this time was mostly governmental, private trading not being allowed.

Social Classes (the 7th–12th centuries) The highest class of this age consisted of the descendants of the nobles of the preceding age; new dignitaries promoted for meritorious services; descendants of the Imperial House; and high priests of Buddhist temples. These people monopolized the highest positions in the government and administration. Wealth was naturally accumulated by them and civilized life attained by the assimilation of continental culture was theirs. The high official positions and ranks were accompanied with material estates and income, and nobility and wealth were synonymous. Living in the capital or vicinity and holding a close connection with the Imperial House this class enjoyed its aristocratic life until power was taken from it by the Fujiwaras in the 11th century.

Next came the class of provincial lords, or officials, scholars, warriors and certain naturalized Koreans or Chinese who were well educated. This class can be compared with the middle class of to-day. The power of the members of this class in politics was secondary, but the standard of their culture was as high as the first, if not higher, especially in the case of scholars such as doctors, astronomers, and mathematicians. They were the military and civil administrators in the local districts and the carriers of a higher civilization.

The third class of this age consisted of the descendants of the second and third classes of the preceding age, they were mostly engaged in agricultural work, although there were among them some artisans and merchants but the number was comparatively small. In fact handicraft and merchandizing was, in later days, mostly carried out by farmers as a kind of side line. They were compelled to work so hard in order to support the upper classes that some scholars of the economic history of Japan have called this "an age of slave economy." The people of this class were rarely given positions in the government, although they had access to the priestly positions in temples. Able youths emancipated themselves from serfdom by becoming outlaws and, as mentioned above, finally gave origin to the rise of the samurai class in the latter half of the Heian Age. In the 8th century this class constituted over 70 per cent of the entire population of Japan.

The lowest class of people, practically a slave class, consisted of two kinds of people. The first were the workers for the Court, the clothes, paper and furniture makers, musicians, stable-men, etc. They were mostly naturalized Koreans, and because of their tribal origin were despised by the other classes. Part of them seem to have been the forefathers of the "Eta" class of the Yédo Age. But they must have already belonged to the lower class in their native land, Korea, or may have been captives there, because there were many naturalized Koreans who occupied

Digitized by Google

honourable positions in the Imperial Court and in the second class mentioned above. According to a record of this age there were but 4,216 households almost all of which were in the Kyoto, Nara and Osaka districts. So far as the national law is concerned these slaves were freed several times, in 722, 744, and 759 A.D., but as a social class they remained the same.

The descendants of the "Yakko" of the preceding periods formed the second division of this slave class. Their social standard as such was legalized by the laws issued at the time of the Taika Reformation. The Taiho laws prohibited intermarriage between members of this "disgraceful" class and members of the "good" classes. Slaves who belonged to offices mainly worked as tomb keepers, farm workers and miscellaneous jobbers, while those owned by private houses did the dirtiest work. The number of these slaves comprised 10 per cent of the entire population. The average value of a slave in the Nara Age was 1,000 bundles of rice for a man and 800 bundles for a woman which meant the amount of rice which would feed a person for 2,500 days. This was rather a prohibitive price for the purchase of slaves, probably due to the small supply of slaves against the demand, the treatment of them by their masters was, therefore, very humane. In the Héian Age, the slave system underwent a gradual change, there was laxity in the imposition of the old laws pertaining to the system, and intermarriage with the "good" people often occurred. On the other hand, many of the third class people or oppressed farmers had become reduced to serfdom, and their intermingling with this class made the two classes indistinguishable at the latter half of the Héian Age.

Kamakura Age
(1192-1337 A.D.)

Samurai Government Samurai government continued for 685 years, from the time of Yoritomo Minamoto to the end of the Tokugawa Shogunate. During the feudal age the Minamoto, Ashikaga and Tokugawa families appeared successively as the heads of this Samurai government, holding all power, both political and military, in their hands. At the Imperial Court were the august officials, but its rulership was only nominal, and the real sovereign power was kept by the Shogunate.

In the middle of the Héian Age, the Fujiwaras grasped despotic authority in politics, and the rule of the Imperial Court sank into formalism. Imperial officials and nobles indulged in an effeminate life, discarding militarism. Vicious customs prevailed, misunderstandings arose between the Central Government and district offices and the gap between the rich and the poor became greater, gangs of robbers terrorized the people, civil wars great and small constantly occurred, and the people could not live in peace. This state of things gave opportunity for the rise of the warrior class, and the military government under the leadership of Yoritomo Minamoto was welcomed by the people as suitable for the troublous times, and the Shogunate came into being on its own merits.

The Kamakura Shogunate Yoritomo adopted Oyé's counsel, and asking the permission of Goshirakawa, the ex-Emperor who had the real power at the Court, stationed his warriors in different parts of the country as governors and deputies. He gave these governors military and police authority and to the deputies he assigned the administration of land and tax affairs, in 1185. All the political power fell into Yoritomo's hands as a natural consequence, and the military and political offices which were established at Kamakura became Shogunate head offices; in 1192, he was asked by the Kyoto Government to become Séii-Tai-Shogun or Generalissimo, and this meant the public recognition of the Shogunate authority.

After becoming Shogun by Imperial Order, Yoritomo Minamoto took great care to control the warrior-lords. He himself lived a very simple life and issued orders to the lords and warriors to do the same, thereby setting good examples to the people. His teachings did not primarily stress skill in fighting or the use of weapons but rather the moral precepts which must underlie the true warrior's way. The hitherto neglected and disorderly rural districts were taken care of and became closely united with the Kamakura Government, their agricultural and commercial life was improved, and the heavy taxation formerly levied by extravagant nobles was reduced to make the peasants' lives easier.

Foundation of Bushido Yoritomo was a pious man, revered both Shintoism and Buddhism, and was loyal to the Emperor. Bushido was indeed established by his teachings and practical examples. He encouraged the propagation of the Zen teachings which emphasized an ascetic life, and those of the Jodo Sect which taught man to realize his sinfulness. The principles of Bushido, however, had mainly to do with the

Digitized by Google

lord-and-subject relation among the samurai, and had defects as a common morality for the masses. But it is noticeable here that polygamy among the nobles of former days was gradually discarded and monogamy began to gain ground in this age, probably in consequence of the recognition of personality and the unusual emphasis on the fidelity of a lady to her lord in the Bushido code. Ideas of honour became strong; loyalty to the Emperor, patriotism, and belief in Japan as being the country specially favoured of the gods became established national ideals; Buddhism was completely Japanized; and the general moral standard was considerably raised.

Yoritomo's lineal descendants did not continue to hold power beyond the third generation, but the nearly related Hojo family took their place and ruled the people with ability till Takatoki Hojo was overthrown by the faithful adherents of the Emperor Godaigo in 1333. The Kamakura Shogunate was the real Central Government of Japan for over 140 years.

Education Education progressed also in the sense that it spread to local districts and especially among the samurai class. The Térakoya (see Chapter XXVIII) schools were started in the Buddhist temples of this age. Text books suitable for the education of samurai boys were compiled. At the time of the Ashikagas famous centres of learning were established at Ashikaga and Kanazawa (see Chapter XXVIII) near the present Tokyo. The Ashikaga Gakko (Ashikaga School) was first established by Yoshikané Ashikaga, a cousin of Yoritomo Minamoto, and has been continued for seven hundred years up to the present day. The Kanazawa Bunko (Kanazawa Library) was first established in 1275 by Sanétoki Hojo, great-grandson of Tokimasa Hojo the Shogun. Women's education was not neglected and sewing, housekeeping, penmanship and reading and composition of prose and poetry were taught to the daughters of well-to-do people.

Art and Literature The rise of individualism gave a new turn to the cultural life of the people. The break of tradition was discernible in fine art and literature. This was the age of Sung and Yuan in China and their literature and arts, flooding Japan, laid the foundations of modern literature and fine arts which developed after the Muromachi period. Picture rolls of famous battles and illustrated histories of shrines and temples were produced, reflecting the taste of the day. That portrait-painting first began during this age may be taken as a recognition of the individual value of men. (See Chapter XXXV.)

Commerce and Industry Before the Kamakura Age, agriculture was almost the sole industry of the people, although pottery, clothing, etc. were produced in government factories on a limited scale. The spread of culture among the local population in this age, however, quickened the progress of commerce and industry in country places and local centres. Hand-work and carpentry were emancipated from the protection of the nobles and temples, primitive guilds were created and classes of artisans of armaments, porcelain, lacquer-work, etc. came into existence. Seven guilds were established, of silk workers, charcoal burners, rice merchants, furniture makers, miscellaneous industrials, paper manufacturers and makers of ornamental things and cattle dealers.

Joéi Judicial Code In the first year of Joéi, 1232, a judicial code was issued. It was called Joéi Shikimoku (Joéi Judicial Code) compiled by Yasutoki Hojo and his colleagues. This was a compilation founded on the judicial customs of olden days and had no incongruities with the Japanese common life as was often the case with the laws issued by the Central Government at Heian, largely imitations as they were of Chinese laws. It proved, as a matter of fact, to be more practical and effective, and survived many other laws, as an authoritative code for the samurai class, to the time of the Meiji Restoration.

Muromachi Age
(1338–1602 A.D.)

The Muromachi Shogunate Shortly after the downfall of the Kamakura Government, Takauji Ashikaga established a Shogunate in Kyoto, wholly on his own accord, in 1338, and in the time of his grandson Yoshimitsu his work was completed. It was called the Muromachi Shogunate, after the name of the street in Kyoto in which the government had its headquarters. Its system and institutions were almost the same as those of the former Kamakura Government. A relative of Ashikaga governed eastern Japan, staying at Kamakura. This Kamakura governor was first a simple representative of the Muromachi Shogunate, but by and by he began to stand in rivalry against it. Governors were sent to other places and generals were placed at the head of

Digitized by Google

different military bodies. The governors in local districts were real lords, and acted freely on their own caprices.

Korea, China and Japan The official exchange of delegates with foreign countries was, as already mentioned, abolished, but nevertheless private trade continued. The Sung Dynasty united China in 979, and called forth a thriving international commerce. Merchants and Buddhist monks made visits to China much oftener than before. Kiyomori Taira opened a port at Hyogo and interviewed Chinese merchants at his palace. In the Kamakura Age, the Buddhist Zen Sect was introduced from China, and the Hojo built huge temples for its monks.

The Yuan Invasion. In 1206 the Yuan Dynasty gained sovereignty over the greater part of China and extended its territory even to a part of Europe. The great Emperor Kublai Khan took Korea, and destroyed the Sung Dynasty, winning possession of all China in 1279. He sent a messenger with advice to Japan to become his tributary, under threat of war. But Tokimuné Hojo, then in power at the Kamakura Shogunate, uniting forces with the Kyoto Court, firmly rejected the proposal. The result was a crisis for Japan in 1274 and again in 1281. The Yuan ruler in alliance with the government of Korea sent a great army to invade Japan. The Japanese were hard pressed, but they fought bravely with their small forces, and by the help of a typhoon which destroyed the enemy fleet they won the day in the summer of the year 1281.

The trade between the two nations, however, did not cease with the war. Takauji Ashikaga wished to build the Tenryuji temple and to get funds for the purpose he constructed trade boats which were called Tenryuji boats.

Trade with the Mings. From the beginning of the Kamakura Age, Japanese pirates had plundered the coasts of China and Korea. In the Muromachi Age, the Shogun Yoshimitsu Ashikaga concluded a friendly treaty with the Emperor of Ming in 1401. At the time of Yoshinori delegates of the Shogunate went to Ningpo with passports given by Ming authorities and traded there with the Chinese merchants. Not only Government delegates, but also the governors of local districts, monks and priests of temples or shrines, and some merchants of Hyogo and other ports sailed in and out with a similar purpose. The trade with Ming brought a great profit to Japan, and the Shogunate was relieved of its economic hardships, the western ports throve and the people became wealthy. The Shogunate did its best to prohibit the ravages of pirates, to prove its friendliness to the Ming Dynasty, but at the end of the Muromachi Age when the Shogunate lost its power and the local lords did as they liked, Japanese pirates again pillaged Chinese coasts, which were for a long time troubled with them.

Relations with Korea. At the time of the rise of the Mongolian nation, Korea turned against Japan under pressure of the Mongols. But the Japanese pirates ravaged her coasts, and she asked the help of China to send a strong protest to the Japanese Government. A general of Korea, Li-Seikei, was successful in protecting the nation from the attacks of the Japanese pirates, and he finally established a new dynasty of his own and called the new country Chosen in 1392.

Among the provincial lords there were many who had intercourse with Korea. Tsushima Island, especially, had close relations with her because of the nearness of its location. Its lord, So, opened trade with Korea in 1368. When Korea became known as Chosen these relations became even more intimate. There were many Tsushima islanders who became residents of Korea. (As to Japan's relations with the Western nations since 1543 when the Portuguese first came to Japan, see pp. 77–87 of the Japan Year Book, 1933, and Chapter VI of this volume.)

Feudalism It was during this age that feudalism was established as a definite system, and many of the provinces were ruled over by war-lords. Warriors fought each other, farmers were awakened to the need of uniting to protect their interests, and temples quarrelled with one another over the delimitation of their spheres of influence. It was a "dark age" in one sense, but important as an age of social change and progress. The advance of foreign trade was remarkable, and Japanese emigrants settled down in the South Sea Islands.

The war-lords began to disregard the orders of the Shogunate, becoming selfish and money-loving. Yoshimitsu Ashikaga, the third of the line, reorganized the Shogunate and restored its power for a while, but after his death it began to decay and the local lords usurped its authority. Both in the capital of Heian and in the districts civil wars raged year after year. The luxurious living initiated by Yoshimitsu and Yoshimasa, the 8th Shogun, spread like an epidemic among the local lords and warriors, and the ones who suffered

Digitized by Google

most were the common people, the farmers and merchants, because the expenses of the luxury of the upper classes came always from their pockets.

The latter half of the Muromachi Shogunate was an age of civil strife among the feudal lords. All tradition and authority disappeared, and any talented man, favoured by fate, had the chance to make himself a lord.

Military and General Education. Progress in military arts and the use of weapons was a feature of the age. Various styles of Kendo (fencing) were founded and schools to teach the art flourished in the four corners of the islands. Nor was general education neglected. Both the Ashikaga Gakko and Kanazawa Bunko fulfilled their functions as educational centres, Térakoya were established in more districts and education began to reach the farmers and merchants. In 1561 St. Francis Xavier landed at Kagoshima, at the southern end of Kyushu, and the Catholic faith was first preached among the Japanese. Otomo and other lords in Kyushu were baptized and within less than 30 years there were 200 churches built and over 1,500,000 people converted. Nobunaga Oda was in favour of Christianity from his policy of suppressing the unruly power of the Buddhist monks. Catholics were also eager to establish schools. Within the feud of Otomo there was established a seminary (Casa Professa) for training preachers. Colleges for young laymen were established at Arima in Higo province (present Kumamoto), Kyushu, Funai in Bungo province (present Oita), Kyushu, and Azuchi in Omi province near Kyoto. The last one was opened in 1581, and 25 boys from good families were instructed in the catechism, Latin, Portuguese, Japanese reading and composition.

Woman's Position Here it must be mentioned that the status of women was greatly lowered in this age of warlords and samurai. Men vaunted their physical prowess in battle, while women were compelled to live secluded lives, sheltering at home from the dangers of the times. Chinese dicta concerning the "three obediences and seven reasons for divorce" making of woman little better than a slave or chattel, suited the selfish convenience of man, and the Buddhist idea of woman as an impure being detrimental to man's ascent to Buddhahood, all worked together to pull woman's social position down to a ridiculously low level, contrasting with the high status she had enjoyed in more ancient days.

Commerce Ravaged by frequent warfare, the city of Heian or Kyoto had become deserted, the population thronging to the villages which nestled around the castles of the feudal lords. These in time became thriving cities or towns. Among sea ports Hakata, Hyogo, Muro, and Sakai were representative ones. To Sakai, for instance, came foreign ships direct, and there arose many wealthy merchants who had financial power over the Muromachi Shogunate. It was a free city, governed by its own city assembly and protected by its own city guard. Yukinaga Konishi who was first a pharmacist and became a lord on his own account, Sen-no-Rikyu, the famous specialist in the tea ceremony, and Sukémon Noya, a millionaire merchant in foreign trade with the South Sea Islands, were representative men of Sakai.

Industry The taste of the age was rather simple and purely Japanese. The war-lords found recreation in the tea ceremony or garden-making. The preservation of natural simplicity was the dominant note in these gardens, rocks and pebbles being used in their construction. The national leader in this direction was Yoshimasa Ashikaga, the Shogun, famous exponent of the tea ceremony. This ceremony was never a mere drinking of tea but a formalized social meeting, at which guests were invited by the host to a simple and tasteful dinner which was called Kaiséki. Choice porcelain wares and other utensils were used in it and the guests were entertained not only by the repast but also by the exhibition of rare articles and scroll pictures. It became a fashion of the time and greatly stimulated and improved the art of making porcelain, lacquer and cast-iron wares and Kakémono paintings. These were exported to the continent for the first time in the history of Japan.

The last quarter of this age, called the Momoyama Period in art history, was represented by the gorgeous taste of Hidéyoshi Toyotomi who built the Momoyama Palace of silver and gold. The influence of the Western world definitely reached Japan with the coming of Catholic priests in this period. It affected not only the spiritual and mental life of the Japanese but also the field of architecture. When Nobunaga Oda built the Azuchi Castle, the first of its kind, in 1576, Catholic priests gave advice or directed the construction. The central building of the Japanese castle is called Tenshu-kaku. The word Tenshu means the Heavenly Lord or God of the Catholic Church, and the Tenshu-kaku signifies the Tower of the Heaven-

Digitized by Google

ly Lord. It is said that in the Tower of the Heavenly Lord Catholic images were enshrined when it was first built. According to an art investigation, there are in Italy remnants of old buildings which resemble the Japanese castles and the influence of Roman architecture through the Portuguese and Spaniards must have been felt in Japanese castle building.

Economic Conditions There were economic reasons underlying the civil wars among the feudal lords in the latter half of the Muromachi Age. Enlarged volume of production, progress of communications and transportation, advancement of commerce and industry and changes in military strategy following the introduction of guns led to the wars of territorial invasion and expansion among the lords who had to provide for an increasing number of soldiers and officials. Both commerce and industry had from the time of Yoritomo Minamoto, progressed slowly but steadily with the spread of civilization to local centres, and merchants and artisans were gaining standing as a class. Up to the middle of the Muromachi Age the guilds called "Za" monopolized the supply of goods to the lords; this system, however, came to an end with the progress of free trading, and public markets were permanently established. The appearance of large towns and cities necessitated the accumulation of commodities and provisions from adjacent country places and other parts of the land and hastened the growth of wholesale dealers. The wholesale dealers of the age were called "Mommaru" and combined the businesses of innkeeping, wholesale trading, transportation and money exchanging. Banking business also made considerable progress. There were no banks in the modern sense, but the pawnshops were the banks of the day when as yet there was no regular credit system. Buddhist temples and the brewers of saké acted also as money lenders and they together with the pawnshops were usurers and capitalists. Tanomoshi-ko (small associations for mutual financial aid) were already in vogue. Accumulation of wealth became a dire necessity for the lords, but they had to rely wholly upon the farmers and merchants for financial support while the Central Government was too weak to aid them or protect their interests in accordance with the change of social and economic conditions. Some fell so heavily into debt that finally they had to surrender their territory to their creditors. The Shogunate prohibited the purchase or mortgage of land owned by the samurai to merchants and landed proprietors, but this regulation was not observed. By the end of the Kamakura Shogunate it had become too late to attempt the financial rescue of the samurai. The lords levied heavy taxes on their people and farmed out their collection to appointed merchants. The final outcome of this system, however, was to let the land fall into the hands of those agents, so that the lords were driven in desperation to get new land by force. At times the farmers and smaller merchants resorted to violence to protect their rights and demand more merciful governance from their respective lords or the Shogunate. They often attacked the wealthy merchants, temples and pawnshops to get back goods they had pawned.

The latter half of the Muromachi Age witnessed Buddhist mob rioting and fighting. The Shin Sect (or Ikko Shu) founded by Shinran gained great numbers of followers from among the common people, and some uprisings of these religionists were in reality directed against the ruling class. For instance, the Ikko mob which started rioting in the districts of Kaga, Noto and Échigo provinces, fought against Masachika Togashi the lord of Kaga and killed him, while another in the district near the present-day Kobé and Osaka defeated the armies of Hosokawa their lord, the fight extending over several provinces from Sakai to Ishiyama in Omi province (present Shiga). Iyéyasu Tokugawa, then lord of Mikawa (present Shizuoka), fought with them in 1563, and to Nobunaga Oda also they were a constant source of trouble.

The social changes caused by the progress of trade and commerce during the Kamakura and Muromachi Ages and the consequent disorder among the ruling classes were not allowed to take their own course very long, for foreign relations, especially with Western countries, presented many international problems and the necessity of national unity became keenly felt. The introduction of fire-arms brought about a fundamental change in methods of fighting. Arrows were no match for bullets. Preparations for war had to be made on a much larger scale and the warriors or soldiers reorganized in a more systematic way, and consequently the smaller lords were forced to unite under the leadership of greater ones who possessed real power and means to organize new armies. In this manner the unity of all Japan was realized in three stages through three great war-lords, Nobunaga Oda, Hidéyoshi Toyotomi and Iyé-

Digitized by Google

yasu Tokugawa.

Nobunaga Oda The first, Nobunaga Oda, was an official under the lord Shiba, but soon becoming independent he subdued one after another many lesser lords with his soldiers armed with guns, and, in July, 1573, dethroned Yoshiaki Ashikaga the Shogun and demanded direct access to the Emperor Ogimachi. Nobunaga who had had long and bitter experience of the Buddhist mobs waged war against them and set fire to the Enryakuji temple on Mount Hiéi, one of the most powerful temples of the time, thus putting an end to Buddhist meddling in political affairs. He found another means of lessening the power of Buddhist temples by favouring the spread of the Christian faith. He gave all encouragement to its propagation and welcomed the inflow of Western learning and civilization. Nobunaga destroyed the barrier gates in districts which hindered free commercial intercourse and transportation and put an end to the monopolizing guilds and gave merchants opportunity for unrestricted trading. But in 1582 he was assassinated with his work yet incomplete, and it was left to Hidéyoshi to continue the task of uniting the nation.

Hidéyoshi Toyotomi Hidéyoshi Toyotomi, a farmer's son, and one of the trusted generals of Oda, succeeded in subduing even such great lords as Mori and Shimazu in the west and Daté and Hojo in the north and practically united the whole nation by force. In 1583 the whole land of Japan was surveyed to divide it into new rural districts. In 1586 Hidéyoshi fixed the costumes of the samurai according to their rank. In 1588 the common people were ordered to surrender their swords for casting a Daibutsu (great image of Buddha), the purpose of this order being to prevent the wearing of swords by any except the samurai. The law of 1591 strictly prohibited the shifting of hereditary business, and the four classes of samurai, farmers, artisans and merchants were firmly fixed.

To force obedience to the law Goningumi (Five Men's Bands) were compulsorily organized. All the people (samurai inclusive) were grouped by 5 or 10 families and each group not only took joint responsibility for the doings of all of its members but helped its members in civil life. This originated before Toyotomi's time, but the law issued in 1600 made it an established institution and played an important part in the following Tokugawa Age both politically and socially. Hidéyoshi planned an invasion of the Continent, Formosa, and the Philippines, but died in 1598 before realizing his dreams.

Before the absolute unity of Japan could be accomplished another great statesman was to take the work in hand.

Social Classes (12th-16th centuries) The Ōnin war (1467-1475) which was fought between the Muromachi (the Fujiwaras) Shogunate families in the city of Kyoto not only destroyed the Shogunate itself but also reduced the Capital to ashes. The Court and the Shogunate lost power at once and the whole country was thrown into commotion for a century by the wars of the military lords.

The wars entirely did away with old social customs and laws and gave opportunity for the rise of petty warriors and landed-farmers who, to this time, had been subjected to the aristocrats and war-lords. This was a time of great changes in the social order of Japan. After the Ōnin war members of the labouring classes were able to become lords through their own ability; farmers organized to oppose their lords; commercial cities like Sakai, Yamaguchi, and Osaka, appeared and became rich with the development of foreign trade; and villages, in many districts, began to govern themselves.

In consequence of the rise of new war-lords the aristocratic class of this age was of two kinds, the old nobles in the Court and the new war-lords. The Court nobles had become poor through the confiscation of parts of their estates in country districts by the Kamakura Shogunate. They were, nevertheless, still highly honoured because of their culture and attainments, all lines of study being handed down by them in hereditary succession, and high positions in the Court were held by them though they had no practical power in the administration of national affairs. The only sphere of influence left to the Court nobles was in religious circles, except in the Zen Sect which had most of its adherents among the samurai classes. The Fujiwaras, who succeeded the Minamotos in the Shogunate government, again confiscated more than one-half of the lands of Court nobles and finally stretched their wanton hands over the estates of the Imperial House and temples and shrines in the name of military taxes. In the Ōnin war, fought in the city of Kyoto, the mansions of the Court nobles were all destroyed or set on fire and the nobles themselves were compelled to desert the capital and seek protection among the wealthy families in the country districts or temples and shrines.

Digitized by Google

The war-lords in this age were sons of local governors in older ages, new governors placed in districts by the Kamakura and Fujiwara Shogunates, and big land-lords who ascended to war-lordship by hiring warriors for the protection of their estates in the political confusion of the time. The name "Daimyo" which represented the war-lords in later ages, especially in the Yédo Age, originated in the land-lords, and meant one who owned a large estate or villages. The war-lords, new and old, took advantage of the downfall of the Shogunate after the Ōnin war to consolidate their field of activity all over Japan. They fought each other to obtain supremacy.

The second class of people consisted of farmers, artisans and merchants. The war-lords and Daimyo in the provinces built castles around which artisans and merchants settled, the artisans and merchants increased in number and the castles gradually grew into towns and cities, while progress in foreign trade during the latter half of this age gave rise to such port cities as Sakai, Hakata and Yamaguchi. Artisans and merchants formed guilds as mentioned elsewhere and protected their rights and profits. Farmers who had been trodden under the foot of the ruling classes began to make demands upon their lords who could no longer control them by threats but had to handle them in a more honourable manner. The first record of a farmers' mob movement against their lords was that of the farmers in Kinki (Kyoto and Nara) districts which started in September, 1428. The mob demanded the so-called "Toku Séi", cancellation of debt or a permanent moratorium. Mobs which were united in the faith of Buddhism such as the Jodo or Hokké sects were well organized and had some permanency so that at one time they formed their own government. In the province of Yamashiro the farmers succeeded in organizing their own government and elected members by vote at the Byodoin temple at Uji, Kyoto, in February, 1486. This and other examples of a similar nature were not allowed to continue because of later changes in political affairs, but they laid foundations for the future development of towns and villages and the "Goningumi" as mentioned above.

The lowest class in this period consisted of sons of the same class in the preceding age. The difference was that the slaves of Court nobles or government offices became more despised than the slaves at private houses. The latter were handled by their lords in a much more humane way than in the preceding age. The former, on the contrary, became more disliked by the other people because of their Korean origin and their special work of butchers and skinners, for such work was extremely despised by Buddhism, which taught people not to kill any living thing, even lice, and taboo all flesh. They were called the "Éta," the meaning of which changed from the "butcher" to the "polluted", and lived in groups secluded from others.

Yédo Age
(1602-1867 A.D.)

In 1600 Iyéyasu Tokugawa gained a decisive victory at Sekigahara, near Gifu, and became the practical ruler of Japan. Except for a small portion allotted to the Imperial House and various religious bodies, over 90 per cent of the entire land was divided among the Tokugawas, their relatives, and favourite generals and lords. Thus the complete unity of the nation was realized by the dual master-and-subject relation between the lords and their people and the Shogun and his lords. This feudal system lasted over 260 years, being quite unparalleled in the history of the world. This was a success primarily for the Tokugawa Shogunate rather than the nation. It was due for one thing to the financial and military strength of the Tokugawa family, secondly to the clever method of administration, best suited to keep wayward war-lords in order, and thirdly to the halting of alien influences from overseas.

Iyéyasu located the seat of the Central Government at Yédo (Tokyo) and governed from there his 200 lords and generals. The financial basis of this Shogunate was superior to that of its predecessors. About 7,000,000 koku ("koku" in this case means the area of land which can produce one koku of rice) or nearly one-fourth of the national area of 30,560,000 koku, was owned by the Shogunate directly or indirectly. Besides, all the ports and places important for political and military purposes, the largest cities and the centres of industrial and commercial activities, and all the mines of any value were under the Shogunate's direct control. It also retained the right of casting coins.

Buké Hatto (Samurai Law) After giving the final blow to the Toyotomis in May, 1615, Iyéyasu Tokugawa ordered the drafting of the law concerning the daimyo (feudal lords) and samurai. In July of the same year the Samurai Law was pronounced before the gathering of the daimyo called for the purpose

Digitized by Google

by the second Tokugawa Shogun, Hidétada. It consisted of 13 articles the gist of them being as follows: (1) Samurai must be well educated in general learning and versed in the arts of war; (2) Unbridled drinking and luxuriousness are strictly prohibited; (3) Criminals must not be aided or concealed; (4) All treasonous bodies and murderers should be banished; (5) No person other than the subjects of the daimyo should be allowed to live in his territory; (6) All repairs to castles need permission of the Shogunate and the building of a new castle is strictly prohibited; (7) If anyone detects a new castle building or a secret political organization in a neighbouring province he must report it to the Shogunate; (8) Marriages must not be celebrated privately; (9) All the lords are required to observe "sankinkotai". (According to this article the lords were divided into two groups, and each group was to come up to Yédo, the seat of the Shogunate, in April every other year, to stay there for one year and the Shogunate prepared their Yedo residences where their families were kept as hostages. These rules were somewhat loosened in later years.) (10) Styles of costume should be regulated according to rank and social position; (11) Servants ought not freely to use the palanquin (the only vehicle in those days) in travel; (12) Samurai should be instructed to live frugally; and (13) the lords should use discretion in appointment of officials. The purpose of this law was to restrict the armament of the lords, to suppress political organization and treason, to effectively inspect the local government of the lords, and to force them to keep order by strict rules on their behaviour. The number of daimyo was 157 according to the Shogunate statistics of 1614.

Kugé Hatto (Court Nobles Law) This law for the court nobles was promulgated in July, 1615, at the assembly of 150 court nobles at the Nijo Castle, Kyoto. It consisted of 17 articles, and included regulations regarding the positions of the Emperor, Imperial Princes and Princesses, the appointment of a Regency and chief councillor, adoption, court ranks, institution of the year name, costumes, the order of promotion, orders issued by magistrates, sentences of the court, and the position, ranks, costumes and honorary titles of the head priests of Buddhist temples. (See p. 100, the Japan Year Book 1936, for the main points of the law.)

System of Control Iyéyasu took scrupulous care not to give any chance to the Imperial House and the greater lords to gather forces against the Shogunate. His first policy was to restrict their powers by the promulgation of the Kugé Hatto and Buké Hatto above mentioned. His second was to allot their districts to the respective lords by an administrative plan deliberately schemed out. The Kanto district in which the seat of the Shogunate was located was put under the direct rule of the Shogun and ruled by his personal generals to protect the Central Government from attack. In the districts around Kyoto, the city of the Imperial House, none of the Tozama Daimyo, the conquered lords, were placed, but only the relatives of the Tokugawa and the Fudai Daimyo, lords who had been on the Tokugawa's side from of old; and in Kyoto itself a representative office of the Shogunate had the responsibility of watching any political move in that city. Along the two main roads, the Tokaido and Nakasendo (or Koshukaido) which connected Kyoto and Yédo, the Fudai Daimyo only were appointed to rule. The Tozama Daimyo were all given lands in the remoter parts and between each two of them a Fudai Daimyo was placed to play the part of a barrier. Such important places as Osaka, Sakai, Fushimi, Nagasaki and Ujiyamada were administered by governors directly sent from Yédo. The children of Iyéyasu were given large feuds and established the Houses of Mito, Owari, Échizen and Kishu, forming a defensive semicircular line. As a whole. Iyéyasu cleverly divided the land among the lords so as to keep the balance between the east and the west, a policy which proved successful till the balance was broken in the first half of the 19th century when the western lords rose in rebellion. The Shogunate paid scrupulous attention to all travellers along the Tokaido. It put a barrier at Hakoné, and nobody was allowed to pass through the gate without a passport issued from the lords or the Shogunate. After the enforcement of the articles of the Buké Hatto requiring the family of a lord to stay at Yédo, women were almost entirely prohibited from leaving the city for they must get Hakoné passports directly from the Shogunate.

The purpose of the seclusion policy adopted by the Tokugawa Shogunate was to shut out any possible outside political influence and to prevent the local lords from getting large profits out of foreign trade, and rising thereby to financial and political power. The Shogunate did everything to safeguard its supremacy and make the lords obedient, no matter how national progress

Digitized by Google

was hindered or into what miserable condition the people might be thrown.

Organization of the Tokugawa Shogunate The Shogunate was a government of one despotic ruler: the Shogun. No one man, however, can perform all the duties of a government unassisted. Although there were many changes in the organization and the names of offices in the 268 years of its rule the Yédo Government, in the main, had a Cabinet which consisted of one Tairo (the great elder), five Roju (the middle elders), and five Wakadoshiyori (the younger elders). The Tairo was the premier but, though the Shogun at times placed his most reliable and able statesman in the position, the years in which a Tairo held office were but few, the Shogun himself generally undertaking the office. The Roju were the ministers of the administration. They signed the public ordinances and documents of the highest import. Their administration was based on former customs and newly issued laws, while their secretaries had the responsibility of examining old customs and precedents to help their decisions. These five saw to matters concerning the Imperial House, the court nobles and prince monks, and controlled all the lords and high officials, local governors and inspectors, and in wartime commanded the armies of the lords.

The Wakadoshiyori consisted of four or five members who were at once councillors and vice-ministers and controlled the Hatamoto (the generals who directly belonged to the Shogunate), and the lower officials, and in any emergency commanded the armies of the Hatamoto.

Both the Roju and the Wakadoshiyori were appointed from among the Fudai-Daimyo only.

Under the cabinet there were three Bugyo, the Jisha Bugyo (Temple and Shrine Department), the Machi Bugyo (City Department), and the Kanjo Bugyo (Counting Department). The Jisha Bugyo controlled all the temples and shrines in the country and administered justice in the remoter districts. The Machi Bugyo administered the city (Yédo) affairs from administrative business to justice, police and prisons. The Kanjo Bugyo took charge of the treasury of the Shogunate, gathering taxes from the estates directly belonging to the Shogun.

The Roju, the Wakadoshiyori and the three Bugyo formed the Central Shogunate Government, all other officials belonging to or coming under the control of one or other of these. Among the local officials the most important were the Shoshi-dai who represented the Shogunate at Kyoto, the Osaka-jodai who represented the Shogunate at Osaka, the Fushimi Bugyo, overseers of the barriers at Kyoto, the Kobusho Bugyo or military department, and the Nagasaki Bugyo who controlled the lords in Kyushu.

Cultural Life Culture and civilization made greatest progress in the western part of Japan and it was in Osaka and Kyoto that literature and a more refined life developed in the earlier years of the Yédo period. Iyéyasu was anxious to spread knowledge and encouraged the study of the Japanese and Chinese literatures of former days; scholars of great learning appeared who opened schools and published commentaries or interpretations either of their own accord or by the backing or order of the lords. The progress of the art of printing greatly helped the spread of education by books. But in the early days of the age most of the energy of the ruling class and the common people was spent in readjusting their political and social life to the new state of affairs created by the united and centralized government of the Tokugawa Shogunate, and time was needed for the psychological atmosphere of the people to settle down toward a peaceful enjoyment of life in this better organized society.

It was not until after half a century that a characteristic taste and way of life began to show themselves, discarding the old garbs of tradition. Here it must be noted that the fundamental feature of the literature of the age was that it was the creation of the common people, people who were denied all opportunity of rising to higher social positions or assuming official posts in the government. The so-called Genroku period commenced with the luxurious life of the fifth Shogun, Tsunayoshi, who was a man of enthusiasm, fond of learning, and encouraged lectures and schools. Even before his time the general trend of the period had been toward extravagance and amusement following a century of peace. The Shogun's example, however, quickened and intensified this tendency, and such amusements as "nō" drama, joruri (or gidaiyu), and kabuki (see Chapter XXXVII) were enjoyed by the general masses, while pure literature such as haiku, waka, novels, and stories began also to be written and read among the lower classes. Skill in the fine arts, characteristic Japanese hand-work and special weaving arts reached the highest pitch.

In the Genroku period literary men were able to publish their writings free-

Digitized by Google

ly and the joruri of Chikamatsu, the novels of Saikaku, and the short poems of Bashō had a great circulation, most of their works becoming literary treasures of Japan for ages to come.

The leadership in civilization was still with Osaka and Kyoto up to the end of this period. But the Sankin-kotai and the power of Yédo, the seat of the Shogunate, did not long allow the centre of culture and fashion to remain in these old western cities, and Yédo had finally assumed the first position in all matters of political and social life by the last quarter of the 18th century. The following 80 years, especially the first 50 years of it, was the golden age of the cultural life before the Meiji Restoration.

The policy of the Tokugawa Shogunate in handling the people from the lowest to the highest, was very severe, and the class most oppressed being the common populace. Social tragedies amply reflect themselves in the literature of joruri writers, Chikamatsu and his contemporaries, and in spite of the apparently good intentions of the Shogunate rulers and advisers to improve the political, economic and social conditions, in many cases the people in general were either trodden down by lawless samurai or entangled and rendered helpless in the network of prohibitive laws.

But the characteristic optimism of the Japanese kept them from falling into hopeless discouragement and their surplus time and money were spent in amusements of all kinds. This repressed energy found its outlet in creative industry and literature, or their enjoyment. Besides the standard works of literature there are preserved smaller illustrated pamphlets, short novels and poems which reflect the life of the common people in those days. They expose the looseness of the social life in many respects, but it is wonderful how they show the innate heart of the Japanese people, optimistic, realistic and humane. If it were not for its partial suppression by the Government this common literature might have attained remarkable progress. All Japanese amusements either originated or took definite form in this age. In the upper classes of society a similar course of development ran through all phases of life. Characteristic Japanese philosophy on human life or Shintoism was created by the combination of Chinese philosophies and Buddhism.

Gradual Economic Decline At the beginning of the Tokugawa Shogunate foreign trade was carried on to a considerable extent but afterwards it was almost entirely prohibited except to a small extent through one trade port, and all hope of increasing the national wealth and economic progress of Japan was lost for the time being. Even with its income from the large territory above mentioned the Shogunate could hardly manage to keep pace with the ever increasing expenditure. Financial unsoundness appeared at the time of the fourth Shogun, and from the fifth Shogun on they were forced to rely upon the profits gained by the recasting of coin. Various improvements and revisions of economic policy wrought no material change of situation for the better. In the Tempo Era (1830–1844), the Government stood on the brink of bankruptcy and during the last years of the Shogunate the financial situation went from bad to worse.

The local lords had territories of 10,000 koku to 1,020,000 koku each, but their income from these was too small to feed all their dependent samurai and soldiers, and to finance the Sankin-kotai travelling expenses. They fell into heavy debt, their creditors being the wealthy merchants and money lenders at Yédo and Osaka, the two business centres of the time. From the middle of the Yédo Age few of the lords could manage without the help of the rich merchants. Seventy per cent of the national wealth was said to have got into the hands of wealthy business men by the end of the age. In 1843 the lords sent about 4,000,000 koku of rice to Osaka, 3,000,000 koku of which went to Osaka merchants as interest on their debt of 60,000,000 ryo (gold coin). All means to which they resorted to increase their incomes proved in vain.

The samurai were also compelled by the Sankin-kotai system to have two houses, one at their rural town and the other in Yédo. They were not allowed to do any productive work but received a kind of salary from their own lords, and mostly lived a leisurely life, although some were given offices in the local governments. The long peace did not necessarily bring happiness to the samurai, but rather drew them into different means of pastime and their fighting spirit was dulled with the increasing tendency to luxury. Their incomes were limited from the beginning and were still more shortened by compulsory loans to their feudal lord out of their "fuchi" or salaries, or even complete suspension of payment. They had no way of extorting from the farmers, as the lords had, and after losing all their means they could not help

Digitized by Google

but break the law and work secretly for their living as artisans or small merchants. In the end the samurai began to sell their weapons and armour which had become useless in the long years of peace.

In the Yédo Age the country folk still lived on the natural products of their farms, helped out by some small income from their handwork, and each village constituted an economic unit, self-supplying and self-supporting. The political peace benefited farmers especially and increase of production resulted from the improvement of farming instruments and institutions. The kinds of vegetables grown became more numerous, sericulture advanced remarkably, and new areas of arable land were brought under cultivation. At the time of Toyotomi's land survey (1573) the rice production of the whole country had been estimated at 18,000,000 koku. In the Genroku Era (1688–1704) it increased to 25,780,000 koku, and, in 1842, to 30,550,000 koku. But 50% of the farmers' income had to be paid to the lords, they were forbidden to move from one place to another, or to change their occupation, purchase of land was restricted, the Gonin-gumi and other feudal institutions fettered them hand and foot. So this class of people was also thrown into miserable depression, and farmers resorted to such desperate measures as infanticide, fleeing to cities and mob riots to escape from their difficulties or fight for their living.

The number of recorded farmer-mob riots reached 568, including 68 in the early period of the age, 236 in the middle, and 264 in the last. The usual motive for rising in mobs was anger at the unreasonable extortion by the lords, tenant disputes being as yet rare.

It was estimated that the proportion of farmers to the whole population was 80%, and the total population in the Yédo Age showed a slow increase in the first half and a standstill in the latter. This was brought about by such natural causes as famines, prevalence of epidemics and insanitary dwellings; but the dreadful habit of infanticide which originated from the direst difficulty of living among the farming class, must have been the greatest factor in checking the increase of population, for it was usual among farmers to restrict the number of their children to less than three in a family. Another negative measure was to flee from the territory of the despotic lord to large cities. Cities had insufficient capacity to receive the inflow of these country people because as yet there were no industrial factories, but there were many openings for house-workers, day labourers and apprentices in the business houses or artisans' shops.

Commerce and Industry The advance of commerce was helped by the increase of population in the towns and cities where central and rural governmental seats were located and the regular journeys to and from Yédo of the lords and their soldiers in Sankin-kotai. But as all foreign trade was banned, business could not take on any natural or international development. The main commodity of the day was rice, that produced in the Kansai, Chugoku (the Main Island west of Kobé), Shikoku, Kyushu and Hokuriku (districts facing the Japan Sea in the central part of the Main Island) being transported to Osaka rice-dealers, while that of Kanto and Ohu or the north-eastern provinces was sold in Yédo. Exchange business in rice had already commenced among Osaka merchants and speculations began to draw common interest. Coins of gold, silver, bronze or copper were in good circulation by this time, although these suffered changes of value at times, and the west of Osaka adopted the silver standard while the east took the gold standard. Paper money was issued by the rural governments so that money economy prevailed all over Japan. Bank business or Ryo-gaé and the credit system made considerable progress.

Yédo had over a million population and Osaka came next with several hundred thousand. There were many other cities of over ten thousand. Seclusion had put a stop to sea transportation to foreign lands, but land transportation within the country made wonderful progress. The five highways, To-kaido, Nakasen-do, Koshu-kaido, Nikko-kaido and Oshu-kaido (Dō or Kaido means road) converged at Yédo and men and goods came to the Shogunate capital along them and their byroads from the remotest corners of the land. Coasting sea transportation had the following four main lines: the South Sea line between Yédo and Osaka, the West Sea line between Osaka and Nagasaki, the North Sea line from Shimonoséki to Matsumaé, and the East Sea line between Oshu and Yédo; the most important of these being the South Sea line which connected Yédo the greatest consuming city and Osaka the greatest commercial centre.

On the other hand factories were still undeveloped and most articles were made by hand in individual houses. Industry with large capital and in factories was limited to brewing at Nada, weav-

Digitized by Google

ing at Ashikaga, Kiriu near Yédo and Hakata in Kyushu, metal foundries in Chugoku and shipbuilding.

The seclusion policy quenched the enthusiasm of the Japanese for foreign trade which had been greatly stimulated at the time of Nobunaga Oda and at the beginning of the Yédo Age by the activities of the Goshuin-sen or registered vessels and small boats of the pirates. The Islanders were compelled to fall back on the old economic system of self-supply and self-sufficiency, and unwillingly relinquishing the international spirit that had aspired to things Western on a far larger scale than that of China centuries ago.

At the same time, however, it resulted in the creation of many industries and fine arts purely Japanese, and in the course of time, the work of the artisans became minutely specialized numbering over 150 kinds. The artisans were united in guilds according to their kinds, which protected their rights and profits, master, artisans and apprentices comprising each house. There were government purveyors who were protected by the Shogunate and accumulated wealth. The number of merchants greatly increased and the classes of the wholesale merchants, middle men and retailers were definitely established. The wholesale dealers organized associations and gradually, in their financial ascendancy, acquired real power over the samurai and lords.

Social Classes (16th–18th centuries) The policy of the Tokugawa Shogunate, which followed the national unity of Hidéyoshi Toyotomi, clearly marked the class divisions into five, the samurai or buké, farmers, businessmen, educationists and outcasts.

First, taking the place of the former Court nobles came the samurai class. This consisted of the war-lords or daimyo and their warriors and occupied governmental positions and was responsible for all the national political and military affairs, both central and provincial. The samurai lived on the revenue from taxes levied on the farmers and businessmen. In times of emergency unreasonable levies were imposed upon these working classes, and extremely despotic lords often robbed them of their wealth in the name of loans never repaid. This latter injustice was specially repeated by the lords at the end of the Yédo Age when the samurai class was thrown into an economic depression by reasons mentioned elsewhere. According to statistics taken by the Meiji Government in 1872 the number of samurai households was 395,825, with an aggregate membership of 1,911,239, or 7 per cent of the total population at the end of the Yédo Age. There were in 1752, the Shogunate House, its three relative lords, and 258 lords or daimyo. Among the 258 daimyo those who owned an estate above 600,000 koku numbered 3, above 200,000 koku 15, above 100,000 koku 27, above 60,000 koku 20, above 30,000 koku 62, and above 10,000 koku 23. All of these lords were made peers after 1884 when the old daimyo system was done away with by the Meiji Government.

Farmers were divided into three classes, village officials, landowners and tenants. The first of these were the largest landowners in villages who were asked by the daimyo or samurai dignitaries to levy taxes on the villagers. They represented their village and had power over the villagers in both public and private matters as tax-gatherers, police and leaders of the community. Other landed farmers who had no official responsibility owned their own land and farm and were the tax-bearers of the community. The tenants were subjects of the other landed farmers and were the most pitiable of the working classes of the time. Of their production 50 per cent went to the samurai as public taxes and 30 per cent to their master or landed farmers as rent, and they themselves were compelled to live on but 20 per cent of what they had produced. The percentage of these classes of farmer seems to have been 2.5 per cent, 37.5 per cent, and 60 per cent, respectively. Farmers were often stricken by natural calamities in addition to this squeeze by the ruling classes.

The class of businessmen was also divided into two, wealthier merchants or artisans who owned houses and lots, and tenants. In social standing businessmen were regarded lower than farmers, but as a matter of fact their economic condition was much better. Their prosperity depended on the luxury and consequent demands of the samurai class, so the samurai and businessmen were economically interdependent, but the businessmen gradually obtained the more powerful position and wealthier "chonin" or merchants became to be much honoured because of their economic power. Toward the latter half of the Yédo Age they actually became freer than the samurai. At times their wealth and lives were forfeit to the Shogunate or local warlords, yet they laid an unshakable foundation for the business classes in new Japan after the Meiji Restoration in 1868.

Digitized by Google

The educational class consisted of the Court nobles, monks, priests and physicians. The social standing of the Court nobles was still high. The Emperor was duly respected by the Shogunate and daimyo, but he had no political power. The Court nobles who lived in Kyoto with the Imperial House had but a meagre means of living. They were satisfied to be tutors in one art or another, such as waka, Japanese football, penmanship, astrology, medical science, etc. Yet their hereditary position as the nobility was well established and they formed so strong a class of their own that the Shogunate or the war-lords could hardly disregard their existence, in fact it was by the combined power of the Court nobles and the "rônin" or masterless samurai that the Shogunate was finally overthrown in the middle of the 19th century.

The lowest class in the Yédo Age, as in the preceding period, were the "Éta" and "hinin." The number of "Éta" or "polluted" remarkably increased in this age because war-lords in the previous war age called the butchers and skinners to their castle-towns to manufacture articles for war, and the birthrate of these "Éta" was great. They lived all over the country instead of only in the Kyoto and Nara districts as in the previous age, forming their own communities. They were despised by other people to the extent that they were not allowed to eat or sit with them. Intermarriage and mixed residence with other classes was strictly prohibited by law. This "Éta" class has been most unreasonably treated to the present, although the Meiji Government declared in 1871 that no legal distinction should exist between the "Éta" and others. The "hinin," outcasts, beggars, and the like were put in the same class with the "Éta". According to statistics taken by the Meiji Government in 1871 the number of the "Éta" was 280,311, beggars 23,420 and others 79,097.

Ronin A characteristic phenomenon of the Yédo Age was the appearance of the Ronin or masterless samurai. Such samurai had existed in previous years, but at the time of the despot Toyotomi their number was insignificant. The samurai who had followed lords defeated and ruined in battles became ronin, their number was added to by the extinction of noble houses in punishment for rebellion and the unemployment of the sons of samurai, other than the first born, who had no share in the inheritance of their father's property or position. Some samurai voluntarily chose the life of a ronin. All these lawless ronin lived from hand to mouth and were either at odds with the ruling class or gave constant trouble to the common people. The event mainly responsible for the creation of this class of people was the battle at Sékigahara (1600 A.D.) which decided the supremacy of the Tokugawas over the Toyotomis. In the 13 years between that battle and the Osaka battle which ended in the final destruction of the Toyotomi family, the number of the lords entirely ruined or partly deprived of territory reached over 100 and the confiscated area to approximately 9,000,000 koku. Some found second masters but the larger number of the samurai were thrown out of work. The Osaka battle was caused by these samurai in a last attempt to preserve the power of the Toyotomis, although it ended in their complete failure. Again, in the 23 years between the Osaka battle and the Shimabara Rebellion in 1637 another 70 lords lost the whole or a part of their territory by the relentless application of the Buké Hatto, and indeed the Shimabara Rebellion was nothing but an outburst of complaints by the Catholics and the ronin against the oppression of the Shogunate. But the power of the Shogunate was unshakable. The number of the ronin, however, was still more increased, and in the 4th year of the Kéian Era, 1651, Yui-no-Shosétsu and his colleagues attempted a change of the Shogunate government for the benefit of the ronin, although it was suppressed by the wholesale arrest of the ambitious leaders and the harakiri of Yui-no-Shosétsu himself on July 25 of that year. There were minor events caused by outbreaks of the ronin here and there and at last the Shogunate was awakened by these uprisings to the graveness of the situation and after the Kéian Era measures were taken to prevent further increase in the number of these masterless samurai. As a rule, in obedience to Bushido ethics, the samurai did not like to take a second master, and only a small portion found positions, while the rest either remained unemployed or chose some other occupation. Some became merchants or farmers. Others became scholars and opened Térakoya and educated the young in Confucianism and Japanese literature and morals. Still others became specialists in military arts and gave lectures to the samurai and the lords, while there were quite a number of experts in fencing and archery who opened drill-halls or schools in the larger cities. The better element of the ronin played an important part in the

Digitized by Google

social development of the country standing in a freer position than the regular samurai. And the last and most praiseworthy task they accomplished was to take a prominent part in the movement for aiding the Imperial House which finally led to the Meiji Restoration.

Exclusion Policy

Policy of Toyotomi The Catholic faith spread over Japan very quickly and many churches were built in various places. But the dogmas and institutions of the Church were in many ways unfitting to Japanese ideals and customs. Besides, the friars or missionaries were charged to have behaved without discretion, disregarding the laws of the nation. Hidéyoshi Toyotomi therefore destroyed the Catholic Church in Kyoto in 1585, and issued a Prohibition Law in 1587, forbidding the residence of missionaries at Nagasaki and other places. But he still allowed foreigners who did not mean to spread the religion to come.

A little later, when trade with Luzon was opened, Spanish missionaries came to Japan. These missionaries were antagonistic to the Jesuits and tried to preach another form of doctrine among the Japanese people in the face of the Prohibition Law, and quarrelled with the Portuguese missionaries. Hidéyoshi issued a more drastic prohibition law and severely punished the breakers; but he died without accomplishing his aim, and both Portuguese and Spanish missionaries came in greater numbers and preached the Gospel more earnestly so that the believers in it increased with remarkable rapidity.

Policy of Iyéyasu Iyéyasu followed in Hidéyoshi's steps and encouraged foreign trade. But being anxious lest the people should be misled by the Catholic priests he prohibited their preaching in 1612, expelled them from the country, and strictly ordered the Japanese believers to turn from their faith, and those who did not obey his order were condemned to death. They called this turning from or casting away the Christian faith "Korobi" or rolling over.

Going Abroad Prohibited But missionaries came in considerable numbers, and secretly continued to spread Christianity. The Shogunate saw the difficulty of complete prohibition, and began to take stricter steps. Iyémitsu, the third Shogun, prohibited the importation of foreign books in 1630, forbade any one to go out of the country without permission of the Government in 1633, and prohibited the going abroad of any Japanese in 1636. Finally, no Japanese was allowed to return from other countries. And thus the ambition of the Japanese for foreign expansion was quenched.

Seclusion of the Nation The Shogunate kept a strict watch against the coming in of the Catholic faith and tried to exterminate the believers in the country. Its measures were so severe that the Christian believers rose in rebellion at Shimabara in 1637. The uprising was subdued in a short time, but because of it the Shogunate determined to go a step farther in carrying out the law, and prohibited the coming of foreign people entirely in 1639, with the only exception of the Hollanders who helped the Shogun's armies in the fight against the religious mob at Shimabara and cherished no idea of spreading the Catholic faith among the Japanese. Hollanders were allowed to trade at Nagasaki, but only under supervision of the officials.

With this strict seclusion policy the Shogunate was able to root out Catholicism and remove from the minds of the people the influence of foreign thought and belief, and so gain peace in home affairs. But during those years, foreign affairs became known to only a few of the Shogunate upper officials, and this merely through meagre reports presented by the Dutch Consul. The people were kept in entire ignorance. The result of this isolation from the nations of the world was that the country dropped behind in world civilization.

But general movements among the nations of the world did not allow Japan to stay forever in a secluded condition. In the 18th century, foreign ships began to visit Japan, and the Islanders could no longer leave these intruders at their shores unheeded. The end of the Yédo Age was evidently drawing near.

Foreign Studies Renewed Seventy years after the enforcement of seclusion, books on foreign trade and the state of affairs in the Western world were published and the people were much instructed by such literature. The Shogun Yoshimuné took an interest in Western studies and followed a liberal policy for importing Western books in 1720, this brought about a Renaissance which awakened the Japanese from their long sleep.

Seclusion Law Reinforced The Seclusion Law required the provincial lords to drive foreigners away from the shores of the Empire, but its observance grew lax with the lapse of time. At the end of the 18th century the Shogunate made it milder and allowed foreign ships to come, on condition that

Digitized by Google

they had no enmity to the nation. Unfortunately, however, the repeated rough conduct of foreign sailors irritated the official mind and caused the reinforcement of the old law, the coastguards being given orders to bombard any foreign boat which came near the shore, to arrest any of the crew who landed, and kill them if necessary. At the same time, strict orders were given to Japanese boats not to have any intercourse with foreign vessels (1825).

National Doors Opened

An American ship, the "Morrison", coming to bring members of a Japanese shipwrecked crew back to their country, met with the bombardment, and went back to China in 1837.

In 1844, William II, King of Holland, sent a confidential letter with a special delegate to Japan, to warn that country to be careful not to follow the miserable example of China. Merchant vessels and warships of England and France many times came to the Loochoo Islands and the French made a forcible landing at Naha, the best port of the Loochoos, put missionaries ashore there and asked for the opening of friendly intercourse in 1844. The Shogunate complied with their request for trade, but drove the missionaries away in 1848.

Treaty of Amity with America In the sixth year of Kaéi, 1853 Commodore Perry came to Uraga with a fleet of four warships. A friendly treaty was finally concluded between Japan and America in 1855.

Treaty with Russia Russia also sent Vice-Admiral Poutiatine to Nagasaki in 1853, and a treaty of commerce with Russia was concluded by which Shimoda, Hakodaté and Nagasaki were opened to her vessels, and agreements were made respecting the boundaries of Russia and Japan in the north.

At that time England and Russia were at war, and in 1854 an English warship came to Nagasaki for a supply of provisions. The Shogunate consented to open Nagasaki and Hakodaté for English vessels, and an agreement was reached between the two nations. Hakodaté and Shimoda were opened to Holland also and a treaty was concluded in 1855.

Conclusion of Commercial Treaties In 1856 the United States sent to Shimoda her Consul-General, Townsend Harris, who finally succeeded in coming up to Yédo and got an interview with the Shogun Iyésada in 1857. He earnestly requested the Government's consent to open trade relations, and asked that an American minister might be stationed in Yédo, assuring his hearers of American sincerity. The foreign trade allowed hitherto by the Shogunate was only through the mediation of the officials, and Harris insisted upon free and direct commerce between the merchants of the nations.

The Shogunate officials themselves, already aware of the inconveniences of the old system, complied with his requests, regularly concluded a friendly commercial treaty with the United States, and agreed to open New Kanagawa (the present Yokohama), Nagasaki, Niigata, and Hyogo (Kobé) in addition to Shimoda and Hakodaté. They allowed Americans to settle in those ports for trade, gave them freedom to come in to Yédo and Osaka, recognized their freedom of religious belief and extraterritorial jurisdiction, and regulated the rate of tariff in 1858. This was the so-called Anséi modus vivendi.

In the same year the treaty was sanctioned by the Shogunate, without the Imperial sanction. The Shogunate concluded similar treaties with Holland, Russia, England, and France in the same year; and with Prussia, Switzerland and Belgium a little later.

Opening of the Country The Government appointed a commissioner to administer foreign affairs in 1858, and the Shogun earnestly requested the Imperial sanction for the provisional treaties, and finally got it in 1865. The carrying into practice of all these treaties was realized with the opening of Hyogo (Kobé) port in 1867, the year of the accession of the Emperor Meiji. In the meantime, several international troubles occurred. Russia tried to invade Tsushima in 1861, Satsuma warriors fought against an English fleet off Kagoshima in 1863, and the Nagato clan had an engagement with the combined fleets of France, England, Holland, and America at Shimonoséki in 1864.

Downfall of the Shogunate

Court and Shogunate The Yédo Government adopted the policy of keeping the Imperial Court at a respectful distance, paying apparent homage to it, but actually presenting it only with 120,000 koku of rice, the pension of a middle-class lord.

Uprising of the Loyalists On the other hand, the smouldering fire of loyalty to the Imperial House was gradually fanned into a blaze by the increasing attention paid to the study of Confucianism and old Japanese literature. Confucian scholars taught that the first duty of the people was to be loyal to the King (Emperor) and not to the Conqueror (Shogun), while the students of old

Digitized by Google

Japanese literature explained the irrationality of the Shogunate régime in the country of which the sovereingty belonged solely to the Imperial House. Down to the middle of the Yédo Age, however, these teachings did no harm to the Shogunate for both the ruling class and the people took them as mere matters of academic interest without practical application. Mitsukuni Tokugawa, the lord of Mito was among the foremost in advocating the virtue of loyalty to the Imperial House, himself beginning the work of compiling a Japanese history to make this characteristic Japanese virtue clearly understood, and erecting a monument to the loyalist Masashigé Kusunoki at Minatogawa, Kobé. Such other scholars as Ansai Yamazaki, Kéisai Asami, and Soko Yamaka, mostly praised the virtue of loyalty, though not necessarily to incite any anti-Shogunate sentiment. Their teachings, nevertheless, acted to stimulate Imperial loyalty in the hearts of the samurai and the people till the time came when it should burst into flame.

The first instance of these sentiments being transformed into practical action was the movement of Takénouchi Shikibu who came from Niigata to Kyoto and went about among the Court nobles insisting upon the need of a loyalists' uprising. He was banished by the Shogunate in 1759. Daini Yamagata and Umon Fujii followed him, but both were soon put to death. However, the corruption and weakening of the Shogunate régime quickened the anti-Shogunate feeling in general towards the end of the 18th century. Especially the renaissance of Japanese literature and national character brought about by the teachings of the Japanese scholars, Norinaga Motoori and Atsutané Hirata greatly helped the cause of the loyalist movement. Hikokuro Takayama went around the provinces propagating the principle; Kumpéi Gamo visited the tombs of the deceased Emperors and publicly bewailed their neglected state. Sanyo Rai wrote a Japanese history in which he praised the Imperial House and chastised the Shogunate with a keen and powerful pen.

The knocking at Japan's doors by foreign countries presented ample chances for the loyalists to take advantage of the confusion and misdoings of the Shogunate Government, and public opinion finally endorsed their movement at the beginning of the 19th century.

The Ansei Coup d'État When Koméi, father of Meiji the Great, came to the Throne, he did not hesitate to give Imperial suggestions and command to the Shogunate, and the Imperial power was greatly strengthened. The party which was defeated in its hopes for choosing another man for the 14th Shogun schemed a reformation of the Shogunate from within. They united with other forces and asked for an Imperial edict to accomplished their plans. The Emperor issued an edict and reprimanded the Shogunate for their rudeness in concluding treaties without the Imperial permission. Whereupon the Shogunate sent a delegate to apologize for the steps they had taken, but at the same time the Tairo (premier) Naosuké Ii declared the coup d'État of Anséi, 1858, and punished and put into prison all who worked for the issuance of the Imperial edict. His purpose was to re-establish the governmental authority of the Shogunate. But Ii was assassinated at the Sakurada gate of the Shogun's palace in 1860.

The assassination of the Tairo gave what was to prove a final blow to the Shogunate though the Roju, Nobumasa Ando, schemed a combination or amalgamation of the Imperial Court and the Shogunate to save the latter from ruin. Some of the powerful lords in the west responded to the idea for a time, but public opinion was overwhelmingly against this amalgamation movement on the part of the pro-Shogun party, and the anti-Yédo movement increased still more in power. Most of the loyalists gathered in Kyoto and hotly discussed the matter. The ronin or unemployed samurai flocked to the cause in such great numbers that it was necessary for the armies of the lords of Satsuma, Tosa and Choshu to keep them in bounds in order to preserve the peace of the city.

On the other hand, the Emperor Koméi sent a messenger to Yédo to urge the reformation of the Shogunate Government. The Shogun Iyéshigé tried to make improvements in the system of Sankin-kotai, etc., but it was too late to regain the support of the people. The Namamugi incident, in which three Englishmen were killed or injured by the lord of Shimazu's samurai and England demanding compensation, stirred the extreme anti-foreign party to fury and the Kyoto Court sent this time Sanétomi Sanjo to Yédo and ordered the Shogunate to wage war against all foreigners. In 1863 an Anti-Foreign Edict was issued by the Shogunate, and the armies of the Choshu and Satsuma lords attacked foreign merchant ships and warships. The fanatical Kyoto loyalists demanded that a nation-wide anti-foreign movement should be launch-

Digitized by Google

ed, and the Emperor was inclined to take command of the movement himself, but the more sagacious and saner-minded princes and lords advised him to realize the unwisdom of anti-foreign action, and the leaders of the radical element lost influence and fled to the west. For a while the schism among the loyalists persisted, but the object lesson of the bombardment of Shimonoséki by a combined foreign fleet weakened the anti-foreign movement to a great extent. By 1867, when the Emperor Meiji ascended the Throne, the anti-foreign movement had died away and the loyalists were solely concerned with the destruction of the Shogunate régime, recognizing the inability of the Shogunate to sustain the national honour in the crisis.

Prince Sanétomi Sanjo, one of the seven Court nobles who had fled to the west, joined Prince Tomomi Iwakura in leading the anti-Shogunate movement. The hostility between the two greatest of the western lords, Shimazu, lord of Satsuma province and Mori of Choshu or Nagato, was pacified by the arbitration of Prince Sanjo and they became strongly united in the common cause. Prince Iwakura, succeeding in making a definite plan for the destruction of the Shogunate, gathered many young and gifted samurai under these two lords, such as Takamori Saigo, Toshimichi Okubo of Satsuma and Takayoshi Kido of Nagato, and asked the Imperial sanction for the movement.

On October 14, 1867, the Emperor Meiji gave orders to the Satsuma and Choshu lords to open hostilities against the Yédo Government. On the side of the Shogunate, Toyonobu Yamanouchi, former lord of Tosa in Shikoku, was informed of this secret plan of the Imperial army, and being anxious to avert the impending civil war sent Shojiro Goto to present a memorial to the Shogun Yoshinobu (Kéiki) Tokugawa, advising his surrender of the sovereign authority. Whereupon Yoshinobu, who was staying at Kyoto, immediately called an assembly of the representative samurai of the lords then staying in the city to the Nijo Castle on October 13, 1867, and asked their opinion on his determination to surrender. The assembly gladly agreed to his decision on the advice of Shojiro Goto and Tatéaki Komatsu, a subject of the Satsuma lord. On October 14, Yoshinobu presented a written request for the Imperial permission, and on October 24 the resignation of the Shogun was formally tendered to the Throne. Thus the Yédo Shogunate ended with the 15th Shogun, after having continued for 265 years, and after a total period of 675 years the sovereign authority was restored to the Throne.

THE NEW JAPAN

Meiji Era
(1868–1912 A.D.)

The Meiji Restoration

In December of the same year, the Emperor Meiji issued an important order abolishing the old officialdom and forming a new Dajokan which should consist of the president, councillors and vice-councillors, and proclaiming the direct rule of the Throne in every line of national government. The Imperial Prince Arisugawa was appointed President of the Dajokan, and those court nobles and feudal lords who had faithfully worked for the restoration were given the position of councillors, while some other men of ability from among the nobles and common samurai were made vice-councillors. The people were allowed to live in complete equality, discarding the old castes of nobles and common people. This change was called "Ishin" or the renovation of all things. In the following year, 1868, or the first year of Meiji, the Emperor by the advice of Takayoshi (Koin) Kido, a vice-councillor, called together the princes and high officials to the Shishinden or central palace and took the famous oath of five articles before the ancestral gods. These five articles of the Imperial oath provided the foundation to the new régime. They were as follows: "(1) We will call councils and rule the nation according to public opinion; (2) Men of upper and lower classes without distinction shall be united in all enterprises; (3) Civil officials and military officers shall be in one accord and all the common people shall be so treated that they can attain their aims and feel no discontent; (4) Old unworthy ways and customs shall be destroyed and the people shall walk along the highway of heaven and earth; and (5) Knowledge shall be sought among the nations of the world and the Empire shall be led up to the zenith of prosperity. To accomplish this unprecedented reformation, We go before the people, and proclaim the fundamental national principles, even in the pres-

Digitized by Google

ence of the gods of heaven and earth, to establish the way for the public welfare. Ye, Our subjects, shall be united all together, according to these principles." In August of the same year, the formal celebration of the Emperor's ascension to the Throne was held at the central palace, and in September the year-name Meiji was given.

Removal of the Capital The Emperor Meiji paid his first visit to Tokyo in the first year and made the castle of Yédo his permanent palace in the second year of the new era. The Government was subsequently removed to Tokyo.

The Organization In the first year of Meiji, 1868, a new Central Government was established in accordance with the five principles above mentioned. It was called Dajokan, or Great Government, and there were seven departments in it. The council played the part of the future parliament; the five departments of general political, religious, financial, military and foreign affairs were administrative; and the last, the penal department took charge of justice, and the mutual independence of the legislature, the executive and the judicature was for the first time established. In a few years several adjustments were made, but by the fourth year all the official machinery of the central government was systematically arranged.

Surrender of Fiefs The Imperial Court had confiscated all the territory belonging to the old Shogunate, and set up prefectural offices and appointed governors, but the feudal lords still owned their lands and their feudal subjects. In the first year of Meiji, Takayoshi (Koin) Kido submitted an opinion on the surrender of all feudal possessions to the Emperor to complete the purpose of the Restoration, through Sanétomi Sanjo and Tomomi Iwakura; and at the same time he advised Lord Mori, Daimyo of Nagato, to return his territory to the Court. The latter was quite willing to do so, thereupon Takayoshi Kido worked with Toshimichi Okubo and succeeded in getting the consent of Lord (Daimyo) Shimazu of Satsuma, Lord Nabéshima of Hizen and Lord Yamanouchi of Tosa. These four lords tendered their petition for the territorial surrender in joint signature. Other lords followed them, and their petition was accepted in the second year. The lords gave up all their land and people, asking for nothing in return in a most admirable spirit of patriotism and loyalty. For the time being they were requested to continue as governors of their districts, and the feudal system was completely destroyed.

The country was divided into 8 urban prefectures, 26 prefectures and 262 clan districts. But the governors of clan districts, the former feudal lords, governed their people mostly in the old style, preserving the "chief-and-subject" relationship. The orders and ways of administration were greatly distorted and the authority of the Central Government was ineffective. Fortunately, however, Yoshii of Gumma and Sayama of Osaka soon resigned their governorships, realizing the defects of the system, and many others followed their lead. Kido again was quick enough to grasp the situation, and taking advantage of the general trend he endeavoured with his powerful friends Toshimichi Okubo and Takamori Saigo to do away with the clan governors and unify the whole nation under the same form of prefectural government. The Emperor called all the clan district governors to Tokyo in 1871, and kindly explained to them about the abolition of their office. They were given conveniences to live in Tokyo, and were replaced by the prefectural governors. Through many changes, the country was finally divided as at present into one "Do" or district, three urban prefectures and forty-three prefectures in 1889. (Foreign relations are dealt with in Chapter VI.)

Social Reforms

After the cessation of samurai government the social system could not remain unaltered. In 1869, when the resignation of the lords was accepted, the names "Kugé" (court noble) and "Daimyo" (feudal lord) were abolished and the nobles and lords were all made "Kazoku" (flowers of the nation) or peers. Clan samurai were given the class-name of Shizoku, and in the following year the common people were allowed to take their own family names, which they had not previously borne. In 1871, intermarriage was permitted between the peers and Héimin or common people, while the peers and Shizoku were allowed to engage in the ordinary business of agriculture, industry and commerce. Thus the social castes of the feudal age were entirely broken to pieces. Social institutions and customs changed also. With the official recognition of friendly intercourse with foreign people, international traffic and relations became busier and more intimate. Many a Japanese who went abroad brought back Western customs and introduced new institutions, and the people were quick to adopt them in their daily social

Digitized by Google

life. In the second year of Meiji telegraphic communication was opened between Tokyo and Yokohama; in the fourth year, the regular mail service between Tokyo, Kyoto and Osaka was begun; and in the fifth year, the first train ran between Tokyo and Yokohama. In the fourth year, men were ordered to cut off their topknots and walk on the streets without wearing swords. In the same year, laws regarding European costumes and uniforms of officials were issued, the old lunar calendar was discarded and the solar calendar was adopted in its place, and national holidays were newly appointed. In 1871, the Department of Education was added to the Government and, in 1872, the national educational system was established and it became compulsory for all children to be sent to public elementary schools. Buildings in European styles began to appear in the cities and people gradually acquired a taste for foreign food.

New Military System

After the appearance of the Samurai class in the middle age they held all the military power in their hands, and the people at large had nothing to do with it. But with the reforms following the Restoration, the military system was also revised and in the fifth year of Meiji the provisional Department of Military Affairs was changed into the two departments of Army and Marine, and in the following year the law of conscription was issued and, in accordance with the old-time ideas of the Japanese and on the pattern of most of the European powers the people were all ordered to share in universal military service for the protection of the country. The military system made singular progress through the many national crises of the Meiji Era.

Cultivation of Hokkaido

At the beginning of the Meiji Era the cultivation of the waste land of the north was proposed, and in the second year the Colonization Bureau was opened. The name Hokkaido, or north-sea-district, was given to the land, formerly known as Ézo. In the third year, Kiyotaka Kuroda was appointed vice-president of the Bureau and he made untiring efforts to civilize the natives, to construct roads, to promote industry and to encourage immigrants from the other islands. In 1875, he invited the Samurai class of the three northeastern prefectures of the Main Island to form a colonial militia to guard and cultivate the land at the same time. The farming and other population of Hokkaido has rapidly increased since. A troublesome question in the north was the boundary between Japan and Russia. The Shogunate had several diplomatic negotiations with the Russian admirals, and at the beginning of the Meiji Era this question again arose with the opening of the Colonization Bureau. Japan's wish was to divide the Island of Saghalien into two with the border line at 50° north latitude. Kuroda wished to abandon Saghalien and concentrate all efforts on the colonization of Hokkaido, and the Government sent Vice-Admiral Takéaki (Buyo) Énomoto to Russia and tried to settle the question. In 1875 a compromise was reached and the whole of Saghalien was adjudged to belong to Russia and all the Kurile Islands were given to Japan. This so-called exchange of Saghalien and the Kuriles finally settled the long dispute over Japan's northern boundaries.

Civil Wars

The Cause The political and social reforms of the Meiji Restoration were so vast in scale and so rapid in progress that the mass of the people could hardly understand their need and meaning, being still prone to the old ways and systems. There were some who were offended by various policies of the Government. These people became a constant cause of political and social unrest, there were repeatedly assassinations of high officials; while in the country districts disturbances broke out one after another. Shimpéi Éto, caused some trouble in Saga prefecture; but he was soon subdued by the Imperial army. In Kumamoto, an adjacent prefecture to Saga, Otaguro and others formed a party called the Jimpuren or Divine-wind-party, and made an attack on the Kumamoto garrison in 1876, only to be defeated by the soldiers of the garrison. At Hagi, the north-western end of the Main Island, Maéhara rose in accord with the Jimpuren party, but he was killed and his men dispersed.

The Saigo Rebellion Takamori Saigo could not realize his ideas about the Korean problem, and was deeply grieved at the failure. After his resignation he went back to his native place, Kagoshima, at the southern end of Kyushu Island. Over a hundred officers and soldiers who had been under him in the Tokyo Imperial Guard followed him to the city thus causing a great commotion in the country. His followers, such as ex-major-generals Kirino and Shinowara, elected Saigo to the leadership of their party and the head of their

Digitized by Google

private school. In 1877 Saigo, Kirino and Shinowara gathered an army of over 15,000 soldiers, proclaiming their intention of impeaching the Government for its social and political failures, and came up to Kumamoto and besieged the Kumamoto castle of the Imperial garrison. But the commander of the garrison, Major-General Tatéki Tani, bravely fought against Saigo's army and did not surrender. The Emperor Meiji was then travelling in the districts near Kyoto and Osaka, and stopped in Kyoto to take command of the Imperial army. He appointed the Imperial Prince Arisugawa to be Commander-in-Chief, and Lieutenant-General Aritomo Yamagata and Vice-Admiral Sumiyoshi Kawamura to be the heads of the army and navy respectively. Saigo's troops were compelled to raise the siege under the pressure of the big Imperial armies, and they retreated in disorder back to Kagoshima, and made Shiroyama their final stronghold. Shiroyama was a promontory in the outskirts of the town and there the great Saigo killed himself with his colleagues in the face of the assailing Imperial soldiers. This rebellion was really the last of the civil wars accompanying the Restoration. After this South-Western Civil War, the wounded soldiers, loyalist and rebel alike, were cared for impartially at the Imperial army hospitals, and the Emperor Meiji, the Empress and the Empress-Dowager showed them special kindness. It may be mentioned that the Japan Red Cross Society was founded on this occasion.

Dawn of Constitutional Government

The Genro-in In the first year of Meiji, government institutions were reformed in many ways, and representatives of prefectures were made members of the lower council. In the following year the public assembly was opened, and the prefectural representatives became its members. But this assembly consisted of members who were all chosen by the Government, and it gave rise to a demand for the establishment of an assembly of representatives really elected by the people. In 1873 Kido, who had come back from his European tour of investigation, proposed the establishment of the national constitution; while in 1874, Soéjima, Goto, Itagaki and Éto presented a petition for the establishment of parliament by popular election. The Government did not adopt either proposal as the time was not yet ripe, but in 1875 they established the Genro-in, a kind of Senate, as the chief seat of legislation, and the Supreme Court of Judicature for the administration of justice, and summoned district governors to Tokyo to learn of the requirements of the people. In 1876, the Emperor ordered the Genro-in to make plans for the formation of the Imperial Constitution and in 1879 prefectural assemblies were opened for deciding on district finances and representative government was first tried in the local districts.

Prefectural Elections The South-Western Civil War was ended and the foundation of the Central Government became unshakable. But in a few years Japan lost most of her able statesmen one after another. Saigo died in the battle just mentioned, Kido passed away from illness, and Okubo was assassinated in 1878. These were the three pillars of the Reformation, and Shigénobu Okuma, Hirobumi Ito and the like had to carry on their strenuous task. Public faith in these new statesmen was not yet assured, but they were young and progressive and endeavoured to absorb Western ways and civilization for the benefit of the rising generation. In April, 1878, the second local governors' conference was held and Ito was its chairman. The items for discussion were rules on prefectural assemblies, local taxes, and the organization of towns and villages. In July of the same year the rules on prefectural assemblies were issued, and according to the articles public election of representatives and local self-government were for the first time to be put into practice in the following year. This was a further step toward constitutional government. As a matter of fact, it might be considered a rehearsal of the formation of a national diet. The election was most sincerely carried out, because the people honoured the candidates as those who must in truth represent them not only in wisdom and political ideas but also in personality and social standing. The result was that the prefectural assemblies were composed of the best class of men in the districts. For instance, the chairman of the Tokyo prefectural assembly was Genichiro Fukuchi and the vice-president was Yukichi Fukuzawa, founder of Kéio-Gijuku University, while the members were all men of honour. The famous members of the Imperial Diet and great statesmen of later days mostly came out of these primitive local assemblies.

Political Dissensions Political dissensions, which had appeared even under the turmoil of military struggles, came

Digitized by Google

to the fore, and hot discussions on both sides were carried on both in debates and through printed pamphlets. The one who attracted most public attention with his progressive opinions was Taisuké Itagaki of Tosa. In September, 1878, a meeting was held at Osaka under the leadership of Itagaki's society to pass a resolution calling for the realization of the national assembly. It was a meeting of Samurai-class people as yet. But their second meeting, in March, 1879, gathered together 80 members who represented 21 societies in 19 prefectures, and the third meeting in November made resolutions to send a petition to the Emperor, and drafted a letter with a long heading, "Letter of Appeal to the Public for demanding the establishment of the National Assembly," which was printed and distributed among the people.

Petition for Opening Diet In the city of Okayama, a little west of Kobé, hot-blooded young politicians composed a manifesto and distributed it, this moved their youthful contemporaries more strongly than the first had done. When the fourth meeting of the Patriots' Society was held at Osaka in April, 1880, 114 delegates from the 87,000 members of different societies met together, formed the "Volunteers' Association for Demanding the Opening of the National Assembly," and drafted a petition. It is said that over 50 such petitions were presented to the Government during the one year of 1880. In the midst of such movements a new scholar of French politics, Kimmochi Saionji, the last Genro or Elder Statesman came back from Paris and published the "Toyo Jiyu Shimbun" (Eastern Liberal News), and to the great surprise of the authorities, instructed the people in the principles of liberal politics. The acute state of affairs seemed to presage the early appearance of an Imperial Diet when the political events of 1881 occurred.

Imperial Edict Issued In that year the Government was going to sell to the Kansai Trade Society the land, buildings, ships, dock and hunting fields which belonged to the Colonization Bureau. The actual price was estimated at a little over ¥360,000, while the Government had invested and spent as much as ¥14,096-809 on them. There was a strong suspicion of favouritism for the Kagoshima merchants of the said Society, for many of the high officials came from that district, and criticisms arose against the abuse. This public criticism caught up by those who demanded liberty and they bitterly censured the official autocracy. The very evening of his return from a tour of the north-eastern districts on the 11th of October, the Emperor Meiji gathered together the members of the Cabinet and the councillors and a meeting was held in his presence at which it was resolved that the government sale should be stopped at once and that the Imperial Diet should be summoned in the twenty-third year of Meiji, (1890). These resolutions were published in the Imperial edict issued on the following day, October 12th, 1881. With the issuing of this edict the boisterous outbursts of discussion and debate among the people gradually died down and political parties began to be organized for carrying out their political principles in readiness for the opening of parliament ten years later. The principal ones were the Jiyu-to, Liberal Party of Taisuké Itagaki and the Kaishin-to, or Progressive Party of Shigénobu Okuma.

Preparation of Constitution In 1882 the Government sent Hirobumi Ito to make thorough investigations regarding Western institutions, to find good models and suggestions for the Japanese parliament. Ito and his attendants mostly stayed in Germany and there studied Western politics and constitutions, and came back in the following year. In 1884 the Government established an Investigation Bureau in a part of the Imperial Palace and appointing Ito the president of the Bureau, ordered him to make a draft of the Constitution and plans for the new institutions. It was in this year that a law for the peers was enacted and the five ranks of nobility—prince, marquis, count, viscount and baron—were first defined. In 1885, at the instance of Prince Sanjo and to lay the foundation for true constitutional government, the officialism of the Central Government was reformed and a real cabinet of a modern nature was formed for the first time, the old positions of councillor and minister being abolished. It consisted of the Premier and Ministers for Home Affairs, Foreign Affairs, Finance, Army, Marine, Justice, Education, Agriculture and Commerce, and Communications. The function of these ministers was to take joint responsibility on national politics in place of the Emperor and help him in good government over his faithful subjects. In the Court there were the Naidaijin or Grand Keeper of the Imperial Seals and the Minister of the Imperial Household. The first Premier was Ito himself, who held the additional post of the Ministership of the Imperial Household. In 1888 the Privy Council was established,

Digitized by Google

the most excellent and patriotic statesmen were appointed to its membership, and it was made the highest body for Imperial consultation on important political affairs. Ito also was the first President of the Privy Council. The draft of the Constitution was completed by this year and the Emperor put it before the Privy Council as the first item of discussion. The Emperor Meiji was present at all sessions on the Constitution, earnestly listening to the opinions of the different members, and playing a great part in framing and discussing the resolutions.

Promulgation of the Constitution On the 11th February, the 2,549th anniversary of the accession of Jimmu Tenno, 1889 in Western reckoning, the Emperor Meiji reverently reported the promulgation of the Constitution to the ancestral gods and appeared in person with the Empress before the Imperial Princes, Cabinet ministers, high officials, representative people, and foreign ministers, and solemnly issued the Imperial Constitution (See Appendix). He is sued an accompanying law relating to the Imperial family which regulated future accessions, and relative positions of the Imperial Princes, that no trouble might ensue on the question of the successor to the Throne. Other laws which were to accompany the Constitution were on the election of the members of the lower house of parliament and the institution of it. They were issued in the same year, and in November, 1890, the first Imperial Diet was convened in Tokyo and the opening ceremony was held in the presence of the Emperor. Local self-government had been established and improvements made in the institutions of cities and towns for the past two years, and in this year another improvement in the prefectural and county institutions was made, confirming their self-government, although county government was abolished later.

Laws Since the downfall of feudalism and return of fiefs to the Emperor, enacted uniform laws for the proper control of the people became an acute necessity and the Government first took in hand the criminal laws and issued revised ones in the sixth year of Meiji. Other laws were revised or newly compiled according to the need of progressive society and with due regard to foreign relations. The code of civil procedure, the commercial law and the civil law were enforced by 1899. The criminal law was revised in 1908 and the code of civil procedure in 1924 according to the advanced ideals and needs of the times.

Revision of Treaties
(See Chapter VI)

Sino-Japanese War

In August, 1894 Japan declared war against China, the Emperor setting-up his headquarters at Hiroshima. Lieutenant-General Notsu routed the Chinese soldiers and drove them back from the boundaries of Korea in that month, and Vice-Admiral Yukyo Ito, Commander-in-Chief of the combined fleet, defeated the Chinese North-Sea fleet on the Yellow Sea. In October, Commander Aritomo Yamagata led his First Army through Chosen to Southern Manchuria and advanced victoriously to the west, while Commander Iwao Oyama, head of the Second Army, crossed the Yellow Sea and entered China direct, to act in conjunction with the Imperial fleet on the sea. Port Arthur was captured in November and Weihaiwei in February, 1895, and the Chinese naval power was annihilated. In March, the peninsula of Liaotung was seized by the Japanese armies and Peking was threatened by attack, while Southern China lay at the mercy of the Japanese fleet. The Emperor Meiji appointed Imperial Prince Akihito Arisugawa generalissimo over the whole army and navy to reduce China to submission. China yielded and asked for peace, appointing Li Hung-chang ambassador. Japanese ambassadors Premier Ito and Foreign Minister Mutsu met him at a peace conference at Shimonoséki. According to the peace treaty concluded in April, 1895, China recognized Korean independence, gave Japan the Liaotung Peninsula, Formosa and Boko Islands, paid about ¥300,000,000 to her, and opened four new ports for trade.

Return of Liaotung In alliance with Germany and France, Russia intervened and advised Japan to give back the territory to China, and the Peninsula was returned to China at the end of 1895 for an indemnity of about ¥45,000,000.

The newly acquired territory of Formosa was first governed by Governor-General Kabayama. In 1896, the whole island of Formosa was pacified and the new people began to understand the Japanese rule. In 1898 Gentaro Kodama became the Governor-General and encouraged industry and improved traffic so much that the island was really transformed into a valuable part of the Empire. After the Sino-Japanese War, the Japanese Government and people united their efforts in many enterprises.

Digitized by Google

Military preparations were strengthened, schools improved in number and quality, industry and commerce throve, communications were also greatly improved, and the national power remarkably augmented. In 1897 Japan adopted the gold standard, on the foundation of the gold coin received from China as indemnity.

The Boxer Rebellion In the meanwhile, anti-foreign feeling began to spread among the Chinese people, and, in 1899, the so-called "Boxer Rebellion" suddenly broke out in Shantung. The rebels hoisted the banners of "protect China, exterminate foreigners", murdered many Christian missionaries, destroyed churches, and, in the following year, advanced to Tientsin and attacked the residences of Europeans there. Later they united with the Government soldiers controlled by the Empress-Dowager and coming up to Peking attacked the foreign legations, some Japanese and German delegates being killed. Japan headed the combined forces of the Powers which marched on the capital for the relief of the legations. The Chinese yielded, asked for peace, punished the leaders of the anti-foreign movement, and agreed to pay a 450,000,000 tael indemnity, and to send delegates to Japan and Germany to make apology.

Anglo-Japanese Alliance After the experience of the North China incident, England abandoned her historical policy of "splendid isolation" and allied with Japan in 1902 for mutual help in Far Eastern problems. According to the terms of alliance, Japan and England were to be united in maintaining Chinese and Korean territorial integrity and to help each other if any two other nations united to attack either one of the allies in the Far East.

Russo-Japanese War

Russia Reluctant to Go Under pressure of the Anglo-Japanese Alliance and the American Government, Russia promised China to return Manchuria, but was by no means ready to keep her promise and on the contrary, in 1903, she sent larger armies to Manchuria and was busy constructing permanent strongholds at Port Arthur, dispatched warships to the port, appointed Alexeiev, Governor-General with his headquarters at Port Arthur, acted as the sovereign power in diplomatic, civil and military affairs in the Far East, and in August of the same year invaded the northern part of Korea. This unrestrained Russian advance menaced the territorial integrity of Korea, the existence of Japan, and the peace of the Far East, and Japan was compelled to take a firm stand against these designs, proposing a mutual understanding about the limitations of rights of both nations to avoid the impending danger of collision. But during the course of the negotiations, Russia continued to menace Japan, treating her with contempt and preserving her own aggressive attitude. The Japanese final proposal on the problems in Manchuria, of the 12th January, 1904, was left unanswered by Russia for two weeks, and the Imperial declaration of war against Russia was issued on the 10th February, 1904.

War on Sea The combined fleet of Admiral Togo immediately attacked the Russian warships off Port Arthur and Chinnampo and constantly pressed the Russian navy in Port Arthur. The warships in Vladivostok often came out into Japanese waters, harassed the communications of the Japanese army on the continent and hindered the transport of soldiers, but they were also destroyed in August by the second squadron under Rear-Admiral Kamimura.

War on Land On land, General Kuroki headed the First Army and marched into Manchuria through Korea in May; the Second Army, with General Oku in command was landed on the Liaotung peninsula and devising a united stratagem with the Fourth Army, General Notsu, defeated the enemy in every place, and the three armies simultaneously advanced to Liaoyang. In June the Emperor ordered Generalissimo Oyama, Commander-in-Chief of all the armies, and General Kodama, Chief of the General Staff, to go to the front, and they spurred the whole army to victory over the Russian soldiers in the town. In October the Russian reinforced armies came down to retake the town, but the Japanese armies encountered them at Sha-ho and defeated them.

In the meantime the Third Army under General Nogi turned from Liaotung to the attack of Port Arthur. Nogi began the famous but awful siege warfare, and captured the so-called "203-metre hill" in December. In January, 1905, General Stoessel, head of the Russian garrison, surrendered to General Nogi and sued for peace.

After the unsuccessful Battle of Sha-ho the Commander-in-Chief of the Russian army, General Kuropatkin, gathered over 600,000 soldiers at Mukden and awaited his chance. In February, 1905, the Japanese Manchurian armies were reinforced by the Third Army from Port Arthur and General Kawamura's Yalu River army, and rallying 400,000

Digitized by Google

soldiers they advanced towards Mukden from three directions. After a fierce battle of 14 days the Japanese armies defeated the immense armies of the enemy, who returned to the north in a complete rout. This momentous event took place on the tenth of March, 1905.

The Baltic Fleet Before the downfall of Port Arthur and the defeat at Mukden, Russia had seen that the weakness of her naval power in Japanese waters delayed any possible victory over Japan. She therefore formed the Second and Third Pacific Squadrons out of her Baltic fleet and sent them to the Pacific under the leadership of Vice-Admiral Rozdhestvensky. The Russian squadron made a long voyage to the Far East and Togo was able to make full plans to meet them in the most convenient place for the Japanese fleet. Had the Russian warships safely entered the port of Vladivostok the defenceless shores of Japan would have been exposed to their bombardment while the Japanese Manchurian armies might have been starved to death, unable to get supplies from the home islands. Togo was right when he hoisted high on the main-mast of his flagship the signal, "The fate of Japan will be decided with this battle; every sailor is requested to exert his best for the country," at the moment the outlines of the Russian fleet came into sight. The 38 boats of the two Russian squadrons sailed straight in majestic lines for their destination across the East China Sea. Togo kept the utmost secrecy as to his hiding place and chose the narrow Tsushima Straits to encounter the Russian fleet. It took only a few hours from the evening of the 27th May to the following morning to sink most of the Russian warships or blow them to pieces, and Rozdhestvensky and his staff were taken captive. In July of the same year a part of the Japanese army was landed in Saghalien and subduing the Russian resistance quickly captured the whole island.

The Peace Mr. Roosevelt, President of the United States seeing the disastrous conditions, financial and otherwise, which threatened both countries after the battles at Mukden and the Japan Sea initiated peace-proposals between Japan and Russia, and was successful in pursuading the rival parties to open a peace conference in America. Japan sent Jutaro Komura and Kogoro Takahira as her ambassadors extraordinary and plenipotentiary to Portsmouth to meet with the Russian ambassadors Witte and Rosen. The peace treaty was concluded in September, 1905. Russia recognized the supreme rights of Japan over Korea, surrendered the southern half of Saghalien to Japan, and handed over the special rights of lease which she possessed in Kwantung, the railroad south of Changchun and the mining of coal along it.

After the Russo-Japanese War

Post-war Readjustment The Russo-Japanese war raised Japan's position in world politics, putting her almost on the same level as the European Powers, especially in regard to Oriental affairs. The international relations of Japan with the Western Powers became so intimate and important that all of them exchanged ambassadors with Japan in place of the former ministers. In home affairs Japan made special efforts in the education of the people to keep abreast with the times. Industry in all lines leaped forward under the leadership of able business men. The state-ownership of railroads was realized to improve the traffic of the islands. The patriotic contributions of the business men and merchants after the war must not be overlooked. In 1906 Port Arthur was made a naval station for the defence of the Kwantung littoral, and the South Manchuria Railway Company was established to manage the railroad and mining business which had been handed over by Russia. Dairen and a part of Port Arthur were opened for international trade. In 1907 the Saghalien national boundary was fixed at 50° north latitude, and the Government opened an office there and encouraged the emigration of Japanese to the island.

Relation with Korea
(See Chapter VI.)

Treaties with Powers
(See Chapter VI.)

Blending of East and West Immediately after the Restoration the Government had been eager to invite and introduce all things Western, and the people had responded to the policy with alacrity. There followed, as a matter of fact, an age of Europeanization. It was during those days that so many Japanese treasures of Buddhism and fine arts went out of the country for very meagre amounts of money, and many beautiful old customs and precedents were carelessly dropped. But then came the victories over China and Russia to give confidence and conviction to the Japanese and turn them from a mere imitation of the West to the recognition of their own special abilities and valuable inheritances. Cries for the preservation of national characteristics were raised and the blending of

Digitized by Google

the Occidental and Oriental civilizations, the creation of a new Meiji civilization, was started and the nation began to make a steady and healthy advance in all phases of national life.

Demise of the Emperor Meiji In July, 1912, the Emperor Meiji passed away after only a few weeks of illness in his Tokyo Palace. His demise caused such profound grief among the people that an English correspondent was said to have telegraphed home "Japan is going into a decline!" with the death of the great Emperor. He died beloved of all, a love which was attested by the splendid Meiji Shrine which was built in his honour, and which draws more worshippers than any other shrine. The Emperor Yoshihito (the late Emperor Taisho) came to the Throne immediately after his father's death, according to the provisions in the Imperial code on the succession.

Taisho Era
(1912-1926)

The World War

Japan's Contribution In August, 1914, the World War broke out and Japan was compelled according to the terms of the Anglo-Japanese Alliance to take necessary steps to combat German activities in the Orient. She requested Germany to withdraw her war vessels from Japanese and Chinese waters, and to return Shantung by a fixed date to China. Needless to say, Germany did not comply, and Japan declared war in the same month.

Tsingtao Falls Japan lost no time in dispatching her army and navy to Tsingtao. The Second Squadron commanded by Vice-Admiral Sadakichi Kato blockaded the gulf while the First Squadron of Vice-Admiral Tomosaburo Kato kept watch over the Yellow Sea and other China north-eastern seas. The 18th Divisional Commander Kanwo attacked the fortress from behind, in conjunction with the navy. Some British troops also took part and they all besieged the fortress in October, 1914. The attack was so aggressive that in but ten days all the batteries were captured and in November the German Governor Waldeck and his staff surrendered the port and fortress. In deeper waters, the Japanese Third Squadron commanded by Rear-Admiral Tsuchiya kept watch over not only the China seas but also went as far as Philippine waters. A detachment of the First Squadron was sent to the South Seas and acting in concert with the British navy tried to destroy the German Asiatic fleet. The Marshall Islands were occupied in September, and the Mariana and Caroline Islands in October, and possession was taken of all German naval stations in the South Seas. British vessels met the German fleet in the Indian Ocean, and off the coast of South Africa, and destroyed it in December, 1914. Germany's strength in the Orient was thus completely wiped out.

Japan helped Russia also, chiefly by enabling her to attend to the War without any anxiety about Eastern affairs, and by supplying her with as much ammunition as she could. Russia was grateful for this friendly attitude of Japan and the relations between the two nations becoming more intimate a new treaty was concluded in 1916 to cooperate for the maintenace of perpetual peace in the Far East, and to negotiate freely with each other for the protection and defence of the special rights and territorial domination already recognized, instead of competing. With the progress of the World War, Japan dispatched a special-service fleet as far as the Mediterranean. The special-service fleet tried its best to protect trade and communications in that part by bravely and effectively attacking German submarines in co-operation with the Allied fleets and in harmony with the orders of the British Mediterranean Fleet Commander. In 1917 the Russian Revolution broke out in the midst of the War. The Romanoff dynasty was overthrown and the radical revolutionaries came into power and concluded a separate peace with Germany. This resulted in the permeation of the military influence of Germany and Austria into Russia and even to the Far East. A large body of Czechoslovak troops who had escaped into Russia, and were trying to make their way home to Europe by way of Siberia, suffered greatly in consequence. Japan kept a keen watch on these Russian disorders. In 1918 she sent ships to Vladivostok for the protection of the Japanese residents and to maintain order in that district for international benefit, in co-operation with the warships of other nations. And later, in agreement with America, Japan dispatched an army under General Otani to Vladivostok and helped the Czechoslovak army, in conjunction with the soldiers of other nations.

Japanese Massacred In March 1920 the Japanese garrison and citizens, about 700 in all, were massacred by Russian communists at Nikolaievsk. This caused intense indignation in Japan. She sent armies to Siberia immediately and occupied a part of the coast district

Digitized by Google

and the remainder of Saghalien. Negotiations were opened again between the two nations and in 1925 a new Russo-Japanese treaty was concluded. According to its terms Japan withdrew her soldiers from North Saghalien while Russia gave Japan the mining rights and freedom of cultivating under licence the oil-fields in that district (See Chapter VI on Foreign Relations.)

The Kanto Earthquake On Sept. 1st, 1923, Japan underwent the sad experience of the Kanto earthquake, in which tens of thousands of houses were destroyed or damaged in Tokyo, Kanagawa, Shizuoka, Saitama and Chiba prefectures, and a hundred thousand people were killed or injured, with an estimated loss of several thousand million yen. (See Chapter I.) The great fires caused by the earthquake in Tokyo and Yokohama caused far more deaths than those which were directly attributable to the shocks. But, undaunted by the terrible disaster, the people not only of the metropolis but of all Japan stood up in a splendid spirit of determination to reconstruct all her damaged cities and towns by the help of the sympathetic nations of America and Europe. The wonderful improvement in the streets and buildings of the new cities materially exhibited the strength of Japan's national power, so that the great earthquake rather quickened than retarded the splendid advance of Japan as a whole.

Demise of the Emperor Taisho In December, 1926, the Emperor Taisho passed away at the Hayama Winter Palace and the Regent, Crown Prince Hirohito, succeeded him as Ruler, the year-name of Showa, or Enlightened Peace, being given to his era. Under his rule Japan is continuing her painstaking efforts to keep pace with world progress and cope with complicated international relations.

The birth of Manchoukuo in 1932 and the trade and industrial expansion in recent years have greatly strengthened Japan's position in the Orient.

Chronicle of Important Events

Age of Traditions
(660 B.C.–531 A.D.)

1. Beginning of the Empire
   - 660 B.C.—The Emperor Jimmu ascended the Throne at the Kashiwara Palace, Unébiyama, Yamato province, near the present Nara.
2. Subjugation of Clans and Tribes.
   - 88 B.C. Neighbouring clans subdued by the armies of the Imperial Princes.
   - 11 A.D. The Great Shrine of Isé built by the Emperor Suinin in honour of Amatérasu-Omikami.
   - 97–110 Clans and tribes in Kyushu and the eastern half of the Main Island subdued by the armies of the Emperor Kéiko and Prince Yamatotakéru his son.
   - 135 The Emperor Séimu divided his dominion into administrative districts.
3. Intercourse with Korea
   - 200 The Empress Jingo conquered Silla.
   - 285 Confucianism introduced.
   - 313 The Emperor Nintoku established the capital at Naniwa (Osaka) for the convenience of intercourse with Korea.
   - 463–512 Troubles with Korea.

Age of Foundation
(532–709)

4. Introduction of Continental civilization.
   - 552 Buddhism introduced.
   - 562 Japanese Office in Mimana is destroyed by Silla.
   - 593 Imperial Prince Shotoku became Regent, and propagated Buddhism, building Horyuji and other temples.
   - 604 The Regent Shotoku proclaimed the Constitution.
   - 607 An Embassy sent to Sui.
   - 630 An Embassy sent to Tang.
   - 645 The Sogas punished and extirpated.
   - 592–645 The Asuka or Empress Suiko's Period of Art history.
5. The Taika (Taikwa) Reformation and After.
   - 645 The custom of 'year-names' introduced, the first one being called Taika (great reformation).
   - 646 The Taika Reformation.
   - 660 Ézo (Hokkaido) subjugated by the army of Hirafu Abé.
   - 663 Control over the Korean Peninsula abandoned.
   - 701 The Taiho Law promulgated and the organization of the Imperial Government is fixed.

646–707 The Hakuho Period of Art history.

Nara Age
(710–793)

6. Establishment of the Capital at Nara and Compilation of a History of Japan.
   - 710 The Empress Gemmyo founded Nara as her capital.
   - 620–720 The first books of Japanese history, Nihon Shoki (Japanese Annals) and Kojiki (Antiquities) compiled.
7. Spread of Buddhism and Progress of Religious Fine Art.
   - 747 Building of Todaiji temple and other provincial temples.
   - 756 The Empress Kōmyo donated the treasures of the late Emperor Shomu to Todaiji temple. They are kept in the Shosoin Museum, built a little later.
   - 769 Dictatorship of Dōkyo, Buddhist pope, opposed by the great loyalist Kiyomaro Waké.
   - 710–781 The Tempyo Period of Art history.

Héian Age
(794–1191)

8. Founding of Héian (Kyoto) the Capital, and troubles in the north.
   - 794 The Emperor Kammu founded the new capital Héian and the Government removed there from Nara.
   - 801 Revolts broke out in Ézo, finally subdued by the expedition of Tamuramaro Sakanoué.
   - 794–800 Establishment of governmental and private schools.
   - 794–887 The Konin period of Art history.
9. Rising of the Fujiwaras.
   - 858 Yoshifusa Fujiwara assumed the Regency.
   - 887 Mototsuné Fujiwara the Daijo Daijin and Regent became Kampaku (Chief Councillor) at the same time.
   - 901 Michizané Sugawara, candidate for Kampaku reduced to the position of governor of Kyushu by the Fujiwara scandal.
10. Foreign Relations.
    - 894 Official intercourse with Tang broken off by the advice of Michizané Sugawara.
    - 727–900 Bokkai, a maritime monarchy in Manchuria, traded with Japan.
11. Disorder in Rural Districts and Rise of the Samurai.
    - 939 Masakado Taira rebelled and proclaimed himself Emperor.
    - 941 Sumitomo Fujiwara disturbed the coasts of the Inland Sea but is suppressed.
    - 950 The Samurai families of Minamoto (Genji) and Taira (Héishi or Héiké) gradually rose to power.
12. Fujiwara Despotism.
    - 1016 Michinaga Fujiwara assumed the Regency for the next 20 years and his son Yorimichi for 50 years. Climax of the Fujiwara despotism and prosperity.
13. Incessant Wars.
    - 1019 Toi tribe in the north-eastern part of Korea invaded the islands of Iki and Tsushima.
    - 1028 Tadatsuné Taira's treason in Shimoosa province.
    - 1039 Armies of Buddhist monks rose in revolt.
    - 1054–1062 The Abés in the Ohu district declared independence.
    - 1086 The ex-Emperor Shirakawa took part in politics for nearly 40 years and set a precedent for government by ex-Emperors.
    - 1085–1087 The Ohu district again disturbed by the Kiyowaras.
    - 1087 For about a century the family of Kiyohira Fujiwara who subdued the Kiyowaras ruled over the Ohu district.
    - 1156 Strife between the armies of the Emperor and the ex-Emperor (Hogen war).
    - 1159 The Fujiwaras and Minamotos waged war against another branch of the Fujiwaras and the Tairas (Héiji war).
14. The Gen-péi (Minamoto and Taira) Period.
    - 1167 Kiyomori Taira promoted to Daijo Daijin.
    - 1167–1180 Autocracy of Kiyomori and his family.
    - 1180 Rise of the Minamotos in rivalry to the Tairas. Yoritomo Minamoto established headquarters at Kamakura.
    - 1185 The Tairas destroyed by the armies of Yoshitsuné, brother of Yoritomo.
    - 1185 Yoritomo appointed local military police and tax-gatherers for rural districts.

889-1185 The Fujiwara Period of Art history.

Kamakura Age
(1192-1337)

15. Beginning of the Kamakura Shogunate Régime.
    1192 Yoritomo Minamoto promoted to Séii-Taishogun (Generalissimo) and the Shogun Government formally sanctioned. For the next 675 years Japan ruled by the samurai statesmen.
    1204 Tokimasa Hojo became chief executive of the Shogunate régime.
    1219 Minamoto Shogunate ended with the third Shogun, Sanétomo. But Masako, widow of Yoritomo, (called the 'Ama' or Nun Shogun) officiated as Shogun for several years.
    1221 Trouble between the Kyoto Court and the Hojos (Shōkyu affair).
16. Hojo Rule.
    1224 Yasutoki Hojo became chief executive of the Kamakura Shogunate.
    The Hojos continued to exercise the Shogun's duties for over a century.
    1232 The Joéi Code promulgated for the discipline of the samurai.
    1274 Yuan invasion.
    1281 Second Yuan invasion and defeat by the armies of Tokimuné Hojo, the chief executive.
    1324 An attempt for the restoration of the Imperial Rule.
    1331 War between the Imperial and the Hojo armies.
    1333 The Hojos destroyed.
17. The Emperor Godaigo and Takauji Ashikaga.
    1333 Temporary restoration of the Imperial direct rule by the Emperor Godaigo.
    1335 Takauji Ashikaga rebelled against the Emperor.
    1336 Masashigé Kusunoki, famous loyalist, died in the battle of Minatogawa (Kobé).
    1336 The Emperor Godaigo moved to Yoshino mountain.
    1336 The Imperial House divided into two, the South and the North (Yoshino and Kyoto) for 57 years.
    1192-1337 The Kamakura period of Art history.

Muromachi Age
(1338-1602)

18. Beginning of the Muromachi Shogunate and the luxurious age of Yoshimitsu.
    1338 Takauji Ashikaga proclaimed himself Shogun and established the Muromachi Shogunate in Kyoto.
    1342 Takauji sent the Tenryuji-buné (trade boats) to China.
    1368 Yoshimitsu Ashikaga publicly appointed Shogun and the Muromachi Shogunate officially sanctioned.
    1399 The Ōéi Rebellion.
    1401 Yoshimitsu traded with Ming: indulged in luxurious living.
19. Corruption of the Muromachi Shogunate and Political Commotion.
    1438 The Éikyo Rebellion. Rising of military lords in Kanto district.
    1441 The Kaki Rebellion.
    1467-1475 The Ohnin war: Kyoto reduced to ashes in the street fighting. The Court and the Shogunate both lost power and the whole country became a scene of warfare among the military lords.
20. A Century of Civil Wars Among the Feudal Lords.
    1491 Soun Hojo captured Odawara Castle and ruled over the Kanto district.
    1476-1573 Feudal lords struggled for supremacy, the greater lords being as follows: Kanto district; Hojo, Uésugi. Ohu district; Daté, Ashina, Mogami, Tamba, Akita. Central district; Uésugi, Takéda, Imagawa. Kinki (Kyoto-Osaka) district; Saito, Asai, Asakura, Oda, Matsudaira. Chugoku (Western Main Island) district; Ukida, Amako, Ohuchi, Mori. Shikoku Island; Miyoshi, Kono, Chosokabé. Kyushu Island; Otomo, Ryuzoji, Shimazu.
    1543 Coming of the Portuguese.
    1543 Introduction of fire-arms.
    1549 Christianity introduced.
    1337-1573 The Muromachi Period of Art history.
21. The Oda and Toyotomi Period.
    1568 Nobunaga Oda came up to Kyoto by Imperial order and repaired the Palace.
    1571 Nobunaga destroyed Énryakuji

Digitized by Google

temple to suppress the power of the monks.
1573 Downfall of the Muromachi Shogunate.
1576 Building of the Azuchi castle.
1582 Nobunaga assassinated.
1582 Hidéyoshi Toyotomi's supremacy.
1588 Hidéyoshi promoted to be Kampaku and Daijo Daijin.
1590 Unity of the Empire realized by Hidéyoshi, all the lords completely subdued.
1592 Invasion of Korea by armies of Toyotomi.
1597 Second invasion of Korea.
1598 Hidéyoshi Toyotomi died at Fushimi castle (Momoyama Palace).
1574-1598 The Momoyama period of Art history.

Yédo Age
(1602-1867)

22. Beginning of the Tokugawa Shogunate.
1600 Battle of Sékigahara assured the supremacy of Iyéyasu Tokugawa (1542-1616).
1603 Iyéyasu appointed Shogun and founded the Yédo Shogunate.
1609 Began trade with Hollanders.
1609 The Loochoo Islands subjugated by Lord Shimazu.
1610 Sending of official letters to Nova-Hispania and Spain.
1612 Iyéyasu prohibited the preaching of the Catholic Faith.
1613 The lord Masamuné Daté sent Hasékura to Rome.
1613 Opened trade with the English.
1615 The Toyotomis destroyed at the Battle of Osaka.
23. Stabilization of the Yédo Shogunate.
1615 Proclamation of the Kugé Hatto (Court Nobles Law) and the Buké Hatto (Samurai Law).
1616 Death of Iyéyasu.
1623 Iyémitsu (1604-1651) became the third Tokugawa Shogun. Under his enlightened rule the position of the Yédo Shogunate became unshakable.
1630 Introduction of Western literature prohibited.
1636 Japanese forbidden to go abroad.
1637-1638 The Shimabara Rebellion.
1651 Death of Iyémitsu and attempted rebellion by Yuino Shosétsu and his colleagues.
24. The Golden Age of the Yédo Shogunate.
1657 Mitsukuni Tokugawa, lord of Mito began the compilation of the Dai Nippon Shi (Great Nippon History).
1687 The Shogun Tsunayoshi's Edicts for the protection of animals caused much loss of human life.
1688-1708 The Genroku Era of luxurious living.
1702 Revenge of the '47 Akao Ronin.'
1709 Hakuséki (Kunmi) Arai's Reformation.
1716 The 8th Shogun Yoshimuné regulated officialdom and improved the administration, reigned for 30 years.
1720 Yoshimuné loosened the Prohibition Law against Western books.
1759 Punishment of Takénouchi Shikibu, a loyalist.
1764 Norinaga Motoori commenced his commentary on the Kojiki (Antiquities).
1772-1784 Misrule of the Roju Okitsugu Tanuma.
Succession of natural calamities.
1787 Adjustment of the administration by the Roju Sadanobu Matsudaira (Rakuo).
25. Waning of the Shogun Régime.
1792 Punishment of Shihéi Rin (Hayashi) who warned the Government of possible invasion by foreign Powers.
1792 Coming of Laxsman to Hokkaido.
1804 Coming of Lesanov to Nagasaki.
1808 Coming of an English boat to Nagasaki.
1825 Shogunate order to shut out all foreign ships by force.
1830 Great famine of the Tempo Era.
1837 Rebellion of Héihachiro Oshio to relieve the starving masses.
1837 Coming of the American ship Morrison.
1841 The Roju Tadakuni Mizuno's attempt at reformation.
1842 The 1825 order removed. A step towards the 'open door' policy.
1842 Controversies between the anti-foreign party and the liberalists became hotter.
1844 King of Holland gave advice to the Shogunate.
1846 First request of America for the 'open door.'
1853 Arrival of the American fleet under Commodore Perry.
1853 Coming of the Russian delegate

Poutiatine to Nagasaki.

1854 Institution of the Sun Flag to symbolize Japan. (Sanctioned by the Meiji Government in 1870.)

1854 Conclusion of Amity Treaties with America, England and Russia.

1855 Conclusion of Amity Treaty with Holland.

1856 Arrival of the American envoy Townsend Harris.

1858 Conclusion of Commercial Treaties with Foreign nations by the Shogunate.

1858 The Ansei coup d'Etat by the Tairo Naosuké Ii.

1860 The Japanese envoy Masaoki Niimi sent to America.

1860 The Tairo Ii assassinated at the Sakurada gate of the Shogun Palace.

26. Downfall of the Yédo Shogunate.

1862 Rise of the Anti-Shogunate movement.

1862 The Namamugi Affair.

1863 The Anti-Foreign Law, and attack on foreign ships at Shimonoséki and Kagoshima.

1863 Defeat of the Anti-Foreign party; the seven Court nobles flee to Nagato.

1864 The Anti-Foreign party demanded the release of the seven Court nobles by force; battle at the Hamaguri gate of the Kyoto Imperial Palace.

1864 A combined fleet of America, England, France and the Netherlands bombarded Shimonoséki.

1865 Imperial Sanction given to the treaties of 1858.

1865-1867 Hostilities between the Shogunate forces and the army of the Choshu (Nagato) Lord who represented the Anti-Shogunate and Anti-Foreign Party.

1866 Demise of the Emperor Koméi.

1867 Ascension of the Meiji Tenno (1852-1912), the 122nd Emperor.

1867 The Emperor ordered armies opposed to the Nagato Lord to withdraw.

1867 Rapid progress of Anti-Shogunate movement and a definite scheme promoted by Sanjo, Iwakura, Saigo, Okubo and Kido.

1867 The Emperor gave orders to the lords of Nagato and Satsuma to move their armies against the Yédo Shogunate in compliance with the request of Sanjo, Iwakura and their colleagues, October 14.

1867 On the same day (October 14) the Shogun Yoshinobu Tokugawa asked Imperial sanction for the return of all authority of the Government to the Throne. On October 24 the Emperor complied with his request and accepted Yoshinobu's resignation.

1867 Proclamation of the Restoration, December 9.

1868 The rise of the lords and warriors loyal to the Shogunate. Battle of Toba-Fushimi. March of the Imperial armies to Yédo. Surrender of the Yédo Castle without bloodshed. Battles at Uéno, Utsunomiya and Aizu.

1869 Battle at Hakodaté, May, after which all disturbances in the wake of the political change completely subdued.

1602-1867 The Yédo period of Art history.

The New Japan

(1868-)

27. The Meiji Era.

1868 Enthronement of the Emperor Meiji.

1868 The first year of Meiji, beginning with September.
Proclamation of the Five Imperial Pledges.
Establishment of the Dajokan.

1869 Removal of the Capital to Tokyo.
Surrender of fiefs by the lords.
New organization of the Government.
Telegraphic communications opened.

1870 Ministers sent to foreign countries.
Social castes done away with.

1871 Japan is divided into 1 "Dō," 3 urban prefectures and 72 prefectures for administrative purposes. (The number being reduced in 1889 to the present 1 Dō, 3 urban prefectures and 43 prefectures.)
The people allowed to cut off their cues and the samurai forbidden to wear swords.

1872 Institution of the national school system.
The Loochoo Islands definitely

included within Japanese territory.
Opening of railway line between Tokyo and Yokohama.

1873 Adoption of the solar calendar.
Institution of the Conscription system of military service.
Controversy over Korean affairs.

1874 Expedition to Formosa.
Request for opening the House of Representatives.
The Saga Affair.

1875 Karafuto exchanged for the Kuriles.
First Convention of the local governors.

1876 Kumamoto incident, a reactionary movement by the Jimpuren band of Kumamoto Samurai. Similar events occured at Akitsuki and Hagi.

1877 The South-Western Civil War, the rebellion of Takamori Saigo and his colleagues.

1879–1890 Rapid influx of things and ideas from Europe, called Rokuméi-kan period.

1879 First opening of local assemblies.

1880 Promulgation of new penal code.

1881 Imperial Edict promising the opening of the national assembly.

1882 Hirobumi Ito sent to Europe for the study of Western constitutional governments.

1884 Drafting of the constitution started.

1885 Institution of the cabinet.
The Tientsin Treaty.

1886 Japan became a member of the International Red Cross Society.

1888 Institution of city, town and village divisions.

1889 Proclamation of the Dai Nippon Téikoku Kempo (The Constitution of the Great Empire of Japan), Feb. 11.

1890 The First Imperial Diet convened in November.
Issuance of the Imperial Rescript on Education.
Institution of the system of courts of justice and promulgation of court procedures.

1894 New Anglo-Japanese Treaty.

1894–1895 Sino-Japanese War.

1895 Shimonoséki Peace Treaty, April.
The Three Powers' Intervention and return of the Liaotung Peninsula to China.
Formosa ceded to Japan.

1898 Promulgation of the Civil Law.

1899 Promulgation of the Commercial Law.
Boxer Uprising in China.

1902 Anglo-Japanese Alliance.

1904–1905 Russo-Japanese War.

1905 Capture of Port Arthur, January 1.
Battle of Mukden, March 10.
Battle of the Japan Sea, May 27.
Portsmouth Peace Treaty, September.
Korea became Japan's protectorate, November.

1906 Establishment of the Kwantung Government-General.

1907 Opening of the Karafuto Office.
Promulgation of the Revised Penal Code.

1910 Annexation of Korea, August.

1911 Revision of the Anglo-Japanese Alliance.
Revision of Treaties with Western countries on equal footing.

1912 Demise of the Emperor Meiji, July 30.

28. The Taisho Era.

1912 Ascension of the Emperor Taisho, July 30.

1914–1918 The World War.

1914 Capture of Tsingtao, November.

1915 New Treaty with China. So-called '21 Demands'.

1917 Gold embargo.

1918 End of the World War, November.

1919 Conclusion of the Versailles Treaty.
The South Sea Islands mandated to Japan.
Japan became a member of the League of Nations.

1921 Crown Prince's tour to Europe.
Crown Prince became Regent.

1921–1922 The Washington Conference.
Termination of the Anglo-Japanese Alliance.

1923 Great Earthquake of Kanto district, September 1.

1925 Conclusion of Treaty with the U. S. S. R.
Promulgation of the new Election Law (Universal Suffrage).

1926 Demise of the Emperor Taisho, December 25.

29. The Showa Era.

1926 Ascension of the present Emperor, December 25.

1927 Financial Panic.

CHAPTER IV

GOVERNMENT

The Constitution

The fundamental source of all laws and ordinances, and of the administrative system is the Constitution of the Japanese Empire. This document, however, contains simply an outline of the principles involved, and there are many constitutional laws, written and unwritten, which condition the functioning of state organs. There are four fundamental sources of the laws of Japan; (1) the Constitution, (2) the Imperial House Law, (3) certain laws containing constitutional provisions, and (4) the unwritten constitution.

The Constitution of the Japanese Empire was promulgated on Feb. 11, 1889, and is composed of 7 chapters and 76 articles (given in full in Appendix). It was accompanied by an Imperial Declaration, the essence of which has the same legal force as the articles of the Constitution. In the declaration, the Emperor Meiji made four points clear: first, that the purpose of the establishment of the Constitution is to promote the welfare of his subjects and sustain the progress of the nation; secondly, that the monarchy of Japan is unchanged in form and identical with what it has always been, in the principles of the harmonious rule of sovereign and subjects and of constitutional and responsible government; thirdly, the proper means for revision of the Constitution, and that it limits not only the lawful actions of the subjects, but also the powers of the sovereign; and fourthly, the date of its coming into effect, that of the opening of the first session of the Imperial Diet on November 25, 1890.

The Highest Expression of State Will The Constitution was given by order of the Emperor and is the highest expression of the will of the State. All laws must conform to it, while the functions of the highest political organs of the nation are stated in it. But there is no means specified for prevention or correction of a breach of the Constitution by those organs, whether they be constitutionally established or not, except in so far as the interpretative power of the Privy Council, (See section on Privy Council), can be said to constitute such a check. Otherwise, this can only be provided for by the reciprocal restraint exercised by the Executive and the Legislature, the power of public opinion, or other means which are not specified by law. It must be remembered that not all the parts of the Constitution are new creations. Most of them are rather the expression of old laws in a new written form; many of the important political customs had already been incorporated in legal enactments before the Constitution came into being.

The Constitution does not include the whole of the law of the Constitution nor all the constitutional laws. It is one of the simplest constitutions in the world. For instance, such laws as the Imperial House Law or the laws concerning the composition of the Imperial Diet are not included in the Constitution, the reason being that, whereas the revision of these laws in accordance with changes in public thought may be necessary, it is undesirable that the Constitution itself should be revised easily and often. Revision of the Constitution must be initiated by the Tenno (Emperor), and the Imperial Diet has the power of deciding only on such revisions as are indicated by the Throne. No revisions have been made or constitutionally suggested since its establishment.

Other Constitutional Provisions The Imperial Household Law (See Appendix) mainly regulates matters concerning the Imperial Household and Family, but there are many constitutional provisions contained in it. Of special importance are the articles concerning the succession to the Throne and Regency, which determine the form of the sovereignty of the State and are therefore clearly of equal importance to the Constitution itself.

Other legal enactments containing constitutional provisions are the following: The Law of the Houses, the Imperial Ordinance concerning the House of Peers, the Imperial Ordinance concerning the Election of Members of the House of Peers, the Imperial Ordinance concerning the Cabinet, the Penal Law concerning the infringement of Ordinances, the Judicial Court Formation

Digitized by Google

Law, the Court of Administrative Litigation Law, and the Board of Audit Law, which were enacted simultaneously with the Constitution; the Imperial Ordinances concerning the Privy Council and the Military Establishments, which were enacted before the promulgation of the Constitution; the Electoral Law and the common law for the formation of departments of the central government, which were promulgated after the Constitution. In addition there are many examples of post-Constitution laws with minor constitutional provisions.

Unwritten Provisions The Constitution of Japan is a written one in principle, but it does not exclude all unwritten provisions. There are still some spheres of governmental action which are not regulated by any document. Moreover, there are many cases in which the written laws have to be interpreted by unwritten laws or by national political custom or reason. For instance, the relation of the Japanese nation to the Shinto Shrines, the relation of State and religion, the site of the capital, the nature of the National Flag, the Calendar, and the customary procedure of the Imperial Diet are not defined in written laws, but are nevertheless constitutional observances. Other political customary observances of importance are that the Cabinet is formed, as a rule, by the members of the majority party in the House of Representatives, and that the Genro, Elder Statesmen, (at present only one, Prince Saionji) are consulted by the Emperor on the choice of a new Prime Minister.

The Form of Government

The form of the Japanese Government is that of a constitutional monarchy. The Empire is ruled by the Emperor (Tenno) according to the first article of the Constitution, "the Empire of Japan shall be reigned over and governed by a line of Emperors unbroken for ages eternal." The representatives of the people in the Imperial Diet participate in the rule of the State, but have no sovereign power. Sovereignty belongs entirely to the Emperor and all power is exercised in his name only. The Japanese Reigning House is the oldest dynasty in the world and, in stability and historical continuity, the Japanese monarchy is unique in history. The actual power of the Emperor at the present time is much greater than that of other constitutional monarchs.

The actions of all governmental organs are regulated by the Constitution and the collateral laws and usages above mentioned, and all the organs are coordinated by the central government. The supreme power is concentrated in the State, and the exercise of sovereignty is all in the hands of the central government which gives orders to all other administrative organs.

The People

All Japanese subjects are registered with the census authorities according to the Law of Nationality, and are recognized as the constituency of the State and protected by the State laws. They are required to submit completely to the control and orders of the State. By the terms of the Constitution they may, subject to qualifications determined by law or ordinance, be appointed to civil or military offices equally and may fill any other public positions. They are liable to service in the army and navy and to the duty of paying taxes according to the provisions of law. The duties they owe to the State are numerous, but these two are specially mentioned in the Constitution.

Japanese subjects are guaranteed liberty of abode and of changing the same. Within the limits of law, they shall not be arrested, detained, tried or punished unless according to law, shall not be deprived of their right of being tried by the judges determined by law, except in cases provided for by the law, their houses shall not be entered or searched without their consent, the secrecy of their letters shall remain inviolate, and their right of property shall remain inviolate. They enjoy freedom of religious belief, speech, writing, publication, public meeting and association; and they may present petitions to the authorities in the forms provided by law.

The feudal social castes were abolished at the Meiji Restoration, and the class names of Kazoku (Peers), Shizoku (Samurai class), and Héimin (Common people) were given according to family standing and lineage. The two last are purely social and represent no political distinction. Peerage carries with it the privilege of membership of the Upper House of the Legislature (Kizokuin, House of Peers), subject to certain conditions. In 1884 the peerage was divided into the following five ranks: Prince, Marquis, Count, Viscount, and Baron. The class name of "Héimin" has fallen into complete disuse, while that of "Shizoku" is being rapidly forgotten.

Tenno, The Emperor

The Japanese Throne is hereditary. The custom was established with the

Digitized by Google

foundation of the State 2,597 years ago, and had been a constitutional unwritten law till it was clearly stated in the Imperial House Law by order of the Emperor Meiji. According to this law, the Japanese Throne "shall be succeeded to by male descendants in the male line of Imperial Ancestors" (Art. 1). In the history of Japan there were some Empresses in their own right, but their cases were always regarded as exceptional. The succession to the Throne as defined by the Imperial House Law is as follows:

(1) Imperial eldest son. (Kotaishi)
(2) Imperial eldest grandson. (Kotaison)
(3) Other male descendants of eldest son.
(4) Imperial son next in age.
(5) Male descendants of same in the same order as above.
(6) Other Imperial sons in order of age.
(7) Male descendants of same in the same order as above.
(8) Imperial brothers in order of age and their male descendants in the same order as shown above.
(9) Imperial uncles and their male descendants in the same order as above.
(10) Next nearest relative of the Emperor.

In all cases precedence is given to descendants of full blood over those of half blood.

The Three Sacred Treasures The Imperial heir ascends the Throne and is invested with the three Sacred Treasures, the Mirror, the Jewel, and the Sword, of the Imperial Ancestors upon the demise of the Emperor, and in no other circumstances. In ancient days, the Throne was succeeded to only for this natural reason, but the good custom was broken in the middle ages. The Imperial House Law aims at the re-establishment of the oldest custom and absolutely prohibits the abdication of the Throne in the Emperor's life time. The Imperial heir ascends to the Throne immediately upon the demise of the Emperor, although the ceremonial ascension comes later. For instance, the present Emperor came to the Throne in a room of the Hayama Winter Palace, where his father died, immediately after the demise was announced by the doctor on December 25, 1926, while the formal ceremony of accession was held about two years later in accordance with Art. 11 of the Imperial House Law which states that the ceremonies of Enthronement shall be performed and a Grand Enthronement Banquet (Daijosai) in honour of the Ancestral Gods held at Kyoto. Upon the accession, a new era is inaugurated and the name of the era remains unchanged during the whole reign of the Emperor.

The Regency As abdication of the Throne is impossible, Art. 19 of the Law provides for a regency to be instituted when the Emperor is a minor (the Tenno, Kotaishi and Kotaison attain majority at 18 years of age), or when he is prevented by some permanent cause from personally governing. In the second case the advice of the Imperial Family Council and of the Privy Council is required. The Regency shall be assumed by major members of the Imperial Family in the following order:

Family Status	Majority Age
(1) The Imperial Eldest Son	18
(2) Imperial Eldest Grandson	,,
(3) Imperial Prince	20
(4) Prince	,,
(5) The Empress	,,
(6) The Empress Dowager	,,
(7) The Grand Empress Dowager	,,
(8) Imperial Princess or Princess	,,

Imperial Prerogative

According to the provisions of the Constitution, the Japanese Emperor is the head of the Empire, combining in himself all the rights of sovereignty. According to the provisions of the Imperial House Law, he is the head of the Imperial Family, and he carries out his function as such by the advice of the Minister of the Imperial Household without reference to the Diet. By hereditary custom he assumes the position of the Highest Priest of the national cult of Shinto and conducts august ceremonies in honour of the gods of heaven and earth and of the ancestral gods directly and in person. He is in supreme command of the Imperial Army and Navy and exercises this power with the help of special organs established to that end and independently of the advice of State ministers. Lastly, he has power to confer all titles of nobility, rank, orders and other marks of honour.

The Emperor uses these sovereign powers with the assistance of various organs. In exercising legislative power he gets the consent of the Imperial Diet as a rule, although Imperial ordinances are often issued independent of the Diet, (under Article 9 of the Constitution), and for the colonies the exercise of ordinance power is unlimited

Digitized by Google

by the Constitution. In the administration of State affairs he is advised by the Ministers of State, and in certain special cases by the Genro, the Grand Keeper of the Imperial Seals, and the Privy Council. In Military administration he is advised by the chiefs of the Naval and Military General Staffs, while in the exercise of judicial power, he is represented by the Courts of Law.

"The Emperor is sacred and inviolable" (Constitution, Art. 3). He cannot be removed from the Throne for any reason; and he is not to be held responsible for over-stepping the limitations of law in the exercise of his sovereignty. All responsibility for the exercise of his sovereignty must be assumed by the Ministers of State and other organs. Thus, no criticism can be directed against the Emperor, but only against the instruments of his sovereignty. Laws are not to be applied to the Emperor as a principle, especially criminal laws, for no court of law can try the Emperor himself and he is not subject to any law.

The Cabinet

The Cabinet is composed of 14 State ministers headed by the Prime Minister. The 13 ministers are (1) the Minister for Foreign Affairs, (2) the Minister for Home Affairs, (3) the Minister of Finance, (4) the Minister of War, (5) the Minister of Marine, (6) the Minister of Justice, (7) the Minister of Education, (8) the Minister of Agriculture and Forestry, (9) the Minister of Commerce and Industry, (10) the Minister of Communications, (11) the Minister of Railways, (12) the Minister for Overseas Affairs and (13) the Minister of Welfare (The "Kōsei Shō", or the Department of Welfare, was established in January, 1938).

Though all the ministers are separately responsible to the Emperor for all the administrative work under their respective jurisdiction, they are united by the Prime Minister (Naikaku Sori Daijin), one of whose functions is to preserve unity among the State ministers. Through this specific function of the Premier (which, though not mentioned in the Constitution, is prescribed in the Cabinet Organization Ordinance), and the rapid growth of party government, his controlling power over the other State ministers has, of late, been greatly augmented, and as all matters of national importance are decided upon in cabinet meetings, State ministers are now, as a matter of fact, held jointly responsible to the Emperor.

Thus, each departmental minister has a twofold function, first as a State minister and secondly as a departmental executive head. As a State minister he is an adviser to the Emperor in the exercise of his sovereign power over national administration, and for the advice given assumes a joint responsibility with his colleagues. As the head of a department his function is to direct, control and supervise all the administrative affairs within his departmental jurisdiction, for which his responsibility is individual.

As it is imformed in the chapter on parties and politics the Hirota Cabinet resigned early in February, 1937, and was succeeded by the Hayashi Cabinet which assumed position for but four months followed by the Konoé Cabinet which was formed on June 4, 1937. This was succeeded by the present Hiranuma Cabinet which was formed on January 5, 1939. The names and careers of members of the cabinet are given below.

The Members of the Hiranuma Cabinet (April, 1939) Prime Minister, Baron Kiichiro Hiranuma, D.L., born in September, 1867; graduated from the Law Department, Tokyo Imperial University, 1888; entered service at the Justice Ministry, 1888; judge at various courts and later public procurator at the Tokyo Court of Appeal and concurrently the chief of the civil and criminal bureau, Justice Ministry; sent to Europe and America for the study of the judicial system, 1907; Doctor of Law, 1907; Vice-Minister of Justice, 1911; Procurator-General, 1912-21; President of the Supreme Court, 1921-23; Minister of Justice, 1923; Privy Councillor, 1923; Vice-President of the Privy Council, 1926; Baron, 1926; President of the Privy Council, 1936-39.

Minister without Portfolio, Prince Fumimaro Konoé, President of the Privy Council. (See the Japan Year Book, 1938-39, p. 99.)

suspension of an administrative operation or of the application of an administrative order by any executive organ, pending the final decision of the Emperor. The Premier issues Cabinet Orders in virtue of this official function or by special commission. He is empowered within his functional jurisdiction to direct the Metropolitan Chief of Police and the Prefectural Governors. Matters that should be presented to the Cabinet Council are prescribed as follows:

(1) All legislative and budget bills.
(2) Treaties and other international matters of importance.
(3) Ordinances to be issued.
(4) Disputes among the various Departments regarding jurisdiction.
(5) Petitions from the people received from the Emperor or from the Diet.
(6) Outlays not prescribed in the budget.
(7) Appointments and removals of officials of "chokunin" rank and also of prefectural governors.

Cabinet Advisory Council

The Imperial Ordinance No. 593, promulgated on October 14, 1937, established an extraordinary system of Cabinet Advisory Council. The Councillors are chosen from among experienced political, military and businessmen, and are to give advices to the Premier and the Cabinet on important national policies pertaining to the present national and international situations.

The first Councillors were: General Kazushigé Ugaki; Mr. Chuji Machida, President of the Minseito; Admiral Kiyokazu Abo; General Sadao Araki; Admiral Nobumasa Suétsugu; Mr. Yonezo Maéda of the Seiyukai; Mr. Kiyoshi Akita of the Seiyukai; Mr. Yosuké Matsuoka, President of the S. M. R.; Baron Seinosuké Goh, former President of Nippon and Tokyo Chambers of Commerce and Industry; and Mr. Seihin Ikéda, former Governor of the Bank of Japan and President of the Mitsui Bank.

The present (April, 1939) members are Mr. Chuji Machida, Admiral Kiyokazu Abo, Admiral Nobumasa Suetsugu, Mr. Kiyoshi Akita, Mr. Yosuké Matsuoka, Baron Seinosuké Goh, Mr. Seihin Ikeda, General Iwane Matsui, Mr. Sonyu Ohtani, and Mr. Toshio Shimada.

Cabinet Bureaux

Important offices of the Cabinet are the Secretariat, Pension Bureau, Statistics Bureau, and Printing Bureau. There are three other bureaux which are affiliated to the Cabinet and which are under the Premier's direct control, namely the Legislation Bureau, Merit Bureau and Board of Planning. All bills to be submitted to the legislature by the Government and all ordinances to be promulgated are drafted at the Legislation Bureau in accordance with the order of the Premier. Proposals of amendment or repeal of laws or ordinances are also submitted to this bureau. In the discharge of his duties the Chief of the Legislation Bureau is at liberty to present his opinion to the Cabinet.

The Merit Bureau handles all business pertaining to the Orders of Merit, decorations and the pensions affiliated to them, national and international. The

Digitized by Google

Board of Planning was established in October, 1937, in the place of the former Bureau of Planning and the Resources Bureau. The function of the Board are to make recommendations to the Prime Minister in regard to important national policies and to their co-ordination and adjustment, to investigate the important policies proposed by Ministers and make recommendations based on due observation of them, to make recommendations concerning control over budget estimates, and to make plans for the control and unification of Departmental businesses for carrying out the national mobilization scheme.

On December 26, 1934, the Bureau for Manchurian Affairs was established. The bureau is under the Premier's direct control as are the other three bureaux. Its function is to supervise all matters concerning Kwantung Leased Territory and the South Manchuria Railway Zone through the Kwanto Bureau in the Japanese Embassy in Hsinking.

Two bureaus were established in 1937, the Tohoku Kyoku (Bureau for the North-Eastern Districts) and the Cabinet Bureau of Information.

The China Affairs Board was created, in December, 1938, as the central office for carrying on works pertaining to the rehabilitation and development of China.

There are many committees under the direct control of the Premier, important ones being as follows :—(a) The Higher Civil Service Examination Committee which is in charge of the higher civil service examinations, and of recommendations to certain higher posts. It consists of 8 members who are chosen from among high officials of the Government and its chairman is the Premier, (b) the Pensions Arbitration Committee, (c) The Resource Investigation Committee, (d) The Merit Examination Committee, (e) The Welfare Promotion Committee for the North-Eastern Districts, (f) The Committee for the Celebration of the 26th Centenary of the founding of the Empire, (g) The Election System Investigation Committee organized in July, 1936, and (h) the Diet Organization Investigation Committee instituted in July, 1936.

The Executive Departments

Department of Foreign Affairs. The Minister for Foreign Affairs administers all the diplomatic affairs of the Empire ; organizes the protection of the Empire's commercial interests and Japanese subjects resident in foreign countries ; and directs and supervises Japanese diplomats and consuls. The Department of Foreign Affairs is subdivided into five bureaux, namely, (1) East Asiatic, (2) European and Asiatic, (3) American, (4) Commercial, and (5) Treaties.

The East Asiatic Bureau is divided into three sections : the First Section handles diplomatic matters related to China, Hong-Kong and Macao ; the Second Section those concerning Siam and protection and control of Japanese residents in those countries ; and the Third Section those concerning Manchoukuo.

The European and Asiatic Bureau is divided into two sections : the First Section handles diplomatic matters related to the U.S.S.R., Finland, Estonia, Latvia, Lithuania, Turkey, Poland, Persia and Afghanistan ; the Second Section those of all the European and other countries not coming under the control of any other bureau or section.

The American Bureau is divided into three sections : the First Section handles diplomatic matters concerning Canada, the United States of America and her territories ; the Second Section, the Central and South American countries ; the Third Section handles matters concerning emigrants and passports.

The Commercial Bureau is divided into three sections : the First Section handles matters concerning institutions and policies of trade and navigation ; the Second Section control, promotion and protection of trade and navigation ; the Third Section commercial affairs and reports.

The Bureau of Treaties is divided into three sections : the First Section handles matters concerning drafting, interpretation, sanction, publication and revision of treaties with foreign countries ; the Second Section international judicial matters ; the Third Section the League of Nations.

There are three other offices of importance. The Information Bureau is divided into three sections. The First Section handles matters concerning news in daily papers and broadcasting ; the Second Section books, magazines, publication, foreign news agencies, propaganda, international meetings ; the Third Section distribution of diplomatic knowledge.

The Investigation Bureau is divided into five sections and their duties are as follows : the First Section general business and study of diplomatic facts ; the Second Section keeping of records and materials ; the Third Section investigations on diplomatic and commercial situations in Asia and the Near

Digitized by Google

East; the Fourth Section investigations on Europe and Oceania; the Fifth Section political and diplomatic investigations on North and South American countries.

The Cultural Works Bureau handles matters concerning the cultural works for China which mainly consist of promotion and assistance of cultural investigations and enterprises on China.

Japanese Embassies, etc. (See Chapter VI, List of Envoys.)

Department of Home Affairs The Minister for Home Affairs is in charge of national shrines, prefectural administration, national and local political elections, police, public undertakings, town planning, publication and copyrights, etc. It is also his function to supervise the Chief of the Metropolitan Police Board and the prefectural governors. The Ministry of Home Affairs has in recent years become the most important Government office politically, inasmuch as it supervises elections and administers local public works. The Minister is assisted by a parliamentary vice-minister, a vice-minister and a counsellor. The department has five bureaux, respectively in charge of the following affairs:—(1) Shrines, (2) Local Affairs, (3) Public Order, (4) Public Works, and (5) Planning.

The Bureau of Local Affairs has a vast field to supervise. It has to be in close touch with (1) all matters affecting elections, (2) all the work concerning local public associations and other general administration, (3) financial and economic matters of various local public associations, (4) all matters concerning conscription and requisition to be executed by the prefectural governments, (5) all matters concerning forests, reclamation and settlement in Hokkaido and other matters in Hokkaido which do not come within the scope of any other bureaux.

The Bureau of Public Order is invested with the highest authority over ordinary as well as political police matters, and the publication of books and other printed matter.

The Bureau of Public Works is in charge of all public undertakings, not only those under the direct control of the Home Department but also those of all the prefectural governments. All matters regarding expenditure for public works of all sorts directly undertaken by the Department of Home Affairs and the subsidies to be granted for prefectural public works are handled by this Bureau.

The Bureau of Planning makes plans for the improvement of cities and some 400 municipalities and for the air defence of all districts.

The following institutions also come under the control of the Minister for Home Affairs:— the Asylum for Disabled Soldiers, the National Shrines Building Office, the Police Educational Institute, the National House of Correction for the Improvement of Juvenile Criminals, and the National Leper-Houses.

The Department of Finance The Minister of Finance is in charge of accounting, payments and receipts of public money, taxation, government bonds, coins, money in deposit and custody, negotiable instruments owned by or in custody of the Government and all matters concerning banking, trust business, "ko" (an oriental mutual loan association), and sale of negotiable instruments. He also supervises the finances of the prefectural governments and other local public bodies.

The Finance Department has the following four bureaux:— (1) The Accounts Bureau, which handles all matters concerning the national budget and settlement of accounts, special accounts, co-ordination of treasury business, control of accounting officials, etc. (2) The Bureau of Taxation, which handles matters pertaining to the levying of national taxes, supervision of taxation affairs, the land register, and customs and excise tariffs. (3) The Bureau of Fund Employment, which is in charge of matters concerning the employment of national funds, the administration of national treasury money, the coinage, general circulation of money, national loans, accident and relief funds, deposits and negotiable securities, annuities, and public loans floated by public associations. (4) The Banking Bureau, which takes charge of matters concerning special, ordinary and savings banks, other matters pertaining to banks, the central chest of co-operative societies and credit unions in the cities.

The following other bureaux and institutions are attached to the Department of Finance and are under the direct jurisdiction of the Minister:— (1) The Deposits Bureau, which handles a huge amount of deposits from the middle and lower classes of the people, special importance being always attached to the question of how to utilize this money, (2) The Foreign Exchange Control Bureau, (3) The National Property Bureau, which is in charge of all national properties, and makes arrangements for their disposal or acquirement. (4) The Mint Bureau, located in Osaka, which is in charge of the minting and melting down of all coins, the casting

Digitized by Google

of national medals or decorations, and laboratory work on metals. (5) The Customs Bureaux, which not only handle matters concerning the collection of import duties but also take charge of the control of ships going in and out of the trade ports, medical and health examination of passengers and crews, plants and animals, and registration of epidemics in accordance with the epidemics or tuberculosis prevention laws for men and animals. Customs Houses under these Bureaux are located at the seven trade ports, namely, Yokohama, Kobé, Osaka, Nagasaki, Moji, Nagoya and Hakodaté. (6) The Revenue Superintending Bureaux, which handle matters concerning tax collection. (7) The Monopoly Bureau, which administers the four government monopolies, salt, camphor, tobacco, and pure alcohol (newly included in 1937).

One laboratory and several committees are under the direct control of the Minister of Finance, namely, the Brewing Laboratory and the Committees on Tariff Petitions Examination, the National Property Survey, Building Central Offices of the Government, Tariff Investigation, etc.

The Department of War The function of the Minister of War, who is appointed from among Generals or Lieutenant-Generals in active service, is to direct the military administration. He controls all the men enlisted in the Army and supervises all branches of the Army. Though the War Minister is assisted by a parliamentary vice-minister and a counsellor they have nothing to do officially with military secrets and military orders (for the organization of the Department and its detailed functions, see Chapter VII).

The Department of Marine The Minister of Marine is appointed from among Admirals or Vice-Admirals in active service and is responsible for all naval administration. He controls all the men enlisted in the Navy and supervises all branches of the Navy. The parliamentary vice-minister and counsellor have nothing to do with naval secrets and naval commands (for the organization of the Department and its detailed functions, see Chapter VII).

The Department of Justice The Minister of Justice supervises courts and procurators' offices; and controls all judicial proceedings. The Department contains three bureaux, dealing respectively with civil affairs, criminal affairs, and prisons.

Judicial procedure is divided into three instances. The courts of first instance are the Local and District Courts. In the Local Court are tried civil cases of minor importance and those involving sums not exceeding one thousand yen. The Court also deals with criminal cases which are not felonies and those which do not require preliminary examination. The Local Court handles cases of bankruptcy and those concerning personal status and arbitration. In rent and commercial disagreements, an arbitration committee, composed of one judge and two laymen experienced in the matters involved in the dispute, may be appointed. The jurisdiction of a Local Court covers an average area of 2,587 square miles and a population of about 219,000.

The District Court conducts trials of first instance of cases beyond the jurisdiction of the Local Court and preliminary examinations of criminal cases of a complicated character.

The District and Appeal Courts are the courts of second instance. The former handles cases on appeal from the Local Courts, and the latter appeals against the first instance decisions of the District Courts.

The court of third instance is the Supreme Court, which tries all civil and criminal cases which are brought before it, and conducts preliminary trials for (1) serious offences against the Imperial House, (2) high treason, and (3) offences committed by members of the Imperial Family.

There are one Supreme Court, 7 Courts of Appeal, 52 District Courts and 282 Local Courts in Japan proper.

Attached to each of these courts is a procurators' office, its functions being to conduct investigations, institute prosecutions, supervise the execution of sentences in criminal cases, and act as representative of the public interest in civil cases (For further details, see Chapter XXVII).

The Department of Education All matters relating to education, art, science, literature, and religion are under the direction and supervision of the Minister of Education. There are seven bureaux and one division in the Department, i. e. (1) Bureau of College Education, (2) Bureau of Common Education, (3) Bureau of Technical Education, (4) Bureau of Social Education, (5) Bureau of Books, (6) Bureau of Religion, and (7) Bureau of Thoughts.

Six imperial universities, 2 commercial universities, 7 medical universities, 1 technical university, 2 normal universities, 4 higher normal schools, and 79 colleges and special educational institutions come under the direct administration of the Department (see Chapter

Digitized by Google

XXVIII).

The following institutions are also established and controlled by this Department:—the Imperial Library; the Tokyo Observatory; the Central Meteorological Observatory; the Marine Meteorological Observatory; the Aerological Observatory; the Latitude Observatory; Epidemic Laboratory; Aeronautical Laboratory; Seismological Laboratory; Hot Spring Cure Laboratory; the Tokyo Science Museum; the Physical Education Laboratory; the Navigation Institute; the Geodesy Committee; the Examining Committee for Teachers' Licences; the Physical Sciences Literature Committee, for preparing a national list of books on physical sciences, as a branch of the International Committee for the same purpose; the Imperial Academy, which is composed of one hundred scholars appointed by the Emperor and is established for the promotion of science and culture; the Imperial Academy of Arts, which is composed of less than 80 members under a president, for the progress of fine art, literature and music; the Text Book Committee; the Science Council; the National Language Committee; the Aeronautics Council; the School Hygiene Committee; the Earthquake Disaster Prevention Committee; the Religious System Investigation Committee; and the National Treasure Preservation Committee.

The Department of Commerce and Industry The Minister of Commerce and Industry is assisted in administration of the Department by a parliamentary vice-minister, vice-minister and counsellor.

There are eight bureaux in this Department, dealing respectively with commerce, industry, mining, foreign trade, insurance, control (rationalization of commerce and industry), fuel and patents. Examination and control of weights and measures is under the Central Weights and Measures Office. Other affiliated office of importance is the Mine Supervision Bureau.

In May, 1932, an ordinance was issued empowering the Minister of Commerce and Industry to establish two industrial laboratories, in Tokyo and Osaka respectively. These laboratories are opened for the examination, analysis, and appraising of industrial commodities for the benefit of interested parties. Other institutions under the Department are as follows: the Fancy Mat conditioning Houses, the Silk Experimental Stations, the Earthenware and Porcelain Experimental House, the Silk Goods Export Conditioning House, the Industrial Advice and Information Office, the Fuel Laboratory, the Industrial Art Examination Committee, the Unreasonable Low Price Investigation Committee, the Gas Business Committee, the National Products Promotion Committee and the Motor-car Manufacturing Business Committee.

The Department of Agriculture and Forestry The Minister of Agriculture and Forestry controls all matters concerning agriculture, forestry, marine industry, stock-breeding and the enforcement of the Rice and Cereals Law. The Department is divided into the following seven bureaux:—(1) The Agriculture Bureau, which takes charge of matters concerning agriculture, tea production, subsidiary industries among farmers, industrial unions, the central chest of the co-operative associations, and the enforcement of Cereals Law. (2) The Forestry Bureau, which deals with all matters concerning forests and meadows. (3) The Fisheries Bureau. (4) The Stock Breeding Bureau, which deals with the improvement and breeding of domestic animals, their hygiene, insurance and hunting. (5) The Silk Bureau handles matters concerning sericulture and the silk industry. (6) The Horse Bureau, which was established in July, 1936, deals with improvement, breeding and other matters concerning horses and their pastures; and (7) The Rice Bureau for control of price of rice and its supply.

The following institutions are under the direct control of the Minister:—the Agricultural, Horticultural, Tea and Forestry Experimental Stations, the Fisheries Institute and Fisheries Experimental Stations, the National Stock-sheep Pastures, the Animal Disease Examination Institute, the National Bull Pastures, National Poultry Station, the Sericultural Laboratory, the Raw Silk Conditioning Houses, the Tea Experimental Houses, the Rice and Cereals Committee, and the Silk Price Committee.

The Department of Communications The Minister of Communications administers the State post, telegraph, telephone, broadcasting and beacon services, and is in charge of all matters relating to electricity, hydraulic power and aviation. All business enterprises of electricity, ship-building, and water transportation together with navigation routes, ships and seamen are under his supervision. He also directs the operations of the Nippon Wireless Telegraph Company.

The Minister is assisted by a parliamentary vice-minister, and a counsellor.

Digitized by Google

The Secretariat, beside the ordinary secretarial work, supervises the training of clerks who are expected to enter the communications service and all matters concerning communications exhibitions. There are seven main bureaux in the Department :—Postal Service Bureau ; Telegraph and Telephone Service Bureau ; Bureau of Engineering ; Bureau of Electricity ; Bureau of Mercantile Ships ; Aviation Bureau ; and Bureau of Accounts and Supplies.

There are in addition the following affiliated offices :—Bureau of Savings, Lighthouse Bureau, and Communications Bureau. The Savings Bureau handles matters concerning the Post Office savings, and their transfer to the national deposit.

The following institutions are under the direct supervision of the Minister : —the Electro-Technical Laboratory, the Marine Court of Inquiry, the Marine Labour Exchange Committee, the Post-Office Life Insurance Investigation Committee, the Post-Office Life Insurance Reserve Fund Utilization Committee, the Electricity Committee and the Aviation Control Committee.

The Department of Railways The Minister of Railways administers all the affairs relating to the railways operated by the Government and supervises the operations on land of all private railway companies. The Department is divided into seven bureaux, namely, Bureau of Local Railway Administration, Bureau of Traffic and Operation, Bureau of Construction, Bureau of Mechanical Engineering, Bureau of Maintenance and Improvement, Bureau of Electricity, and Bureau of Finance and Purchasing. During the last few years there has been operated a special Tourist Industry Bureau for attracting foreign tourists, which is subdivided into the Controlling and Investigating Section and the Promoting Section. The administrative work of the state railways is apportioned to six local regions : Tokyo, Nagoya, Osaka, Moji, Sendai and Sapporo. Each region is in charge of a director who has full powers to conduct all but the most important affairs within his jurisdiction.

There are three committees affiliated to the ministry, the Railway Council, the Tourists Committee and the Railway Fare Investigation Committee. (See Chapter XXV, State Railways.)

The Department of Overseas Affairs The Minister of Overseas Affairs supervises the administrative work of the Chosen Government-General, the Taiwan Government-General, the Kwantung Government, the Karafuto Government, and the Government of the South Sea Islands. He also supervises the business operations of the South Manchuria Railway Company and the Oriental Development Company. He directs all matters concerning emigration excepting those of a diplomatic nature. For the performance of these duties,the Minister is empowered to direct and supervise consuls stationed in foreign countries in consultation with the Foreign Minister. There are, besides the Secretariat, the following four offices in the Department ; the Chosen Office, (having a special status and being always under the direction of the vice-minister), Industry Development Bureau, the Supervision Bureau, and the Exploitation Bureau.

The Department of Welfare The Minister of Welfare administers all the matters relating to the health and well-being of the people. The Department is divided into five bureaux of Physical Strength, Public Hygiene, Disease Prevention, Social Affairs and Labour, which are responsible for matters relating to national health, social welfare and labour, and a Board of Insurance which is responsible for matters relating to health insurance, accident relief liability insurance for labourers, and other systems of social insurance as well as post office life insurance and post office life annuities. The following is the list of matters coming under the jurisdiction of the Department, classified according to the Bureaus and the Board: (1) Bureau of Physical Strength; matters concerning planning for the improvement of physical strength, matters concerning measures and institutions for the improvement of physical strength, matters concerning investigations of physical strength, matters concerning physical education and sports, matters concerning infant's, children's and maternity hygiene. (2) Bureau of Public Hygiene ; matters concerning sanitation in food, clothing and dwelling places, matters concerning hygienic guidance, matters concerning medical and pharmaceutical affairs, other matters relating to public health which do not come under the supervision of other governmental institutions. (3) Bureau of Disease Prevention ; matters concerning the prevention of infectious, local and other diseases, matters concerning quarantine, matters concerning mental diseases, matters concerning the hygiene in connection with venereal and other diseases detrimental to survival of the race. (4) Bureau of Social Affairs ; matters concerning social welfare measures and institutions, matters concerning relief and free medical

Digitized by Google

treatment, matters concerning military relief, matters concerning the protection of mothers, infants and children, matters relating to other social welfare works, matters concerning employment exchange and supply and demand of labour. (5) Bureau of Labour; matters concerning labour conditions, matters concerning labour hygiene in factories and mines, matters concerning the general control of affairs in connection with the International Labour Organization, other matters relating to labour. (6) Board of Insurance; (a) Section of General Affairs, matters concerning personnel, documents and accounts, matters concerning actuarial work, matters concerning the planning of social insurance and post office life insurance systems and the planning and general control of hygienic measures for the insured, similar matters not coming under the jurisdiction of other governmental institutions, (b) Section of Social Insurance, matters concerning health insurance, accident relief liability insurance for labourers and other systems of social insurance, (c) Section of Post Office Life Insurance, matters concerning post office life insurance and annuities.

The Privy Council

The Privy Council is a consultative body to advise the Emperor on questions of grave importance. The Council is composed of one President, one Vice-President (non-voting) and 24 Councillors. All the Councillors are officials of shinnin (highest) rank. All these members are appointed by the Emperor on the advice of the Prime Minister. Cabinet Ministers are entitled by virtue of their office to sit in the Privy Council as councillors and have the right to vote. Princes of the Blood who have attained their majority and are resident in Tokyo can sit in the Council under the same conditions.

The questions that are to be submitted to the Privy Council for deliberation cover :

(1) All matters that fall within its jurisdiction according to the provisions of the Imperial House Law.

(2) All matters concerning interpretation of the provisions of the Constitution and laws and ordinances supplementary thereto.

(3) Proclamation of Martial Law under Article 14 of the Constitution, Imperial ordinances under Article 8 and Article 70, and any other Imperial ordinance which has a disciplinary clause.

(4) Treaties and all other international pledges.

(5) All matters involving an amendment in the organization and procedure regulations of the Privy Council.

(6) Other matters submitted to the Council by the Emperor.

Though the Privy Council is thus the highest consultative organ of the Emperor in important matters of State, it has nothing to do with the actual government administration.

Ministers Outside the Cabinet

There are two important offices of a quasi-administrative character of which the holders are styled "Daijin" (Minister). These "Ministers" are not members of the Cabinet and do not change with the Government.

The Office of the Grand Keeper of the Imperial Seals is generally regarded as the senior of these offices. Its holder has the duty of keeping the Imperial Seal and the Seal of State, and of supervising secretarial work in connection with Imperial Edicts and Rescripts and other documents of the Imperial Court. The other office is that of Minister of the Imperial Household Department. The Minister is in charge of all business concerning the Imperial Household. (Consult the chapter on Imperial Court for fuller information as to their duties.)

The Board of Audit

The Board of Audit is provided for by Article 72 of the Constitution and is on an equal footing with the Ministers of State. It is composed of a president, three divisional chiefs and 12 inspectors, who are appointed by the Emperor on the advice of the Prime Minister, but cannot be dismissed, transferred or placed on the retired list except by effect of either a criminal or a disciplinary trial.

The function of the Board is to audit accounts of the central government and other corporate bodies, public or private, receiving government subsidies or guarantees.

The Court of Administrative Litigation

The law of 1890 which established this Court is envisaged in Article 61 of the Constitution. The Court is entirely distinct from ordinary judicial courts and its function is to decide on the validity of administrative acts. The Court is not interfered with by the Government. According to the law the Court of Administrative Litigation is to be located in Tokyo and no local court established. It is composed of a President and 11 Counsellors. Its members are appointed by the Emperor on the advice of the

Digitized by Google

Prime Minister and are not to be removed, suspended from office or deprived of position, without their consent. This is exactly the same as with ordinary judges (see Chapter XXVII), but the differences are that the former's position is not for life, while the latter's is and that there is no institution of the retiring age for the former. The present head of the Court is Dr. Hyoji Futakami.

The Court passes on cases relating to (1) the levying of taxes and fees except the customs tariff; (2) dispositions for the recovery of taxes in arrears, (3) the prohibition or suspension of business, (4) water-ways and public works, and (5) fixing the boundary between the Government and private owned lands.

An appeal is immediately taken by the Court and the decision on it is given by a majority vote of the council of more than 5. The decision is the first, and at the same time, final.

Government Officials

Civil officials are divided into four ranks according to their grade of merits, education and ability, and their salaries differ accordingly. The four ranks are: (1) Shinnin rank, appointed by His Majesty directly, (2) Chokunin rank, appointed by His Majesty's order indirectly, (3) Sonin rank, appointed by His Majesty's approval, and (4) Hannin rank of minor officials appointed by the heads of different offices.

At the end of 1937, civil officials who received salaries from the State Treasury numbered 159,877 in total, their salaries amounting to ¥190,788,126, of which officials of shinnin and chokunin rank numbered 1,786 with an aggregate salary of ¥9,088,915 a year, officials of sonin rank 16,194 with ¥42,048,598, and officials of hannin rank 141,811 with ¥110,764,448. The average salary of officials of chokunin rank was ¥5,089 a year, that of officials of sonin rank ¥2,596 and that of officials of hannin rank ¥781.

As to the number of officials of chokunin, sonin, and hannin ranks classified according to departments, the Department of Railways had the largest with 38,074, which was followed by 36,323 of the Department of Communications, 17,339 of the Government-General of Chosen and 15,228 of the Department of Finance. Departments other than those given above had less than 10,000 each, viz. the Department of Justice had 8,975, the Department of Education 8,186, the Government-General of Taiwan 6,921, the Department of Agriculture and Forestry 4,438, the Home Department 2,923, Department of War 2,806, Bureau of Kwantung Leased Territory 1,870, the Department of Commerce and Industry 1,590, the Department of Marine 1,898, the Government of Saghalien Island 1,395 and the Department of Foreign Affairs 1,183. Other Departments had less than 1,000 each. Among prefectural offices, Hokkaido Office had 1,430, Tokyo Metropolitan Police Office had 309, and all other prefectures together 9,232. Each prefectural government office had 200 on the average.

Number and total amount of salaries paid to civil officials of the Government in the past 10 years follow:

Year	Number	Salary
1928	128,792	¥156,572,037
1929	134,831	163,745,391
1930	126,995	160,265,485
1931	134,537	160,644,249
1932	130,988	157,688,618
1933	132,987	159,579,259
1934	135,692	163,333,026
1935	142,543	170,419,940
1936	148,984	176,848,499
1937	159,877	190,788,126

Note:—The number of the other employees was 328,110, the wages paid to them amounting to ¥179,197,235.

The Imperial Diet

The Parliamentary system could not develop in Japan before the Meiji Restoration because politics was controlled by the Samurai class for hundreds of years. Thus, the Imperial Diet was established solely according to the pattern of Western countries. In accordance with the promise contained in the Charter Oath of the Emperor Meiji, councils or assemblies of various kinds were established at the beginning of the Meiji Era, but their members were not elected by the people and consequently they were of a different nature from the parliaments of the West. In 1881 it was promised to convoke a National Assembly within 10 years, and the Imperial Diet on Western lines was first opened in 1890.

The Diet is much limited in its power and the duration of its sessions, but in its fundamental nature it has much in common with the national assemblies of Western countries. According to Art. 5 of the Constitution, the legislative power belongs to the Emperor and the Diet's function is only to give (or presumably withhold) consent to legislation proposed by the Throne. But this is a formality, and the Diet has almost the same power of legislation, including that

Digitized by Google

of initiative as the parliaments of other civilized nations. At the same time, the Diet, in virtue of its being an assembly of representatives, has been invested with the power of supervising the administrative organs, as represented by the State ministers. It is a bicameral legislature, consisting of the House of Peers and the House of Representatives, and the decisions which are harmoniously made by both Houses are the decisions of the Imperial Diet.

The House of Peers The House of Peers is composed of the Imperial Princes, Peers, and the Imperial nominees, according to the provisions of the House of Peers Ordinance. This Ordinance was promulgated at the same time as the Constitution and has been revised several times since. In 1925, important revisions were made, the number of the peerage members being lessened while that of the representatives of the wealthy people was increased, also there was an addition of representatives of the Imperial Academy. Thus the former majority of peerage members was brought to an end and their number became equal to that of members chosen by Imperial order.

According to the present House of Peers Ordinance, the House is composed of the following members :

(a) all the Imperial Princes above 20 years of age, and the Kotaishi and Kotaison, if above 18.

(b) all Princes and Marquises above 30 years of age, with the term of office for life.

(c) 18 Counts, 66 Viscounts and 66 Barons elected by the Peers of their respective ranks. They must be above 30 years of age and their term of office is 7 years.

(d) Imperial nominees from among statesmen and scholars who have made valuable contributions to politics or science. They must be above 30 years of age: their term of office is for life. Their number must not exceed 125.

(e) 4 members of the Imperial Academy, elected by the members thereof and nominated by the Emperor. Their term of office is 7 years.

(f) Members elected by and from among the highest tax-payers, in any prefecture, in direct national taxation on land, income and business profits. Each member represents 100 such high tax-payers, his age must be above 30, and his term of service is 7 years. The number of this class of members must not exceed 66.

The House of Peers, therefore, consists of 150 Counts, Viscounts, and Barons, 195 representatives of statesmen, scholars and wealthy businessmen, and a certain number of Imperial Princes, Princes and Marquises, the number of the last named not being fixed for obvious reasons. The present (December 24, 1938) total of the members of the House of Peers was 413.

The House of Representatives The House of Representatives is composed of members elected by the people in accordance with the provisions of the Electoral Law. This Law was first promulgated simultaneously with the enactment of the Constitution in 1886, and has undergone many minor revisions since. Important revisions were made in 1900, 1919 and 1925. The Law of 1889 required yearly payment of direct national tax of ¥15 as a qualification for both candidates and voters, and prescribed the system of small constituencies and the open ballot. In 1900, the requirement of tax payment was removed in the case of candidates and lowered to 10 yen voters. Constituencies were divided into two classes municipal and rural, making each city an independent district and each prefecture one district; and the secret ballot was adopted. In 1919, the tax requirement was again lowered to 3 yen and the old small constituency system revived. In 1925, the male universal suffrage system was finally adopted, the division of municipal and rural districts was abolished, and a system of constituencies electing from 3 to 5 representatives each was established.

The universal suffrage of Japan is restricted as yet in comparison with that of Western countries, as to sex, age, residence and the conditions of eligibility. Women are totally ineligible and the age qualification for male voters is 25. The Electoral Law itself says nothing of the restriction on residence, but the list of voters must be made by Sept. 15 of the year previous to that of the general election and only persons who have lived a minimum period of one year in the same city, town or commune are eligible for inclusion. The Law also contains provisions for withholding the right to vote from criminals, legally disabled persons, such as bankrupts, etc., actual holders of a peerage, persons engaged in the active combative services.

Candidates must be 30 years of age; otherwise their qualifications are the same as those for voters, except that of residence. The number of the members of the House of Representatives was 460, vacancies 6, on December 24, 1938.

According to the relevant articles of the Constitution, the Diet has power over all affairs of state which belong to the responsibility of the State Ministers.

Digitized by Google

There is, however, a working but not complete separation of the legislative and executive powers between the Diet and the Ministers. There are certain statutory limitations of the Diet's power to control the executive. The Imperial Diet must not interfere with matters pertaining to the Imperial House. Except in regard to matters within the Diet itself, it can neither use the power of administration directly upon the people nor represent the State vis-à-vis foreign nations.

Fixed Number of Lower House Representatives and Number of Votes at Recent General Elections

Date of Election	Representatives	Voters
March, 1904	379	757,788
May, 1908	379	1,582,676
May, 1912	381	1,503,650
March, 1915	381	1,546,341
April, 1917	381	1,422,118
May, 1920	464	3,069,787
May, 1924	464	3,288,368
Feb., 1928	466	12,409,078
Feb., 1930	466	12,813,192
Feb., 1932	466	13,095,621
Feb., 1936	466	14,479,553
April, 1937	466	13,938,456

Function of the Diet The Diet has five functions, namely, constituent, legislative, financial, general supervision of the administration, and executive on matters in the Diet itself.

(1) The constituent power of the Diet is confined to deliberation on constitutional amendment initiated by the Throne. Action can only be taken by a two-thirds majority of a quorum of two-thirds of the membership of both Houses, as provided for in Article 73 of the Constitution.

(2) The Emperor exercises the legislative power with the consent of the Imperial Diet, all laws and legislative ordinances must obtain that consent. Bills may be presented by the Diet itself as well as by the Government. The right of consent of course contains the rights of amendment and rejection. This right is subject only to the condition that the Diet's action does not contravene the Constitution, the Imperial House Law, and international law. Thus the power of legislative "consent" contains within it that of initiative. Legislative ordinances promulgated by the Emperor must be submitted to the Diet at the next session for approval or rejection but not amendment.

The legislative authority of the two Houses is equal in theory, and projects of law may be initiated in either. Naturally, therefore, no legislative enactment is complete without the consent of both Houses to all its provisions.

(3) The national budget must get the consent of the Diet. The budget is presented by the Government first to the Houses of Representatives, but consent to it must be accorded by both Houses. Article 70 of the Constitution, however, empowers the Government to take all necessary financial measures by Imperial Ordinance, and Article 71 empowers it, if the Diet has not voted on the budget or if the budget "has not been brought into actual existence" to carry out the budget of the previous year. National loans must obtain the consent of the Diet. All contracts outside the budget which involve state financial liability must also be approved by the Diet. Any disbursement of public money by the Government made without the Diet's consent between sessions must be submitted for approval at the earliest opportunity. The restrictions of the Diet's financial power, other than those mentioned above, are clearly stipulated in Article 67 of the Constitution. It is to be noted that the Budget as a project of administrative action is confined to expenditure. Revenue is determined by law, so that the Diet's control thereof comes within its general legislative competence.

(4) The responsibility of Ministers, collective or individual, to the Diet is not clearly established either in law or custom, but so far as the responsibilities of Ministers are concerned, the Diet clearly has a certain supervisory power. The Government can do what it wishes without the consent of the Diet in its administrative function, but the Houses can express independently of each other their judgement on what the Government has done. They may present written appeals to the Emperor against the actions of State Ministers. They can make proposals by resolution to the Government concerning administration. They may receive petitions from the people (the only function of the Diet to keep a direct contact with the people), and if these concern administrative matters, they are handed to the Government with the opinion thereon of the Houses to which they were addressed. The Houses may also pass resolutions on important state matters which are not addressed to the Government directly, but which, being made public as they are, naturally have an effect on the Government's popularity if they contain adverse criticisms. In these

Digitized by Google

ways the Diet subjects the Government to a limited measure of control.

The Diet has the right of investigating the conduct of the administration, although this is very narrowly limited and rarely used. The Diet has the right of making inquiries on the responsibilities of the Ministers, the right of receiving reports from the Government on the income and disbursements of the National Treasury, on the handling of petitions sent in by the people through the Houses, and on serious diplomatic questions, unless they are such as require absolute secrecy.

(5) The Houses of the Diet have the right of self-government as to the regulations of their own Houses, on the procedures of session, on the police system in the Houses. The House of Peers has also the right to be consulted by the Emperor as to the privileges of peers.

The Diet is convoked annually by the Emperor (under Article 41 of the Constitution) for a period of ordinary session of 90 days. This period may be prolonged if necessary by Imperial Order. Extraordinary sessions can be convened in the same way. The annual session is usually called at the end of the year, although there is no regulation to this effect in the Constitution, and continued to the end of the following March, so that the budget can be voted before the new fiscal year begins. The Emperor may give orders to open or close the Diet; or suspend the session for a certain number of days for negotiations between the Diet and the Government or the two Houses; or dissolve the House of Representatives. All these actions are taken on the advice of the Prime Minister.

Officials of the Houses Each House has a President and Vice-President. The President not only presides and keeps order during the sessions but also directs the business of the House between sessions. The manner of appointment of the officers differs in the two Houses. In the House of Peers, they are appointed by the Emperor from among its members for a term of 7 years, the House itself having nothing to do with the appointment. In the House of Representatives, the House chooses three candidates for each of these positions and the Emperor makes the appointments from among the candidates. Their term of office is that of the life of the House.

There is an Official Bureau attached to each of the Houses, and officials such as the Chief Secretary, secretaries, stenographers, and the chief sergeant are appointed by the Government, although they act under the orders of the respective House Presidents. Several things in the Japanese parliamentary system have been copied from the British and this official bureau is one of them.

The House of Peers has five and the House of Representatives four standing committees, and special committees are appointed when the need arises. Each House may sit as a committee of the whole for which chairmen are elected at the beginning of the session. The procedure of discussions and resolutions is similar to that customary in the English-speaking countries.

Local Government

The units of local government are four: the prefecture, the city, the town, and the commune.

The Prefecture Japan proper, except Hokkaido, is administratively divided into 3 urban prefectures and 43 prefectures which are administered by governors. The function of the governor is to be the highest local administrative organ of state, and, at the same time, the head of the prefecture as a unit of local self-government. He is directly controlled by the Ministers of State and takes charge of the general national administration within his prefecture. In a prefecture all administrative business is unified under the control of the governor who supervises every kind of administrative work in the district according to the orders of the Premier and Ministers of the Central Government. Thus, the scope of his function is quite large and complicated. The appointment and dismissal of governors is made by the Minister of Home Affairs.

The system of prefectural government has undergone several changes and the nature of the work done is not necessarily the same in all the prefectures, but it is common, at present, to divide the duties into three divisions, namely, the Home Affairs Division, the Educational Division and the Police Division. Some prefectures have an Engineering Division.

As a unit of local self-government the prefecture stands between the state and the municipalities. It has a prefectural assembly and a prefectural council as organs for decision, but the right of decision of these organs is much narrower than that of the city assembly and council, while the chief executive is the governor who is officially appointed by the Central Government.

The prefectural Assembly is elected by universal suffrage, and the number of

Digitized by Google

members is fixed by the law. Membership of the assembly is honorary and the term of service is four years.

The Prefectural Council is composed of 10 members elected by and from among the assemblymen. The Governor is ex-officio chairman of the council, which is in fact a standing committee of the assembly, although entrusted with certain functions of arbitration which are not specifically devolved from the larger body.

Hokkaido is not divided into prefectural districts, but is itself an administrative unit as a whole, under a governor, although it covers an area of 88,775.04 square kilometres and is thus many times as large as most of the perfectures. The Governor is controlled by the Minister of Home Affairs directly and his function and duties are mostly the same as those of a prefectural governor. The special features of his function are that he undertakes colonization work, that as there is no national forestry law applied to the district the administration of forestry is left altogether in his power, and that he has to take care of the native Ainu according to the Protection Law for the Hokkaido Natives. The Hokkaido office is divided into five divisions, namely, Home Affairs, Education, Civil Engineering, Colonization and Police. The organization and rights of the Hokkaido Assembly and Council are almost the same as those of similar bodies in the prefectures. (On the governmental system of the Colonies see Chapters XL-XLIII.)

The Municipality (City, Town, Village) On April 1, 1937 there were 141 cities, 1,707 towns and 9,568 villages in Japan proper. (A village here means an administrative unit composed of a village or villages.)

There was some measure of local self-government in old Japan. The heads of villages were chosen from among the villagers and were asked to rule over them. For some time after the Meiji Restoration, these customs were continued, although the official names of the heads of villages were changed. Moreover, towns and villages were allowed to exercise the right of managing public affairs with their own money as financial units. But it was with the formation of prefectural assemblies according to the new laws issued in July, 1878, that the local self-government of Japan began to assume a modern form. The self-government system of cities, towns and communes has been several times revised, the last revision being that of 1929.

There were formerly several restrictions on citizenship of the local communities, but according to the laws now in force every man is entitled to it in virtue of the male universal suffrage principle. The requirements of citizenship are about the same as those for the right to vote in parliamentary elections. Every male inhabitant of and over 25 years of age who has resided for a minimum period of two years in the same municipality is a citizen of the same and has the right to vote or to be elected and, at the same time, has the duty of accepting any honorary post of service to which he may be elected.

The organs of local self-government are the assemblies of the representatives and the chiefs of the municipalities. The fixed minimum number of representatives in these assemblies is 30 in the cities and 12 in the towns and communes. The cities have also councils of ten members elected by and from among the assemblymen.

The Mayor of a city is a salaried official while the corresponding posts in a town or commune are honorary in principle. Mayors are elected by their respective assemblies for a term of four years. Their function and responsibilities are diverse, for they not only administer the affairs of the municipalities but also handle matters delegated to them by the central and prefectural governments and are entrusted with the supervision of some public bodies. As servants of the central government they take charge of the census register and all the business related to it, the election of the members of the Lower House, several kinds of national investigation, public engineering, public hygiene, relief work, educational supervision and encouragement, and certain work under the Conscription Law. This work is done without consulting the local assemblies, but simply as entrusted by the respective national officials.

CHAPTER V

PARTIES AND POLITICS

Pre-party Cabinet Period

Japan's modern political life fairly started with the promulgation of the Constitution on February 11, 1889, and the opening of the Diet on November 25, 1890. The Imperial Edict for opening the national assembly within ten years was issued (see Chapter III) on October 12, 1881.

Party Formation Upon the issuance of the Imperial Edict parties began to be formed with a view to be prepared for the opening of the Diet. On October 18, 1881, the colleagues and comrades of Taisuké Itagaki drafted the rules of the new Jiyu-to Party and elected Itagaki President and N. Nakajima Vice-President at a preparatory meeting which was held at Asakusa, Tokyo. The governing principle of this party was that of Rousseau's social contract.

The next great party to be organized was the Kaishin-to. It came into being in March, 1882, with Shigenobu Okuma as President. The leading thought of this party was English liberalism, and it aimed at a healthy, mild policy with the educated class of people as its central constituency. It was, therefore, natural that the Kaishin-to won the sympathy of the intelligentsia of the cities, while the Jiyu-to got a hold on the people in the country districts, where the inhabitants were peasants who sympathized with more radical political thought because of their long sufferings under the feudal governments. Many parties were born contemporaneously. Besides the Kaishin-to and the Jiyu-to, 40 other parties, mostly local, were said to have been formed.

The first Ito Cabinet, which was organized in 1885 was not, of course, connected with any political party.[1]

The First Election The Jiyu-to was once dissolved into smaller groups, and the first general election was carried out on July 1, 1890, amid a general confusion of political parties. Its result, so far as the political parties were concerned was as follows:

Daido Club 55, Kaishin-to 46, Patriotic Public Party 35, Conservative Party 22, Kyushu Association 21, Jiyu-to 17, Jichi-to 17, Officials 18, neutrals 69, independents 2.

This result presented a grave problem to the political parties, for none had a clear majority in the House of Representatives, so various amalgamations were effected before the opening of the first session of the Imperial Diet, and when it opened on November 25, 1890, the classification of the 300 members became as follows :

The Rikken-Jiyu-to (or Constitutional Liberal Party) 130, the Rikken-Kaishin-to (or Constitutional Progressive Party) 41, Taisei-kai 79, National Liberal Party 5, and outsiders 45. The first two were anti-government parties, while the second two were pro-government. The remaining 45 were neutral.

The House of Peers consisted of 252 members, classification being as follows : 10 Imperial Princes, 10 Princes, 21 Marquises, 15 Counts, 70 Viscounts, 20 Barons, 45 High-Tax-Payers, and 61 "Chokusen," i. e. those nominated by Imperial order.

According to the report of K. Suematsu, Director of the Prefectural Bureau, Home Ministry, on the first election on July 1, 1890, the number of voters was 450,365 in all Japan of which abstention was but 6.1 per cent.

Franchise was given only to those who paid national tax of more than ¥15 a year and the prefecture which had the greatest percentage of voters as against the number of population was Shiga prefecture with 2 in every 100 of population, while Osaka and 25 prefectures had more than 1, and all other prefectures had less than 1, Tokyo standing lowest with 0.38. At that time Shiga was the richest prefecture, and Tokyo had but a small number of landowners who comprised most of the voters in the election in the previous century when Japan's industrialization was in its infancy and the accumulation of wealth in cities was just beginning.

Of the 300 members elected, 109, or one-third, was of the samurai class. As to the rate of representation Shizoku or

---

1 For the political movement before the issuance of the Imperial Edict see the Japan Year Book, 1933.

Digitized by Google

the samurai class sent 1 person in every 18,132 to the House of Representatives while Heimin or the common people sent 1 person in every 207,438. The number of people of the samurai class was 1,976,480, while that of the common people was 37,630,754 out of Japan's total population of 39,607,234 in 1890.

The average age of members was 42.3 classified as follows :

Age	No. of members
31	7
32–37	85
38–43	99
44–47	40
48–61	59
Above 62	10

The average age was more than 10 years younger than that of the members of the House in the 17th election in 1930, which was 52.6. Several reasons may account for this change, but probably the strongest was that, political questions rather than business enterprises held by far the greater attraction for the ambitious men in their thirties and forties, for politics was almost the sole topic of national interest at the time of the first election. Another reason is in the natural increase of the age of old members who have been elected many times.

The first platform of the Constitutional Liberal Party was : (1) To maintain the sacredness of the Imperial House and to extend the rights of the people, (2) To oppose such policies as might interfere with the individual freedom of the people in home affairs, and to conclude treaties on equal terms in foreign affairs, (3) To realize parliamentary government and organize a party cabinet. And with these ideals the party men waged a fight for the establishment of a real parliamentary government. The number of anti-government members in the Lower House far exceeded that of the pro-government, and the bureaucratic Yamagata Cabinet feared for its very existence. Hostilities between the two started with the choice of the President of the House of Representatives and continued over the first budget subjected to the discussion of the House. The budget amounting to ¥83,075,000 was cut down to ¥75,194,300, or about 9% reduction. But the first session of the Imperial Diet was closed in March, 1891, without dissolution.

Itagaki's Party Suffers The party which suffered most from the poison of secret governmental control was the Constitutional Liberal Party, and they held a general meeting at Osaka immediately after the first session of the Diet. At the meeting, Itagaki, who had retired when the party had been once dissolved, was again chosen President, its name was made simpler by cutting away the first word "Constitutional," and the unity of its members was strengthened. The Matsukata Cabinet was formed in May of the same year ; its head was as strong a foe to political parties as Yamagata, if not more so. Then there occurred, on May 11, 1891, the attack of a murderous fanatic on the Crown Prince of Russia at Otsu near Lake Biwa and a great earthquake wrought fearful destruction in Gifu and Aichi prefectures ; the Government was unable to cope with these emergencies while it was discredited in its policy against the parties.

Matsukata Cabinet Falls The second session of the Imperial Diet was convoked on Nov. 21, 1891, in a menacing atmosphere from the outset, and was finally dissolved on Dec. 25. The general election of Feb. 15, 1892, was carried out under extreme interference of the Government. Shinagawa, Minister of Home Affairs, ruled the local governors with an iron hand and used every measure for obtaining as many pro-governmental members as possible, the freedom of the vote being completely trodden underfoot. It was reported that 25 persons were killed and 388 were injured in this savage struggle. The result was, however, the victory of the anti-governmental party men, who numbered 163 against 137 of the pro-governmental. The unconstitutional policy of the Home Minister provoked the indignation of the people and Ito, President of the Privy Council, and compelled the Cabinet to change the Home Minister, and caused a discord among Cabinet members. The House of Representatives passed a vote of non-confidence in the third session, although the stubborn Matsukata Cabinet clung to its position in defiance of it.

But the Cabinet fell to pieces from within, right after the third session of the Diet, and the second Ito Cabinet was formed in August, 1892. It was Ito who drafted the Constitution and stood aloof from the political parties, although he later became the President of the Jiyu-to or the Liberal Party himself. And the Ito Cabinet cleverly managed the fourth session of the Diet which threatened a collision between the Cabinet and the Diet over the question of the Budget. But the Cabinet was taken to task by the Diet over the misbehaviour of some Ministers and the fifth

Digitized by Google

session was dissolved without any reason given on Jan. 30, 1894. At the third general election which occurred on March 1, 1894, the Ito Cabinet took a very fair attitude because Ito was always anxious to be or at least to seem constitutional. Its outcome was again disadvantageous to the Government, and the sixth session, which was convoked on May 12, 1894 was dissolved on June 2 because of the non-confidence resolution on the last dissolution and the diplomatic inability of the Government. It may be remarked here that Tsuyoshi Inukai, the late Premier, appeared on the surface of the political world for the first time at this session. He was a member of the Lower House from the beginning and had organized a progressive party of his own a little before this, but his motion of wholesale non-confidence was the first occasion that his earnestness and sincerity for the maintenance of parliamentary authority began to show itself.

The Sino-Japanese War The interval between the sixth and seventh sessions was but half a year, yet it was marked by many important political and diplomatic affairs. The Sino-Japanese War, 1894–1895, broke out in July, 1894. The general election was carried out on September 1 of the same year. The seventh session had been expected to witness a repeated collision of the Diet and the Government, but the first international war drew all the attention of the people and the session closed peacefully after lasting but four days instead of a week as fixed, on the 22nd of October, 1894, at Hiroshima, where the Emperor was staying during the war to command the Imperial Army and Navy. All parties were united for the national cause and supported the Government with one accord, and the military emergency budget amounting to ¥150,000,000 was immediately passed without any reduction. All the political conflicts at home were stilled in the face of the international war and the eighth session convoked on Dec. 22, 1894, was quietly carried out. The peace treaty with China was sanctioned on March 20, 1895. But the interference of the Three Powers on the lease of the Liaotung Peninsula aroused indignation throughout Japan, and this feeling soon centred in an attack on the Government.

A Political Bloc The Kaishin-to, Kakushin-to, People's Association, Chugoku Progressive Party, Financial Kakushin-to and Ohté Club were united in criticizing the Government's weak diplomacy, and formed a union called the Central Representative Club. The Liberal Party did not join the Club, because it had come to some understanding with the Government, and had a special connection with Ito, who gradually had drawn nearer to this political party. Just before the 9th session the Liberal Party took off its mask and openly declared its coalition with the Ito Cabinet. This was the first instance of a political party being publicly united with the Government.

The Progressive Party Ito's policy was a success and the 9th session ended in the victory of the Government by the faithful support of the Liberal Party. The defeated parties recognized the need of a stronger union and on March 1, 1896, the Kaishin-to, Kakushin-to and three other bodies dissolved themselves and organized the Shimpo-to or Progressive Party under Okuma. The platform of the new party was to exalt the sacredness of the Imperial House and to advance the rights and welfare of the people, (1) by establishing a responsible cabinet with the removal of political evils, (2) by enlarging the national power with the renovation of diplomacy, and (3) by developing private enterprises with the readjustment of the financial policy.

Since then the Liberal Party and the Progressive Party, as the two greatest political parties in the country, became rivals. The members of the Lower House, by party grouping, were as follows at the end of March: the Liberal Party 110, the Progressive Party 100, People's Association 32, Yamaguchi Group 5, Kishu Group 4, unaffiliated 49.

Itagaki Joins Ito After the 9th session, Itagaki of the Liberal Party entered the Ito Cabinet and took the post of Home Minister. The Ito Cabinet was in power three full years and managed numerous political matters of importance but it collapsed in August, 1896, mainly because of the difficulty of making the Budget meet the post-war financial need. The Matsukata Cabinet which came next was a coalition of Matsukata's Satsuma clan and Okuma's Progressive Party, for these two characters were most fitted to manage the financial difficulty of the country. This cabinet took a very progressive policy in removing long existing political evils and financial defects and its activity was welcomed with much expectation. But the Liberal Party, now in opposition, was ready to make attacks against the Cabinet which contained Okuma, their political enemy. The tenth session which was convoked on Dec. 25, 1896, passed off with little trouble for

Digitized by Google

the Government, although the Liberal Party attacked it on the score of its foreign diplomacy. It is to the credit of the Matsukata Cabinet that it established the gold standard of national currency.

Exit Okuma Okuma, Foreign Minister, resigned in November, 1897, and the relation between the Cabinet and his party was severed. Matsukata now endeavoured to get the support of the Liberal Party but in vain, and the Cabinet faced the 11th session of the Diet without any assistance from political parties. A non-confidence resolution was proposed by 38 members in the session and seconded by 150. On Dec. 25, 1897, the Lower House was suddenly dissolved, but the Cabinet itself resigned in miserable defeat. Ito was ordered to form a cabinet for the third time, and it was again a transcendental one. The 12th session was begun on May 14, 1898. The Government proposed an increase of taxes on land, saké, and incomes, but was defeated by an absolute majority of 247, and the House was dissolved in revenge. This action of the Government, however, greatly stimulated the development of anti-governmental parties and brought about an extraordinary political phenomenon. It was but a faint herald of the dawn of party government, but it gave a real shock for the first time to the foundations of the clan and bureaucratic forces in Japanese politics. Both the Liberals and the Progressives had had a very hard time in the past to wage war against clan statesmen and bureaucracy, but in most cases they had been treated by the latter like mere instruments for accomplishing their own purposes. Now they came to their senses and saw that their real foes were these same clansmen and bureaucrats who monopolized the government, and that their first aim must be the destruction of them. On June 21, 1898, both parties held final meetings simultaneously and dissolved themselves, and on the 22nd they all met at the Shintomi Theatre, Tsukiji, Tokyo, and amalgamated themselves into a new party, the Kenseikai, or Constitutional Party, to put an end to bureaucratic government and to establish a party government.

The Kenseikai and Ito All the elder statesmen, clan and bureaucratic bodies were alarmed in the extreme by this organization of the Constitutional Party. A meeting was called before the Emperor on the 24th and a hot discussion on counter measures against the power of the party was continued for several hours. Ito asserted that there were but three ways for him to meet the situation: either to form a governmental party himself to carry on the government, or to resign first and form a party to support the Government from outside, or lastly to surrender altogether before the Constitutional Party and let them organize a cabinet with Okuma and Itagaki at their head. Yamagata of the Nagato or Choshu clan was firmly opposed to this proposal and declared, "It is against the Japanese Constitution to establish a cabinet upon a party foundation; let us quit the Constitution for the time being if necessary to meet the critical moment!" On June 27, 1898, however, Okuma and Itagaki were finally called to the Imperial Court and ordered to form a cabinet. A coalition cabinet was thus formed on the 30th of that month, all the posts except those of Navy and War Ministers being filled by party men. Its composition was as follows:

Premier and Minister of Foreign Affairs, Okuma (Progressive); Home Minister, Itagaki (Liberal); Minister of Finance, Matsuda (Liberal); Minister of Justice, Daito (Progressive); Minister of Education, Ozaki (Progressive); Minister of Communications, Hayashi (Liberal); Minister of Agriculture and Commerce, Oishi (Progressive); Minister of War, Katsura (Choshu clan); and Minister of the Navy, Saigo (Satsuma clan).

It was, however, a combination of antagonistic forces for convenience' sake, and the partisans soon began to quarrel among themselves, so that the Constitutional Party, which tried to advance too quickly, soon split up again into the former Liberal and Progressive Parties, largely by the tactics of Toru Hoshi, who played an influential part in politics as a member of the Liberal Party, and was assassinated later in a room of the Tokyo City Hall. So the first party cabinet was compelled to dissolve without meeting a session of the Diet on Oct. 31, 1898, within four months of its formation.

Yamagata Returns Now came the turn of bureaucracy again, under Yamagata of the Nagato or Choshu clan (these two Japanese words indicate the same Nagato province at the south-western end of the Main Island), in November, 1898. Yamagata had had bitter experience with political parties and this time he succeeded in getting the support of the Liberal Party (which called itself Kenseito as yet) and handled the 13th session of the Diet as he wished, many important revisions of the national laws being made.

Digitized by Google

and the military preparations being enlarged by raising the taxes on many important items.

It was during the life of this cabinet that the new treaties which had been concluded with foreign nations at the time of the former Ito Cabinet were put into force, and Japan came to stand on an equal footing with the other civilized countries of the world politically and diplomatically. This was on July 17, 1899. The Yamagata Cabinet accomplished great feats in the administration of complicated and extensive political affairs after the Sino-Japanese War, and laid the foundations for the future development of Japan. But as a representative of the old bureaucracy, a survivor of the discarded clan officials, he left many bureaucratic traces in the law and the governmental system by establishing the rule that the posts of War and Navy Ministers can be held only by officers on the active list, and by enlarging the power of the Privy Council, which hindered the healthy development of political parties in later days.

Satisfied with his own performance in the enlargement of military preparations, completion of laws and institutions in general, revision of the election law, improvement of local governments, and advancement in the educational system and institutions, Yamagata tendered his resignation to the Throne in September, 1900.

Ito Forms the Seiyukai A little before that, Ito returned from his tour of China and wanted to organize a powerful political party himself, and the Liberal Party was anxious to get him to revive its power after its separation from the Yamagata Cabinet. The party wished to put Ito at its head, while Ito wanted to organize a party purely of his own without the help of any existing party. But the general trend of political affairs at this time finally compelled these two to become united into one, and the Liberal Party was renewed by Ito, assuming a new name, Rikken Seiyukai, or Constitutional Party, on Sept. 15, 1900. On Oct. 9, 1900, Ito formed a cabinet for the fourth time, and it was welcomed by the party men and the people at large, but the reactionary movement of the House of Peers shortened its life, and Ito never again had an opportunity for organizing a cabinet, although he had much to do yet for national politics, especially in the field of Korean affairs.

The Katsura Cabinet On June 2, 1901, General Katsura formed his cabinet upon the basis of bureaucracy again. Katsura and the members of his Cabinet were rather young compared with those of the preceding cabinets, and the Elder Statesmen were anxious about their ability, but Katsura was quick to see the unrest in the Seiyukai and immediately took steps to control it for the convenience of the Government. In this he succeeded fairly well, and the 16th session of the Diet passed off in peace, at the beginning of the year 1902, winning, at the same time, the general applause of the people on the conclusion of the Anglo-Japanese Alliance on Feb. 12, 1902. The 7th general election was held on Aug. 10, 1902, in which the number of the Lower House members was enlarged from 300 to 376, and as the result the Seiyukai gained 189 seats, the Kensei-honto (Progressive Party) 104, the Empire Party 18, the San-shi Club 7, and independents 58. As is always the case with a bureaucratic cabinet, even this clever and skilled tactician met with strong opposition from the Elder Statesmen and the two great parties over the problem of raising funds for naval expansion by increasing the land tax, and the 17th session was dissolved because of a direct collision between the Lower House and the Katsura Cabinet. It did not end in the victory of the Government, but Katsura again made a painstaking effort to utilize parties, and found a way out in the 18th session by changing his policy from raising the land tax to floating a public loan to obtain the necessary means for the proposed naval extension.

Saionji Succeeds Ito The Katsura Cabinet had been in power over two years already and the general atmosphere suggested a change when the threatening state of affairs in Manchuria was further complicated by the aggressive policy of the Russian Government. Katsura was ordered to stay at his post although he tendered his resignation, largely because of the pressure of Ito, who was a Genro (see Chapter IV, Government, for the meaning of "Genro") and the head of the Seiyukai at the same time. According to the advice of Yamagata and Matsukata, who were also Genro, Ito and Saionji exchanged positions and President Ito of the Seiyukai was appointed President of the Privy Council; while Saionji, President of the Council, succeeded Ito as President of the Seiyukai.

Saionji is the only remaining Genro at present. He was a progressive statesman, and it was his earnest desire to see a pure party cabinet come into existence. He had been many times suggested as Premier but had always re-

Digitized by Google

fused, as he considered it unreasonable and bureaucratic to form a cabinet with no backing in the House of Representatives, so he gladly accepted this proposal of the Seiyukai and made great efforts for the revival of the party, which had shrunk to 120 from its absolute majority of 193 at the beginning of the 18th session largely because of long inner disturbances.

At the same time, the rival party Kensei-honto was also experiencing the same kind of internal troubles because of Katsura's despotic policy for reducing the power of all parties, and it was natural that the two parties should unite to impeach the Katsura Cabinet. The 19th session was convoked at the end of 1903, with Kono as President of the House of Representatives and Iyesato Tokugawa, that of the House of Peers. But this session was dissolved immediately after its opening meeting because of the resolution impeaching the Government.

War with Russia War was declared against Russia on Feb. 10, 1904. The emergency session of the Diet was convoked on March 18 and the regular one on Dec. 28 of the same year, and in the latter the Diet unanimously passed a budget of ordinary expenses ¥110,000,000 and war disbursement ¥780,000,000. The famous victories at Port Arthur, Mukden and the Japan Sea finally brought peace, and by the mediation of President Roosevelt the peace treaty was concluded between Japan and Russia on Sept. 5, 1905. On the same day riots broke out in Tokyo and other big cities because of the general dissatisfaction with the terms of the peace treaty, and Tokyo was put under martial law. Ito, President of the Privy Council, went to Korea by Imperial Order in November and that country was made a protectorate of Japan, Ito becoming the first Resident-General, while Komura, who returned from Portsmouth, immediately went to Peking and concluded treaties with China on Japanese rights and privileges to settle the problems arising from the peace treaty.

The Saionji Cabinet The Katsura Cabinet remained in power as long as 4 years and 7 months and accomplished several important enterprises, but taking the responsibility for the riots and for a disturbance in the Tokyo Imperial University, which also occurred in connection with the conclusion of the Peace Treaty, resigned in January, 1906, and Saionji was ordered to form a cabinet but failed to organize one of pure party-government because of the great power of bureaucracy behind the national politics. The most important measure in the 22nd session of the Diet was that for the State ownership of all railways. With great difficulty it was passed with an amendment by the House of Peers. The peace-loving Saionji strove for the civilization of Manchuria, transforming the military rule into civil administration. It was an expression of this policy that the South Manchuria Railway Company was established in this year.

While the Seiyukai became prosperous as the government party, the Kensei-honto had a hard time and Okuma finally left it on Jan. 20, 1907.

The Saionji Cabinet continued for two-and-half years fighting against the forces of bureaucracy, and the Seiyukai obtained an absolute majority of 190 at the 10th election, May, 1908. But Saionji left his position a little after the election partly because of his illness and partly owing to the stubborn pressure of the bureaucrats, who were specially critical of his liberal policy toward the socialists, who had gradually increased in number since the Sino-Japanese War.

The Second Katsura Cabinet The second Katsura Cabinet which was formed on July 14, 1908, was of course bureaucratic. One notable event of the 10th election was the appearance of representatives of business men in the Lower House, prophetic of the rise of the business class who now rode on the universal tide of capitalism. Katsura saw the change of the times and allied himself with business men to realize his policy for a readjustment of the taxation system and consolidation of the public loan. But the Seiyukai having no less than 193 seats in the Lower House at the 25th session, Katsura could do nothing without their agreement. With his usual tactics he came to a full understanding with them and the 25th and 26th sessions passed off very quietly.

The Kensei-honto kept only 65 seats in the Lower House and internal discord caused it to dwindle further. But stimulated by the increase of the Seiyukai, it united with other forces on March 13, 1910, and merged itself into a new party named the Rikken Kokuminto or Constitutional Nationalist Party. This new party had 92 members in the Lower House and was led by Inukai and Oishi.

During the three years' régime of the second Katsura Cabinet the outstanding events were the first general arrest of socialists and the annexation of Korea. The latter was hastened by the assassination of Ito by a Korean at Harbin

Digitized by Google

station on Oct. 26, 1909. Terauchi, Minister of War, was appointed to the additional post of Resident-General of Korea in May, 1910, and on Aug. 29 of the same year Korea was at last annexed to Japan.

Army Division Increase Question Saionji became Premier for the second time on Aug. 30 1911. His Cabinet was supported by 214 Seiyukai members in the House of Representatives and this time he could form it without much regard for bureaucracy, although he could not yet wholly get rid of its interference, both public and secret. While he was in power, the Emperor Meiji passed away amid the sorrow and lamentation of the people on July 30, 1912, and the Emperor Taisho came to the Throne. After this national event, bureaucratic forces began to work again and caused General Uyehara, Minister of War, to propose an increase of two Army divisions. Uyehara resigned his position independently because of the rejection of his proposal by the Cabinet. Saionji asked Yamagata to recommend his successor, but this Elder Statesman, who had himself established the military minister system for military and naval departments, and was the leader of the bureaucratic and military forces, rejected Saionji's request, and the Cabinet collapsed at once.

But this plot of the dark forces stirred up the party men to the extreme, and loud cries arose for the destruction of bureaucracy and protection of constitutional government, when Katsura appeared for the third time to form his bureaucratic government. Katsura tried every means to still the general antagonism, but in vain. Inukai, Ohoka and other influential party men led the national movement with the backing of public opinion for putting an end to bureaucracy, and the situation became so critical that to push Katsura's policy further meant something like the outbreak of a civil war, consequently he was compelled to resign after but 53 days. This was an epoch-making event in the political history of Japan and real party-government was now at hand although Katsura was succeeded by Yamamoto, who was one of the foremost navy men at that time.

Yamamoto to Okuma The defeated Katsura sadly realized the power of parties and organized the Rikken Doshikai or Constitutional Comrades Party after his resignation, and the 31st session of the Diet was held at the beginning of 1914, with the classification of members of the Lower House as follows :

Seiyukai	203	Chuseikai	37
Doshikai	93	Independents	7
Kokuminto	40		

The Yamamoto Cabinet was supported by the Seiyukai and had no doubt about passing the Navy Increase Bill, but the unexpected exposure of bribery in high naval circles, the so-called "Commission Scandal", caused the overthrow of the Government at the end of March, 1914. The council of Genro had difficulty in choosing the person to be recommended for the Premiership and after considering several candidates Okuma was finally ordered to form a cabinet.

About 15 years had passed since Okuma left his party the Kenseito, and when he once more took the position of Premier the public welcomed him with sympathy and he answered to the public goodwill by reducing the power of navy men in politics with the support of the Doshikai which contained many former members of the old Kenseito. It was during his premiership that Japan entered the World War on Aug. 23, 1914.

It was the Seiyukai's turn to tread the thorny path of opposition. President Saionji had left it in 1913, and Hara had been its practical leader since then, and the number of members was declining when the question of election of the President arose. Opinions were divided and many a member wanted to call Saionji back, but he was too unselfish to accept the proposal and earnestly recommended Hara to be the new President of the Seiyukai.

The new President Hara was a plain untitled man, but a man of rare ability, and the Seiyukai renewed its strength under his leadership.

Okuma's Sweep The 35th session was dissolved because of the rejection of the Army Division Increase Bill by the Seiyukai and the Nationalist Party. The general election of March, 1914, ended in victory for the pro-government parties, largely because of the aggressive interference of Oura, the Home Minister, the backing of a business clan and the sympathetic campaign conducted by the faculty and students of Waseda University, which had been founded by Okuma. The Doshikai gained 150 seats in the House of Representatives against 104 of the Seiyukai, which was reduced to half its former number. But the latter stubbornly attacked the Government on Oura's interference with the election and other matters, and compelled Oura to leave the Cabinet by bringing a public suit against him. O-

Digitized by Google

kuma once tendered his resignation to the Throne in relation to this matter, but was asked to stay at his post and reorganize the Cabinet on July 30, 1915, thereby prolonging its existence for three months.

The Rice Riots At this time the Kenseikai was organized under Takaaki (Komei) Kato by the combination of the Doshikai Party, the Koyu Club, and the Chuseikai on Oct. 10, 1915, in the expectation of organizing the next cabinet. But Masataké (Seiki) Terauchi was recommended instead, and he again formed a transcendental government, a sort of off-shoot of the old Choshu clan; he soon met with a vote of non-confidence by the Lower House, and the 38th session was instantly dissolved. After the general election the Terauchi Cabinet got the support of the Seiyukai and the Nationalist Party and managed to get through the 39th and 40th sessions without damage to the Government. But the general cost of living shot up to unreasonable heights owing to the vast increase of capitalistic business during the World War, and the artificial rise in the price of rice caused nationwide rice riots in August, 1918, which shook the foundation of the Cabinet, so that Terauchi was forced to resign on Sept. 21.

Formation of Party Government

Among the five Genro, Inoué and Oyama, who had been the commander of armies at the time of the Russo-Japanese War, had died, and Yamagata, Matsukata and Saionji were the only ones now left, and they chose Saionji, the youngest, to be the next Premier. The Emperor requested Saionji to form a cabinet, but he was clever enough to see the progress of democracy among the people and courteously declined the Imperial appointment and recommended Hara instead. Yamagata finally yielded and gave his consent to this decision, but asked Hara to form a coalition cabinet of the Seiyukai and the bureaucrats.

The First Party Cabinet Hara rejected his suggestion and for the first time in Japanese party history a cabinet was organized by party men only, except for two or three ministers who were mostly pro-Seiyukai.

As was mentioned above, the political parties of Japan were originated by the statesmen of the samurai class and had much of the bureaucratic element in themselves, and the clan statesmen had the confidence of the Imperial Court and wielded real power in general politics as a matter of fact, regardless of the public opinion represented and expressed by the political parties or through the press. Up to the first half of the Taisho Era the political parties could not make much progress as independent bodies, and were almost always made use of by the clan statesmen or military leaders, not having enough power of their own to form a party cabinet, but allowing themselves to become tools of bureaucracy even when the head of the party himself organized a cabinet. But the remarkable development of capitalism and the rapid progress of democratic thought among the people at the time of the World War and afterwards caused a decline in the power of the bureaucrats. The coming of Hara, President of the Seiyukai, who was a commoner, into power gave almost the last blow to the old bureaucracy, which gradually faded away by the beginning of the Showa Era.

Hara's Policy The policy of the Hara Cabinet was, in outline, the completion of national defence, the improvement of the educational system, the promotion of all business and the adjustment of traffic organs. The establishment of the jury system, the improvement and enlargement of the higher educational organs, and the revision of the Election Law must be counted to the credit of this Cabinet. Hara showed his democratic spirit in revising the military governmental system of Taiwan and Chosen so that a civil official might become the Governor-General of a colony. The 41st session passed without much disturbance. But the Seiyukai had not yet an absolute majority and when the anti-cabinet parties proposed the bill of universal suffrage at the following session, Hara took advantage of it and dissolved the Lower House to get his much-wanted majority. The result of the general election held on May 10, 1920, was as follows:

Seiyukai	279	Kokuminto	29
Kenseikai	108	Neutrals	48

Hara was able to do as he pleased, for he again had the support of the great Seiyukai, and pushing aside all opposition from his political foes he was advancing brilliantly toward the completion of the said policies when he fell a victim to the dagger of a young assassin at Tokyo Station on Nov. 4, 1921. He was succeeded as President of the Seiyukai by Korekiyo Takahashi, who organized his Cabinet after the incident, but it was short-lived and was compelled to resign within 6 months. The Seiyukai had troubles among them-

Digitized by Google

selves, while the other great party, the Kenseikai, was rather weak so that bureaucratic cabinets were organized one after another for about three years. When Count Kiyoura formed his bureaucratic Cabinet in Jan., 1924, the Seiyukai was divided into two on the question of supporting or not supporting the new cabinet, and the majority of its members who were pro-cabinet seceded from the Seiyukai and organized the Seiyu-honto under the leadership of Yamamoto, Motoda, Nakahashi and Tokonami.

The General Election of 1924 The Kiyoura Cabinet dissolved the 48th session of the Imperial Diet and at the general election which was held in May, 1924, the opposition parties, namely, the Kenseikai and the Kakushin Club stood up against the Government rallying their forces in defence of parliamentarism, and under Premier Kato who was the head of the then largest party, the Kenseikai, a coalition cabinet of the three parties was realized. This was a death-blow to the bureaucracy of Japan; the clan chieftains and bureaucrats entirely lost their power as a political class and the bourgeois parties completely took their place, the final blow being the passing of the Universal Suffrage Law at the 50th session of the Diet.

Universal Suffrage

The 50th session of the Diet was convoked on Dec. 25, 1924, and it became a memorable one by passing the Universal Suffrage Bill. The demand for universal suffrage had a long history, but it seemed impossible to realize it as long as bureaucracy had its iron grip on all such questions. But the time had come for the mass of the people to voice their convictions on politics with freedom. This time the Government itself drafted the bill and it was first subjected to the examination of the Privy Council. The conservative Council advised revisions and the Government sent to the House of Representatives which passed the original bill of the Government and sent it to the House of Peers. The latter House could not directly oppose it, but passed it with amendments on weighty points pretty nearly to the same degree as those of the Privy Council. The consultations between the two Houses were repeated, and the Universal Suffrage Bill was at last passed, to come into force on May 5, 1925. The antagonistic attitude of the House of Peers toward universal suffrage resulted in a revision of the House of Peers Law to the effect that the number of Kazoku or noblemen among its members was decreased.

Side by side with the accession of the bourgeois parties to power, there broke out many political movements of radicals and proletarians in the form of political parties (see the following articles on these parties). Radicals among the existing parties organized their own party, the Kakushin Club, mentioned above, in Nov., 1922, by the combination of the group of Ozaki, Shimada and their comrades who had left the Kenseikai, with the Nationalist Party which was led by Inukai, and one other group. But in May, 1925, it broke up, and Inukai and his colleagues joined the Seiyukai. Later the Kakushin Club dwindled into a very small party, although it played an important part in the doings of the Imperial Diet.

There was another movement organized by businessmen under the leadership of Sanji Muto in April, 1923, but this party was unable to get much sympathy from the general public.

Tanaka to Hamaguchi Viscount Takahashi resigned the Presidency of the Seiyukai and General Baron Tanaka was called to succeed him in April, 1925. This change broke up the unity of the Coalition Cabinet of the three parties mentioned above, and it was forced to give up office. It was followed by a Kenseikai Cabinet under Premier Kato in August of the same year. The Premier fell ill and died, and Wakatsuki, the new President of the Kenseikai was ordered to form a cabinet in January, 1926. Tokonami, who led the Seiyu-honto, took a very ambiguous attitude toward the other parties, but finally joined Wakatsuki and the two parties became one on June 1, 1927, assuming the new name of Minseito. Of this new party Hamaguchi became President while Wakatsuki and Tokonami were made advisers.

On the other hand, the Seiyukai began to rally its power gradually under the leadrship of Tanaka, inviting Inukai and his comrades and a part of the Seiyu-honto to join them and after the collapse of the Wakatsuki Cabinet in April, 1927, the Tanaka Cabinet came into being. But unsatisfied with the result of the first general election by universal suffrage in 1928, they tried to collect as many members as possible from among the neutrals and the Minseito. At the same time, Tokonami, who had lost hope of becoming the head of the new Minseito Party, seceded from it in August of the same year, and afterward, when the Hamaguchi Cabinet was formed in July, 1929, he went back to his old home, the Seiyukai.

Digitized by Google

In July, 1929, Hamaguchi organized the Minseito Cabinet and his party won an absolute majority in the House of Representatives as the result of the second universal suffrage election in the following year. But on Nov. 14, 1930, Hamaguchi was shot at Tokyo Station, and although he lived another year his wound finally proved fatal and hard times again visited the Minseito. Wakatsuki became its President again and formed a Cabinet in April, 1931.

With retrenchment as its warcry, the Wakatsuki Cabinet carried out a general reduction of the salaries of officials and tried to make readjustments in the administrative, financial and tax systems, but without success. The Manchurian Incident of Sept. 18, 1931, occurred near Mukden. The Manchurian problem and the relations between Japan and China had been becoming more acute year by year and the Manchurian railway affair called the attention of the world to the impending collision of the two nations. The incident proved a turning-point in the drift of national politics which now headed in a very different direction not only in diplomacy, but also in many home affairs. The Army and Navy took the lead over the Manchurian problem, no doubt, but they could do so only because the people at large sympathized with and supported them. The budget for the fiscal year 1931-1932 could not be made out without floating a national loan or increasing the taxes, which would of course be most unwelcome to the people. Rowdiness and riotous struggles in the House of Representatives at the 59th session which was held at the beginning of 1931, greatly lowered the standing of the House in the eyes of the people and the inability of the Imperial Diet to take any decided course of action after the Manchurian Incident brought parliamentary government into discredit with the nation, and this state of affairs much affected the stability of the Wakatsuki Cabinet. In October, 1931, Wakatsuki expressed his wish to resign, and there arose discussions on the wisdom of forming a new cabinet which might combine the forces of the Minseito and Seiyukai. But opinion was divided, and in the end the Wakatsuki Cabinet was forced to resign on December 11.

Inukai and the Embargo Inukai, who became President of the Seiyukai in 1929 after the death of Tanaka, publicly announced his idea of reimposing the gold embargo at the general meeting of his party on November 10, and the resignation of the Wakatsuki Cabinet, which came immediately after it, therefore, suggested the possibility of something serious taking place with the choice of the succeeding government. Saionji, the Genro, laid the nomination of Inukai to the Premiership before the Throne, and on December 13, 1931, the single Seiyukai Cabinet came into power.

The Inukai Cabinet proclaimed the reimposition of the gold ban on the day following its installation, as had been expected. This Cabinet had a minority in the Lower House, so they intended to dissolve the Diet at the coming session when suitable occasion arose, to seek for an expression of national confidence at the general election, and hastened to make preparations for it. Hardly had a week passed before it changed most of the local governors to those who were favourable to the Seiyukai, because these officials had direct influence over the general election. The new Cabinet assumed the post but two weeks before the 60th session of the Diet and had no time for planning a budget of its own, which made it necessary for it to borrow that of the Wakatsuki Cabinet. It was, nevertheless, presented to the Diet with some changes or revisions, but it failed to be passed because of the dissolution of the Diet on January 21, 1932.

Previous to this, an unexpected event endangered the life of the Cabinet. It was nothing less than a bomb thrown at the Emperor's procession near the Sakurada Gate of the Palace Grounds and before the headquarters of the Metropolitan Police. The Emperor and an Imperial Prince narrowly escaped injury. This act of "lèse majesté" compelled the cabinet to resign, but the Emperor did not ask them to assume responsibility, and encouraged them to continue in office, and Inukai and other members of the Cabinet pledged their patriotism and loyalty to the Throne, in spite of public opinion which was rather against their holding on to the reins of power.

The Seiyukai's Victory The general election of Feb. 20th was carried out amidst the apparent apathy of the people because their attention was absorbed by the Manchurian problem and the events in Shanghai which seemed to be impelling the nation towards international discord, with war as a final outcome. But the result was that the Seiyukai, the government party, piled up the grand majority of 304 while the Minseito dwindled to 146.

The Seiyukai Cabinet, which had gained the absolute majority in the House of Representatives, was to call an extraordinary session of the Diet in

Digitized by Google

March to decide upon the emergency military expenses.

The May 15 Affair In the meantime, the new State of Manchoukuo was born, and the activities of international diplomacy helped to solve the complications in Shanghai, warfare there being terminated by mutual agreement. But Japan's international relations became strained and the world's attitude toward Japan became increasingly unfavourable, which reacted badly on the Inukai Government. The financial condition held out little hope for the business world, and the Government was unable to make any positive plans for the present and future of the public welfare. On the other hand, the general social and political unrest, and the discredit brought on parliamentary government helped the rapid growth of national socialistic thought in the minds of the people, and the organization of various Fascist associations among the hot-heads, both young and old. The repeated assassinations disturbed the public mind to the last extreme, and alarming rumours spread from the metropolis to the remotest parts of the Empire. The veteran statesman Inukai, the Premier, was eager to protect parliamentarism by making a thorough improvement of the political parties and realizing an even distribution of political benefits among the people in general instead of a partial accumulation of it in the hands of privileged classes. But the younger elements of the nation were too hasty-tempered to place reliance in his words and idealism, and on the evening of May 15, 1932, a dozen young cadets and officers of the Imperial Army and Navy armed with pistols broke into his official residence at Nagata-cho, Tokyo, and finding him in his Japanese sitting room pointed their weapons at him. "Wait a moment," said Inukai quietly. "Let us talk things over and you will understand my ideas." But without answering a word they fired, and the Premier fell. At the same time another band of young farmers attacked the transformer stations in the suburbs with intent to throw the city into darkness, but they were caught before they could carry it out.

The Saito Cabinet Consequently the Cabinet, having lost its head, immediately tendered its resignation to the Throne. Saionji recommended Viscount Saito to the Throne after a thorough consultation with such experienced statesmen as might well be called vice-Genro. The Saito Cabinet was composed of five bureaucrats, three representatives of the House of Peers, three Seiyukai members, and two Minseito members, so that it was called a "National Cabinet."

At its second extraordinary session in 1932, the Imperial Diet passed the most important resolutions on the relief of the financial hardship of farmers and the recognition of the new state Manchoukuo. The latter was carried out in spite of obstacles, visible or otherwise, and to carry out the former decision a vast amount of money was needed in order to give substantial aid to the hard-stricken farmers, with their debt of ¥4,000,000,000.

The 64th Session of the Diet The 64th session of the Imperial Diet was convened on Dec. 24, 1932, with the following line-up in the Houses:

House of Peers:

(Number of members, 402, vacancies 4)	
Imperial Princes	18
Kenkyukai	148
Koseikai	69
Dowakai	41
Kōyū Club	40
Kayokai	34
Doseikai	15
Independents	37

House of Representatives:

(Number of members, 456, vacancies 7)	
Seiyukai	298
Minseito	116
Kokumin-Domei	32
Proletarian Parties, etc.	13

This session closed on March 25, 1933. It was a peaceful or rather monotonous one, and passed the budget of over ¥2,300,000,000 without a single cut, and 51 of the 53 bills proposed by the Government and 7 of the 97 bills proposed by the members of the Diet. Among those passed, there were such important laws as the Farm-Village Debt Readjustment Law, a law for the relief of the people of Tohoku district who had suffered from earthquake and tidal waves, the Child Ill-treatment Prevention Law, the Juvenile Protection Law, and the revision of the Iron-manufacture Promotion Law which meant the union of all the largest iron-manufacturing works.

Political Movement of the Proletariat

There were frequent outbreaks of rice riots in the days of the Tokugawa Shogunate. But the samurai class was above the farmers and artisans, who had neither political power nor military force.

Labour Movement Takes Shape When modern commerce and industry were

Digitized by Google

introduced to Japan in the Meiji Era and capitalism began to have sway over the working people, labour movements became active as a matter of course.

On the 1st of December, 1897, the Iron Workers' Union was organized in Tokyo with over one thousand members, and this was the first trade union in Japan.

Public Peace Police Law In 1900 the Imperial Diet passed a bill and enacted it into a law. The law was entitled the Public Peace Police Law. It proved to be the death knell to all phases of the labour movement, preventing the working classes from organizing themselves into unions. The law practically prohibited the industrial working classes as well as the tenant farmers from agitating in their own interests and against the employers and land-owners. And later the law was interpreted to mean that all labour movements were a crime.

In 1901, a socialist party was organized which was called the Social Democratic Party, the original members being S. Kotoku, I. Abé, N. Kinoshita, K. Kawakami, K. Nishikawa, and S. Katayama. It was soon suppressed by the authorities and transformed into a non-political organization, namely, the Socialist Association.

Marxism Introduced It was in 1903 that the socialist theory of Marxism was first introduced to the Japanese radicals, and the theory soon attracted large numbers of students. In 1906, the Socialist Party was organized for the second time, and on Feb. 17, 1907, the first anniversary meeting of the party was held in Tokyo. The resolution at the meeting announced the aims of the party as follows: a radical and fundamental change of the existing society, universal suffrage, anti-militarism and anti-religion. Later the socialists began conflicts and were divided over the question of socialist tactics into two groups, i. e. Marxists and direct actionists. Secret activities of radical socialists and stern suppression of the same by the Government developed more and more desperate tactics on both sides, and the Government finally came by a chance to destroy the entire socialist movement in the bud. They instituted the famous anarchist trial in 1911, in which Kotoku and twenty-three others were condemned as traitors, and he with eleven others suffered the death penalty.

Marxist propaganda and leadership of strikes and even anarchists' movement did not cease with the trial and execution of Kotoku and his comrades. One of the most conspicuous events in the annals of their movement was the death of S. Osugi and his colleagues at the hands of the reactionaries in the midst of the Great Earthquake commotion in Tokyo in 1923.

But it must be said that Japanese social movement entered upon a new phase by the stimulus from the Russian Revolution in 1917 and its later development.

The Labour-Farmer Party The suppression of the Nippon Socialist Party in 1907 and the stern policy of the Government against socialist movements made the Japanese proletariat suffer and grope in the dark for the next decade.

In June, 1924, a society was established for the study of politics to prepare for the organization of a proletarian party. And by the proposal of the Japan Farmers' Union the first national proletarian party was organized on Oct. 1, 1925, and it was called the Farmer-Labour Party. But this party met the Government's order of suppression on the very day of its organization because of its communistic elements. Thereupon, the left-wing elements were expelled and the right-wing elements, namely the Japan Federation of Labour, were added, and in March, 1926, the Labour-Farmer Party was formed, with Mr. Motojiro Sugiyama as its president.

Schism in Proletarian Parties The Labour-Farmer Party soon became a nest of quarrelling cliques, and the question of opening the door to communistic elements gave a motive for the secession of the Japan Federation of Labour and the right leaders Isoo Abé, Toyohiko Kagawa, etc., who established the Social Democratic Party with the Federation as its main element and Abé as its President on December 5, 1926. The new party rejected communism and insisted upon parliamentarism as a pure social-democratic party.

Contemporaneous with the formation of the Social Democrats, the left-wing elements of the Japan Federation of Labour and the right-wing elements of the Japan Farmers' Union organized the Japan Labour-Farmer Party under the leadership of Hisashi Aso on December, 9, 1926, insisting upon the establishment of a right road for the proletarian movement.

The Labour-Farmer Party, which was stripped of half its force by the continuous secession of the right-wing elements, made Ikuo Ohyama its head and opened its doors to the communistic societies. The result was that it was practically led by the Japan Communists and played the part of a legitimate communistic party; and it was compelled to dissolve on the 10th of

Digitized by Google

April, 1928, being suppressed by the Tanaka Cabinet after the wholesale arrest of the Japan Communists on the 15th of March of the same year.

The old leaders of the dissolved Labour-Farmer Party organized a preparatory society for the establishment of a new party and endeavoured to realize their plan, but always met with the pressure of the authorities, and finally organized the Proletarian People's Party under the theoretical leadership of Hitoshi Yamakawa.

Their Union In the meantime, the right-wing elements of the Japan Union of Farmers organized the Japan Farmer Party with the idea of establishing a representative Japanese party of farmers under the slogan, "Farmers come to the Party of Farmers," on October 17, 1926, and there arose many small local proletarian societies or parties in different districts.

Such rivalry and disunion among proletarian parties naturally called forth a demand for the unification of fighting lines, and the parties, which kept to the middle way, like the Japan Labour-Farmer Party, the Japan Famer-Labour Party and the General Proletarian Party, which were the three national proletarian parties, and the Proletarian Constitutional Party, the People's Party in the central district and two other local parties were all united into one and organized the Japan Mass Party.

The General Proletarian Party organized an anti-separation union and protested against the leaders of the Japan Mass Party, but they themselves were soon dissolved into the Tokyo Proletarian Mass Party and other local proletarian parties.

The leaders of the former Labour-Farmer Party, who had formed a preparatory society for the establishment of a new party just after the dissolution of their party, continued their movement for its reconstruction, but their project was prohibited half-way, and the preparatory society itself was ordered to close. They were thus compelled to organize a labour-farmer union, an illegitimate body, for obtaining political freedom and did not cease to follow a communistic policy. But they were involved in the wholesale raids on the Japan Communists on March 15, 1928, and April 16, 1929, in which the ablest radical leaders were accused of being members of the Communistic Party and were mostly arrested so that their movement came to an end. The leaders who escaped the raid such as Ikuo Ohyama and Hajimé Kawakami organized a Labour-Farmer Party on November 1, 1929. The purpose of their new movement was to proclaim the need of obtaining the right of public activity as a lawful left-wing party by establishing a standing political organization.

While the left and midway parties had been continually combining and re-dissolving, the right-wing party of the proletariat or Social Democratic Party alone developed without a hitch for some time, but in Sept., 1929, the Osaka Union of the Japan Federation of Labour, the main element of the party, separated from the federation and consequently withdrew from the party and established the National Democratic Party on January 15, 1930. But this party was united with the Japan Mass Party on the 20th of July of the same year and formed the National Mass Party.

The N. L. F. Mass Party The movement for the greater union of the proletarian parties was continued and the Society for the Realization of Unity of Proletarian Parties, which was a bloc of those who insisted on the unconditional union among the members of the National Mass Party, the Labour-Farmer Party, organized the National Labour-Farmer Mass Party on the 5th of July, 1931. In this new party there was no head of the central executive committee, but Hisashi Aso, President of the former National Mass Party, was appointed to the chair of the chief secretary, who also served as Acting President. Ikuo Ohyama, President of the former Labour-Farmer Party, retired from all official positions and went abroad. This National Labour-Farmer Mass Party stood between the extreme left and right, but the inner control gradually became loose and Hajimé Kawakami and Kanemitsu Hososeko were expelled along with some other members. These two were arrested as strong sympathizers of the Japan Communists.

Social Mass Party In 1931, the National-Socialist movement suddenly appeared on the surface of the sea of social unrest, and the tide of Fascism began to permeate the proletarian fighting lines; the right-wing of the legitimate proletarian parties turned toward National Socialism. On the other hand, the left-wing was influenced by the Japan Communists, who never ceased their clandestine movements in spite of the constant interference of the authorities, and the power of the proletarian parties was greatly reduced. This state of affairs induced another union, and on the 24th of July, 1931, the Social Mass Party was organized by the union of the Social Democratic Party and the National La-

Digitized by Google

bour-Farmer Mass Party. This new party elected Isoo Abé, Chairman of the Central Executive Committee; and Hisashi Aso, Chief Secretary. The platform of the party was as follows:

(1) We will fight for the protection of the lives of the labour, farmer, and general working masses.

(2) We aim at the destruction of capitalism and the emancipation of the proletariat.

And this new party is acting as a social democratic party, rejecting both Communism and Fascism.

Universal Suffrage and Proletariats Since the birth of proletarian political parties with the purpose of sending representatives to the Diet, there had been three general elections. At the third general election, since the institution of universal suffrage, which was held on February 20, 1932, under the Inukai Cabinet in consequence of the dissolution of the Diet at the 60th session in the previous month the proletarian parties made plans for fighting against capitalistic parties, from their past experiences and on the basis of their characteristic principles and policies, and sending out 36 candidates, fought bravely with public speeches as their only weapon. The result was 5 members elected, with the gain of 290,979 votes. To make a comparison with the former elections, the number of successful candidates on the first occasion was 8 or 3 more, and on the second one it was 5 or the same number as at the last, while in the number of votes they lost at the third election 201,242, compared with the first one, and 207,242, compared with the second one. But the number of the candidates was much smaller than in previous elections, so that the number of votes per capita increased to 8,083 from 5,593 of the first and 5,475 of the second election, or every proletarian candidate at the latest election gained about 3,000 more votes than at the previous two general elections.

The National Socialists

Orientation to National Socialism In 1931 the Labour Union established the Japan Labour Club with the purpose of realizing a great union of the right wing. Stimulated by the supremacy of Fascism in Italy and the Fascisti movement of the Nazis in Germany, there appeared a movement for National Socialism among the members of the Social Democratic Party. Besides, after the Manchurian Incident the atmosphere among the Japanese people was very suitable for the growth of nationalism and patriotism, and the national socialistic section of the Party increased their power under the leadership of K. Akamatsu, chief secretary, and R. Hirano.

Their Platform At the same time, National Socialism began to make its mark among the members of the National Labour-Farmer Mass Party, which kept to the middle way, and especially it gained power among the members who belonged to the National Labour Union, the strongest supporter of the party. Some powerful leaders of the National Labour Union moved for the establishment of a National Socialistic Party, but their motion was rejected by the party and they seceded from it in one body. The seceders met with those from the Social Democrats, and, on the 29th of May, they established the Japan National Socialist Party with K. Akamatsu at its head.

The rise of the nationalistic tide, which coaxed the proletariat partisans away, correlatively gave inspiration to the activities of the old nationalists, and their leading principles began to take national socialistic colour in compliance with the change of the social state of affairs.

The Production Party The Great Nippon Production Party, an extreme right-wing party, which had hailed Japanese nationalism but vaguely, showed a sudden activity and absorbed the Nippon Nationalists, the Radical Patriots and other parties of similar nature at the end of 1931. Their aim was the reconstruction of anti-nationalistic institutions, according to the fundamental national spirit of Japan.

The Jimmu-kai On February 11, 1932, the anniversary of the Foundation of the Empire, the Jimmu-kai, a strong nationalists' society, was organized. The central element of the society was the Ko-chi Sha of Dr. Shumei Ohkawa, who had intimate connections with military men, and the new party was also helped by Hiroichiro Ishihara, a business man, Daisaku Komoto, a colonel, and the like. At the general election of 1932, rallying the young members of the Ko-chi Sha, the Great Nippon Production Party and other Nationalistic bodies, they sent out bands on a canvassing tour over the whole country for the propaganda of Nipponism. It is said that they gained over 50,000 new members in a month or so of the campaign. (The Jimmu-kai was dissolved in 1935.)

Super-legal Movements of the Rights In addition to the national commotion arising from the Manchurian Incident, the failure of the crops in the north-eastern districts dealt a heavy blow to the poor villagers groaning under fi-

Digitized by Google

nancial depression, and the problem of finding some means of relieving the people in the emergency became so acute that no time was to be lost. This nation-wide suffering and anxiety urged the right-wing movement to proceed to extremities, and they passed far beyond the limits of lawful action. In the midst of the election campaign, on February 9, 1932, Junnosuké Inoué, ex-Minister of Finance, was shot to death by a young man, Konuma, of the Blood Brotherhood League headed by Nissho Inoué, a priest of the Nichiren sect. On March 5, Takuma Dan, Chairman of the Board of Trustees of the Mitsui Company and one of the ablest contemporary business men, was assassinated by Hishinuma, a member of the same secret association. At 5:30 on the afternoon of the 15th of May, Premier Inukai was killed. This was the so-called "5:15 Affair" as it occurred on the fifteenth of the fifth month, 1932. The after-claps of the event appeared in the secret plots of Dr. Imamaki, adviser to the Jimmu-kai, in the middle of August, and of the Tenko-kai and the Independent Young Men's Association in November, finally at the arrest of Dr. Shumei Ohkawa, head of the Jimmu-kai and the Far Eastern Economic Research Bureau.

Later investigations showed that those directly connected with the affair were 10 young Navy officers, 11 students of the Military College and 21 farmers and scholars. After the arrest of members of the Blood Brotherhood League formed by Nissho Inoué, who entertained a plan to kill representative men one by one, his comrades undertook the continuation of the work. Lieutenant Hitoshi Fujii, a leader, had died in the battle at Shanghai on February 5, 1932, but had left a strong influence among his friends. Second lieutenants Kiyoshi Koga and Yoshio Nakamura, who belonged to the Kasumigaura airship corps, began to form bands with a view to bringing about a new government with the military as the central force, in plunging Tokyo into a state of siege by their sudden attack upon the capital. In the plot they were soon united by Kozaburo Tachibana, head of the Aikyo Juku (Village Loving School) of Ibaraki prefecture and a leader of the agricultural movement. Dr. Shumei Ohkawa, Hidezo Toyama, head of the Tenko-kai, and Kenichiro Homma also came to their help and, moreover, supplied them with necessary funds and arms. At 5:30 p. m. May 15, 1932, four bands composed of military officers and cadets armed with pistols, attacked several points of the capital and killed Inukai and others as mentioned above, while another band of farmers attempted to break into the transformer stations to throw the capital into darkness. Most of them were arrested on the day and the sentences for all of them (except one farmer who died in the meantime) were passed by February, 1934, the heaviest penalty given being imprisonment for life for Kozaburo Tachibana, but none of them were sentenced to death.

The Farmer-Central Movement As a result of the May 15 Affair the Saito Cabinet was organized. The new Government called the second Emergency Session of the Diet in June and the third session was held in August, and the Diet passed the "Resolution for the Relief of the Economic Depression," for the purpose of relieving the impoverished villages of the farmers. The motive power of this action of the Imperial Diet was the Farmer-Central Movement of the Self-governing Farmers' Council and its sympathizers which became an incentive to the petition movement for rescue of the peasant villages from the ruin which threatened them.

The Self-governing Farmers' Council was led by the farmer-central idea of Mr. N. Gondo, and rejecting both the strikes of farmers and national socialism, it endeavoured to realize a farmer-central government with the harmonious co-operation of the ruling class and the people, and unifying the landowners, the landed farmers and the tenant farmers. The Council was organized by the association of the Nagano-Prefecture Japan Farmers' Association, the Emancipation Society, Mr. K. Tachibana, the head of the Aikyo Juku (Village Loving School), and Mr. R. Nagano of the Japan Village Government Union, which had been established in 1931, with him as its leader.

Communist Movements

The Nippon Communist Society was apparently broken up by the wholesale raids of 1914 and 1915, and the members who then escaped arrest hid themselves in the depths of society, and secretly continued their endeavours to reconstruct it. But the leaders of the new society, which they organized in 1927, were all arrested on April 16, 1928, and the remaining members had a difficult time to accomplish the work under the constant oppression of the authorities, and the society showed its activity before the public at the general election of 1931. It was for the third time scattered by the iron hand of the Gov-

Digitized by Google

ernment after February, 1931, but it continued its secret activities by order of the International Headquarters with the sub-divisions of the communists. Its slogan of 1932 was "the reconstruction and enlargement of the Society and its popularization." It aims at and works for the abolition of parliamentary government, the destruction or revision of capitalistic control of industry and reactionary labour laws, the relief of international unemployment, the improvement of all labour managements, the betterment of the conditions and privileges of women, the abolition or lightening of the penalties imposed upon communists, and its propaganda among the factory workers and the people at large.

The Kopf[1] This federation of proletarian artists was organized in November, 1932, and it works for the education of labourers, farmers and other workers in politics and economy, the improvement of the labourers' living, the establishment of proletarian civilization on Lenin-Marxism, the freedom of speech, publication, exhibition, drama, movies and broadcasting, the creation of cultural institutions for labourers and all workers.

Political Affairs in 1933–34

The 64th session of the Diet came to an end on March 25, after passing the 1933–34 budget, of over ¥2,300,000,000 and 58 bills. Among the latter there were such important laws as the Farm-Village Debt Readjustment Law, the Relief Law for Tohoku district, the Child Ill-treatment Prevention Law, the Juvenile Protection Law, the Rice Control Law and the Iron-Manufacture Promotion Law.

On March 27 Japan served notice to withdraw from the League of Nations to which she had made valuable contributions for over 12 years (See Chapter VI).

The year also witnessed a decided decline of the left-wing socialistic parties, especially the communists, many of the leaders leaving camp and ceasing activities

65th Session On December 23, 1933, the 65th Session of the Imperial Diet was convened and after the customary recess for the New Year's holiday, resumed its work on January 23, 1934.

Finance Minister Takahashi presented the 1934–35 budget, which amounted to ¥2,112,000,000 (¥8,000,000 less than the previous year), of which ¥1,248,000,000 was to be met by ordinary revenue, ¥19,000,000 to be covered by the balance of the previous year, and ¥785,000,000 to be obtained from loans. Of the ¥785,000,000 loan, ¥606,000,000 was for covering the deficit. (See Chapter VIII.)

Discussions on the 1934–35 Budget continued from January 26 to February 4, and on February 13 the House of Representatives passed it by unanimous vote without amendments. The discussion mainly turned upon the issuance of Government loans, the military expenses, the need of establishing a definite financial plan for the future, and the increase of taxes. As to the last point, Takahashi disclosed his decision to increase taxes at a most convenient time.

On March 14 the Budget passed the House of Peers without amendment. But the amount voted for the relief of farmers was meager and by the request of the Diet the Government presented an additional budget for the purpose amounting to ¥20,990,000 for Japan proper and ¥8,200,000 for Korea, which passed the Diet as a matter of course.

On March 26 the Session adjourned, passing the budget for the fiscal year 1934-35 and 50 laws.

Political Affairs in 1934–35

The Saito Cabinet Resigns The detention on May 19 of Hideo Kuroda, the Vice-Minister of Finance, on charges connected with the Teikoku Rayon scandal was sufficient reason for the resignation of the Saito Cabinet. This was a matter of political common sense. But on the other hand, the charge partook somewhat of a political nature and it was considered unwise to tender resignation hurriedly. So the resignation was delayed, but the development of the case and the outbreak of other cases to the disadvantage of the Cabinet finally compelled Premier Saito to tender resignation to the Emperor on July 3, 1934. The new cabinet with Admiral Keisuké Okada as Premier came to power on the 8th of the same month.

The Okada Cabinet The Okada Cabinet was virtually the continuation of the Saito Cabinet. It was a non-party cabinet, as was the Saito Cabinet, and had likewise the tiding-over of the crisis years as its objective. When forming the cabinet the first plan was to exclude party men, but later this restriction was modified, due to difficulties which such cabinet would pro-

1 Federacio de Proletaj Kultur Organizoj Japanaj.

Digitized by Google

bably meet. Thus it was finally composed of seven men out of officialdom and five party men (2 from the Minseito and 3 from the Seiyukai). The Seiyukai had turned down Okada's invitation to join his cabinet and when three of its members became ministers in the new Cabinet, it forthwith announced their expulsion from the Seiyukai.

Farm-village Problem By the end of October, 1934, the National Treasury disbursed approximately ¥300,000,000 for the relief of farm-villages. This means that the yearly disbursement was approximately ¥100,000,000, and, when left alone, it would necessitate increased taxation. The relief of farm-villages thus assumed the position of an important factor in national finance.

The impending questions which had to be solved were how to dispose of the stock of rice and how to restrict overproduction so as to increase farmers' income by higher prices. The solution of the questions was complicated by the fact that over a half of the farmers could hardly afford to consume rice which they themselves raised because of the high price. This resulted in a shortage of rice in the farm-villages.

In order to cope with the situation, though partially, it was decided at the 65th session of the Diet to increase the fund for purchasing surplus rice, and also the Government undertook to find out more effective means to meet the situation. Under the Okada Cabinet a committee was appointed for the study of the problem from among the members of both Houses and also private persons. The Seiyukai and Minseito were also united in organizing a committee for drafting a more effective law dealing with the problems.

Extraordinary Session and After The Okada Cabinet at first took a lukewarm attitude towards convening an extraordinary session of the Diet in spite of the resolution passed at the last session under the Saito administration and the strong demand on the part of the Seiyukai, which was essentially a farm party. But an unexpected event compelled the Government to give heed to the above demand. A damage greatest since 1923 was sustained in the Kansai district and Central Japan by the typhoon of September 21, 1934. The year 1934 was also a very unfavourable one for farmers. An untimely cold weather checked the growth of rice plants in the north-eastern district and Hokkaido, precipitation was scanty in Shikoku and Kyushu islands, and the south-western half of the country was visited by the typhoon just mentioned. An immediate relief of farmers thus became a national necessity, and on September 28 the Government decided to convene an extraordinary session by December.

The 66th Session An extraordinary session of the Diet was, therefore, convened on November 27 and closed on December 10. The main objective of the session was the relief of the sufferers in a variety of natural calamities in the year. The budget for the relief was as follows :

Year of Disbursement	Amount (in ¥1,000)
1934-5	70,664
1935-6	68,318
1936-and after	74,957
Total	213,940

The budget passed both Houses without amendment, though it was attacked as being too small to meet the need, specially by the Seiyukai.

The 67th Session The regular session of the Diet was convened on December 24, 1934, and closed on March 26, 1935. Notwithstanding the expectation generally entertained of a collision between the Government and the Seiyukai on the various questions pending, both sides were, in the final analysis, willing to come down the wall half way and the session was carried on in peace. The peace was, however, an armed peace and the Seiyukai took care that a number of important government bills were killed. The promise which the Government made at the last session in regard to the relief appropriation was made good to the amount of ¥15,000,000, instead of ¥180,000,000, as was originally demanded by the Seiyukai.

The Government, beside the Budget for 1935-36 which passed without amendment, proposed over 50 bills to the Diet. Of these only 5 important bills passed the Diet and among those shelved there were such important bills as the Rice Control Law, Cocoon Distribution Law, Manure Control Law, Iron and Steel Tariff Law, and the Regulations for Fishing in the Northern Seas.

The session was enlivened unexpectedly with a discussion in regard to the interpretation of the Constitution. It was in February that a criticism on the exposition of the Constitution by Dr. Tatsukichi Minobé, Emeritus Professor at the Tokyo Imperial University and Professor at the Commercial University, was raised. Dr. Minobé's theory is that the Tennō, the Emperor, is the highest institution of the Empire and against this the assailants stat-

Digitized by Google

ed that Tennō is the absolute Sovereignty and origin of all laws. The discussion was ended, at least so far as the Houses and the session were concerned, by the promise given by the Government at the initiative of the House of Peers that it would do all to clarify the specific nature of the Japanese State.

Political Affairs in 1935–36

Legislature The year 1935 was rather a poor one in legislative activities. The 67th session of the Diet passed 44 out of the 55 bills presented by the Government and 3 of the bills proposed by the House of Representatives, but the majority of them were of the nature of administrative rules or in connection with the 1935-36 Budget. Few important laws were passed, the principal ones being the Special Profits Tax Law, the Warehouse Law, etc.

Political Movement of the Proletariat The political movement of the proletariat in 1935 was, generally speaking, a continuation of the previous year. Since 1932 the political power of the proleariat has waned mainly due to the nationalistic atmosphere generally prevailing in the political world. But the elections of the members of prefectural assemblies in the fall of 1935 proved favourable and this served to prepare good ground for proletarian parties to try their fortune in the general election for the Diet.

By this time the Marxists had lost their leaders and their political activities had sunk almost underground. They had lost the support of the people because of their misdeeds, such as attacking banks for funds. And side by side with this the tide of extreme rights had exhausted itself and it had not developed into a political party. It was thus that the Social Mass Party grew to power, which now occupies the leading position in the proletarian political movement. It was in 1932 that the party was formed through the amalgamation of the Social Democrats and the Mass Party. The party sent 53 candidates to the prefectural elections just mentioned and secured 25 seats in the assemblies. In the 67th session of the Diet (1934-35) the Social Mass Party had only three seats in the House of Representatives, but put up a brisk fight against the overwhelming power of the bourgeois parties in the House. They presented two important bills, i. e. the tenant bill and a bill for preventing the attachment on food of farm-households for one year. Both of them were shelved, but a prevention law quite similar in nature was passed. On February 9, 1935, the party held a mass meeting in Tokyo "for demanding the immediate dissolution of the House of Representatives." The meeting adopted 6 resolutions and handed them to the Presidents of both Houses and the Premier. The resolutions urged an immediate promulgation of the emergency industrial labour law, an increase of Government subsidies for unemployment relief, the promulgation of the tenant law and a law for preventing the attachment on food of farm-households, a thorough measure for securing the living of labouring classes in cities, the suspension of payment of all Government bonds for two years, and an immediate dissolution of the House of Representatives.

In the elections of members of prefectural assemblies which were carried out in September and October, 1935, the proletarian parties secured 41 seats and 219,854 votes. A comparison of the last three elections follows :

ELECTION OF PROLETARIAN MEMBERS IN PREFECTURAL ASSEMBLIES

	Candidates	Elected	Votes obtained	Votes for each Candidate
1927	216	28	257,832	1,193
1931	213	17	270,376	1,269
1935	96	41	219,854	2,290

Minobé Case After the close of the Diet, Dr. Minobé's case was taken up after some delay by the judicial authorities. He was heard twice by the judges of the Supreme Court in April and September, and the indictment was revoked, Dr. Minobé voluntarily resigning from membership of the House of Peers. The movement of nationalist groups against him, nevertheless, was continued all through the year and the Cabinet issued a statement on the question again on October 15, 1934, acknowledging the points put forward by the nationalists, but the agitation did not stop then and there.

In the beginning of the year 1935, however, liberalism appeared regaining power and criticism of the actions of the national socialists and militarists was heard in a considerable degree at the 67th session of the Diet. The War Ministry seemed amenable to the criticism, as shown by its thoughts and reactionary action on the part of military bodies, the removal of high officers in August, etc. Public opinion evidently welcomed the War Ministry's policy.

Digitized by Google

The assassination of Lieutenant-General Nagata, Director of the Board of Military Affairs, on August 12, 1935, by Saburo Aizawa, Lieutenant-Colonel on the active list, was a turning moment for the general policy of the War Ministry. Aizawa was one of the group of officers who were associated with the May 15 affair of 1932. General Hayashi's place was taken by General Kawashima as War Minister in September and the general policy of the War Ministry naturally swung back to the former one.

Dissolution of the House There were many predictions, and hopes in some cases, entertained as to the relation of the Cabinet and the Seiyukai, the Opposition, from the end of 1935 to the beginning of 1936. But the hopes entertained toward effecting a possible understanding remained unrealized and the Seiyukai hardened its front more and more towards the cabinet. Okada, thereupon, asked H. I. M. the Emperor to dissolve the House of Representatives, which was done on January 21, 1936, and it was declared that a general election would be held on February 20.

The strengths of political parties in the House of Representatives at the time of dissolution were as follows :

Total Number of Seats	466
Seiyukai	242
Minseito	127
Kokumin Domei	20
Showakai	24
Social Mass Party	3
Independents	11
Vacancy	39

General Election The 19th General Election was held on February 20, 1936, with the number of eligible voters totalling 14,479,553 and 878 candidates for 466 seats. The warcry of the General Election was "Pure Election". The Government took a mean attitude toward the whole aflair of election, and the result was :

THE 19th GENERAL ELECTION, FEBRUARY 20, 1936

(As it stood on February 24)

Number of Seats in the House of Representatives	466
Number of Voters	14,479,553
Number of Candidates	878
Collective Votes	11,117,116

According to Parties:

	Candidates	Elected	In January	Increase or Decrease	Votes Obtained	%
Seiyukai	336	174	242	−68	4,156,643	37.4
Minseito	296	205	127	+78	4,456,250	40.1
Kokumin Domei	33	15	20	− 5	401,261	3.7
Showakai	49	20	24	− 4	523,663	4.7
Social Mass	30	18	3	+15	518,360	4.6
Other parties	33	9	0	+ 9	285,670	2.6
Independents	101	25	11	+14	775,269	6.9
Total	878	466	427	+39	11,117,116	100.0

The defeat of the Seiyukai which had held an absolute majority in the House was unexpected, as was the great advancement of the Social Mass Party. Reasons were complicated and no final inference can be drawn from the result. But this much was clear that the general demand for a radical change in the country's politics so as to insure and advance the welfare of the mass is reflected in the return of 18 members of the Social Mass Party.

Political Affairs in 1936 and 1937

February 26 Incident

The Cabinet was anything but displeased with the result of the election, for it had brought about the defeat of the Seiyukai. But an event unprecedented in the history of the country since the Restoration of 1868 was in store for it. Early on the morning of February 26, 1936, over 1,480 soldiers rose against it and the high officials, and assassinated Admiral Makoto Saito, Grand Keeper of the Imperial Seals, Korékiyo Takahashi, Finance Minister, and Lieutenant-General Jotaro Watanabé, Inspector-General of Military

Digitized by Google

Education, and seriously injured Admiral Kantaro Suzuki, Grand Chamberlain, at their residences.

Martial law was immediately put into force for a part of Tokyo surrounding the Imperial Palace under the command of Lieutenant-General Kohei Kashii. (For a full account of the Incident see the Japan Year Book, 1937, pp. 135–143.)

Formation of the Hirota Cabinet

Admiral Okada and other members of the Cabinet tendered their resignations to the Throne on February 27, taking full responsibility for the Feb. 26 Incident. Prince Saionji was called to Tokyo for his advice in the matter of choosing the succeeding premier. Prince Konoyé, President of the House of Peers, was first recommended, but he asked for Imperial pardon because of his weak health. Then, on March 5, Koki Hirota, Foreign Minister in the Okada Cabinet, was summoned to the Imperial Palace and he accepted the Imperial Order to form a new Cabinet.

The formation of the Hirota Cabinet met difficulties on its course, but was finally completed and the inauguration took place on March 9, 1936.

The first announcement of the new policies of the Hirota Cabinet was made by Dr. Eiichi Baba, Minister of Finance, on March 9, to the effect that the old financial policy of the late Finance Minister Takahashi would not be proceeded with, but as one of the new policies of the cabinet, the Finance Ministry was planning an increase of revenue from taxes and an enlarged floatation of national loans in connection with the budget for 1937–38 in order to meet the increased demands necessitated by changes of the times.

The statement of Prime Minister Hirota, published on March 17, 1936, on the policy of the new Government, rather disappointed the general public with its too reserved and abstract wording, but his intention to follow a central course was well pronounced in the words "over-hasty actions will be avoided through the wisdom of the people and a thorough understanding of the public sentiments."

Imperial Diet, 69th Session The 69th Session of the Imperial Diet was convened on May 1, 1936 and closed on the 27th of the same month. Kojiro Tomita of the Minseito was elected President of the House of Representatives, and the formal opening ceremony was held on the 4th of May in the presence of His Majesty the Emperor, who gave the Imperial Message as follows:

We hereby conduct the ceremony opening the Imperial Diet and so announce to the members of the House of Peers and the House of Representatives.

We rejoice over the fact that the relations of the Imperial Government and foreign nations have been becoming steadily more cordial.

We regret the outbreak of the recent incident in Tokyo. It is expected of Our faithful subjects that they will unite as one, Government and people, civilians and military, in order to promote the development of the national fortunes.

We have ordered the Ministers of State to present to the Imperial Diet the urgent supplementary budget bill and other measures.

It is expected of you that you will deliberate upon them in harmony, thereby fulfilling Our wishes.

The reference to the February 26 Incident in the Imperial Message strongly touched the hearts of the members of the Cabinet and both Houses and the session was carried out in a most serious attitude of mind all through the three weeks. On May 6, Premier Hirota, Foreign Minister Arita, Finance Minister Baba and War Minister Terauchi made speeches on the general policies and what they were planning for the improvement and readjustment of the matters specially coming under their respective jurisdiction. Important points in their speeches related to the strained international relation between Japan and the U.S.S.R., the increase of revenue from taxation and the determination of the authorities to enforce discipline in the Imperial Army. The War Minister gave a full explanation concerning the Feb. 26 Incident to the members of both Houses in a closed meeting on the 7th May and the searching interpellation of Takao Saito of the Minseito at the general meeting of the House of Representatives on the same day drew the keen attention of the House and members of the Cabinet and caused a sensation among the public, gaining the full support of the press.

Many important bills awaited the decision of the Diet in this short 69th Session, such as supplementary budgets, the autonomous rice control bill, the rice control law revision bill, the joint unhulled rice storage subsidy bill, the cocoon disposal control bill, the bill to revise the silk manufacturers' guild law, the bill to revise the silk industry law and the important fertilizer control bill, all of these pertaining to the welfare of

Digitized by Google

the agricultural communities, the shipping business control bill, the bill for the establishment of two companies to aid the rehabilitation of the north-eastern districts, the bill for the establishment of a central bank for commercial and industrial guilds, the seditious literature restriction bill, the national mobilization secrets protection bill, and the workers' discharge reserve fund and allowance bill. The supplementary budgets (given in full in the Japan Year Book, 1936, pp. 237-280) passed both Houses without amendment. As to the workers' discharge reserve fund and allowance bill, hot discussions arose from both the sides of capital and labour, but the bill was finally passed after important amendments had been made to make it applicable only to factories and mines with 50 or more workers and to make the discharge allowance less than 3 per cent of the wages paid up to the time of discharge. The bills in connection with rice control were presented to the Diet to settle the long debated problems started with the presentation of similar bills which had been laid on the table at the 67th Session in 1935 after a desperate fight between farmers and merchants. This time they just got through both Houses with a conditional clause added to the original. The seditious literature restriction bill passed with important amendments to restrict the scope of its application and changing the name of the law into the seditious literature temporary restriction law. The Houses passed all the 46 bills presented by the Government in addition to the budgetary bills and over 150 memorials and resolutions, with the exception of the national mobilization secrets protection bill which was laid on the table because of the danger of its restricting the freedom of the people.

Important Policies of the Hirota Cabinet The much talked about new policies of the Hirota Cabinet met with difficulties before being finally decided upon. A part of the Government insisted on the separation of the defence policies and the general policies, the greater importance to be placed on the former, while the other part required the realization of numerous political, social and economic measures to fulfil the special mission of the Cabinet and to answer the expectations of the people, who wanted something in the way of a reformation after the precious sacrifice of the Feb. 26 Incident.

Important policies and new measures heaped up on the table of the Cabinet meetings in such numbers that discussion on them became impossible in the limited time of the usual meetings, so after preliminary selection and study, a Cabinet meeting to consider important national policies was held on August 25, 1936, when it decided on and published the following 7 national policies :

(1) Completion of National Defence ; (2) Improvement of the Educational System ; (3) Readjustment of National and Local Tax Systems ; (4) Stabilization of the Living of the People by a more effective prevention of natural disasters, completion of health protection, further economic measures for helping villagers and city merchants and manufacturers of small means ; (5) Promotion of Industry and Expansion of Foreign Trade by the increase and control of electric power, self-supply of liquid fuel and iron and steel, full supply of materials for the fibre industries, aid and control of foreign trade, encouragement of aviation and sea transportation businesses and encouragement of emigration ; (6) Establishment of important policies with regard to the relation of the Empire with Manchoukuo such as the emigration of Japanese to Manchoukuo or the greater investment of the Japanese capital in that country ; (7) Improvement or Reformation of the Administrative System.

Advance to the National Control of Economics The financial policy of the Hirota Cabinet advanced to the national control of important economic organs and industrial enterprises. The phrase "Quasi-wartime economic system," which was frequently used by the Financial Minister and journalists in the latter half of the year, well voiced the Government's intention for national economic control. The control cannot be said to be as thorough as that in Fascist countries, but it entered in no small degree into the free commercial and industrial fields in 1936. The first aim of this economic control was the completion of national defence, the second was the remedying of the defects of individualistic capitalism and the third was the establishment of an economic policy of self-sufficiency along with the world tendency of forming economic blocs. From the outset, the Hirota Cabinet took as its first mission the strengthening of national defence although it did not by any means try to destroy the existing capitalistic economic system or reject the old principle of commercial freedom, but it purported to effect a peaceful change

Digitized by Google

in the economic system of Japan, beginning with those enterprises the control of which was an acute necessity for the betterment of the life of the people and the strengthening of defence.

Among the bills which were put by the Government before the 69th session of the Diet and which passed both Houses, were many which aimed at this betterment of the life of the people and the strengthening of defence, for instance, the Rice Control Law, the Cocoon Disposition Control Law, the Important Fertilizers Business Control Law, the Important Commodities of Trade Control Law, the Automobile Manufacturing Business Law, the Revised Industrial Control Law, and the Navigation Control Law. These laws had been planned by former cabinets so were not the legitimate offspring of the Hirota Cabinet control ideals, but they passed into law because of the Diet's desire to strengthen economic control to meet the quasi-wartime needs.

Sino-Japanese Issue On August 24, 1936 a Chinese mob attacked four Japanese at Chengtu, Szechwan province, killing two newspaper correspondents and seriously injuring the other two. This event aroused the indignation of the whole Japanese nation as similar misdeeds against Japanese subjects in China had become rather frequent. Negotiations between the Japanese envoys at Nanking and Chinese Foreign officials for the peaceful settlement of these matters were becoming a daily feature.

The Japanese Government and people took the occurrence of these regrettable incidents as a natural outcome of the anti-Japanese education and policy of the Nanking Government. The recurrence of such incidents could not be prevented, the Japanese inferred, by a mere proclamation of the Chinese Government enjoining on Chinese people to behave in a more friendly manner toward the Japanese. The Japanese Government seemed rather too cautious, while the public opinion in Japan was strong enough to back the Government in taking any aggressive measures on China. The Nanking Government took a negative attitude all through and, taking advantage of the East Suiyuan issue at the end of the year, communicated to the Japanese representatives that it would be difficult to bring the Nanking negotiation to a successful conclusion so long as the East Suiyuan question was not settled, and assumed an attitude threatening to repudiate all agreements so far reached. The final outcome of all conversations between the representatives of the two Governments, which had extended over three months, was the visit of Ambassador Kawagoe to Mr. Chang Chun, Chinese Minister for Foreign Affairs, on December 3, 1936 when a note embodying points on which agreement had been reached was handed him, and the Nanking parley entered a holiday, both sides publishing statements contradicting each other.

The Sino-Japanese issue in the last three months of 1936 left the final solution to a later occasion. The Japanese press and the people as a whole were not satisfied with the activities of the authorities concerned with the issue, considering their attitude as disclosing weakness on the part of the Hirota Cabinet and taking, on the other hand, the unfriendly attitude of the Nanking Government so heavily to heart that another crisis between the two nations seemed likely at any moment.

Control of Electric Power Control of electric power in Japan by the Government was included in the items of the seven national policies set out by the Hirota Cabinet as mentioned elsewhere and became one of the most important subjects of discussion in industrial and commercial circles. The plan was representative of the national control of all economic enterprises and the existing electric companies were necessarily opposed to it as against their interests, and the economic world condemned it as being contrary to the principle of commercial freedom and a kind of public robbery of another's property because under the plan it was intended to purchase compulsorily all the facilities and equipments of the companies at a price estimated by the Government. Heading the criticism of the plan the Ministry of Communications, the compiler of the bill, made amendments to the first plan, but the main difficulty lay in the value of the fixed assets of the power companies which were capitalised aggregately at over ¥800,000,000, besides which much doubt was entertained as to the practical result of the control, which aimed at the lowering of the price of electric power. The presentation of the bill to the 70th session of the Diet at the beginning of 1937 was therefore postponed and the question left over for the decision of the succeeding Konoé Cabinet.

Japan-German Agreement In cognizance of the fact that the object of the Communistic International, or the so-called Comintern, is the disintegration of existing States recognized by it as

Digitized by Google

Imperialistic or capitalist, and that its interference in the internal affairs of nations not only endangers their internal peace but threatens international peace, and desiring to co-operate for defence against communistic disintegration, Japan and Germany agreed, on November 25, 1936, on a mutual exchange of information concerning the activities of the Comintern, confer upon necessary measures of defence and carry out such measures in close co-operation.

Positive Attitude of Political Parties

The 70th session of the Imperial Diet was convened on December 24, 1936, to sit for three months ending with March 25, 1937. The difficulties of the Hirota Cabinet were expected to arise over the Tax Increase Bill, the Electric Power State Management Bill and the Compulsory Education Prolongation Bill and it was felt that the Government must exert itself to overcome the antagonistic forces represented by many members of both Houses. To make the matters worse, there was a dissatisfaction at the foreign policy of the Government in general and a still smouldering complaint at the Government's attitude towards the political parties.

From what transpired at the meetings of the political parties preparatory to the 70th session of the Diet it was revealed that the parties were going to take a much more positive attitude in the discussions in the coming session of the Diet than they had been wont to do in former sessions. The Imperial edict at the opening of the 69th session called forth the sense of responsibility anew, not only among Governmental circles but also among party men, and the latter began to pay closer attention to the doings of the Hirota Cabinet. They were expected to enter into hot discussions over many drastic measures to be taken by the Government for political, economic and educational renovation discordant, in their eyes, to the present state of national progress, together with evident failures in the handling of international affairs by the Government.

The 70th Session of the Imperial Diet

The 70th session of the Imperial Diet, convened on December 24, 1936, was of great import to the Hirota Cabinet, which had been formed to cope with the grave state of national and international affairs and the February 26 Incident and which was now to ask the judgement of the nation concerning its plans and administration for the first time, because the 69th session had been a short and extraordinary one. There was a fresh expectation in general for the session because it was to be held for the first time in the new and permanent edifice of the Imperial Diet Building which had been completed in November, 1936.

Before the formal opening of the session the political parties held their general meetings and gave voice to what they thought of the general situation and their attitude towards the Government.

The Miniseito published its statement, saying, "The present state of national and international affairs in Japan calls for the fundamental reformation of international policies and administration of national affairs. But what the present Government is doing is far from their promise for the reformation of national administration thus causing a general unrest in the banking and industrial circles and deepening the economic depression among the working classes in urban and country districts alike so that the whole nation is put on the verge of an outbreak of thought confusion, while the foreign policy of the Cabinet has brought about a standstill of diplomacy between the country and Russia, China or Great-Britain, because of its inability to establish a stable diplomatic policy." The Seiyukai put emphasis on the effective activities of the Imperial Diet as an organ representing the mass of people in answer to the Imperial wish for discussing important matters with the subjects, calling special attention to the new taxation policies of the Government and its wavering diplomatic policy concerning matters pertaining to the welfare of the Oriental countries. The Social Mass party passed decisions on waging war, against the oppression of the Government of the Governmental labour unions, on a movement for the institution of the Trade Union Law and Tenant Law, on free discussion in the Diet, on the Budget, the revision of the tax system, the reformation of the governmental system, the revision of the Election Law and the control of the electric power business, and on the realization of a diplomatic policy in accordance with the wishes of the people, evincing their anti-Fascist political ideas.

The Kokumin-Domei	12
The Tohokai	9
The Social Mass Party and Local Proletarians	21
Other small groups	18
Independents	4
Vacant seats	1
Total	466

The general atmosphere at the opening of the 70th session of the Diet suggested a strong attitude of the leading political parties against the policies of the Government, especially against the lukewarm Arita diplomacy. But the collision between the House of Representatives and the Hirota Cabinet occurred on January 21 in connection with the interpellation of Mr. Hamada and the answer of Lieutenant-General Terauchi, War Minister.

Resignation of the Hirota Cabinet The Hirota Cabinet tendered its resignation en bloc to the Throne on January 23, 1937, after two days extraordinary adjournment of the Diet. The events surrounding the formation of the succeeding Cabinet revealed many facts important to Japan's history of politics and gave valuable suggestions concerning the future of the constitutional government of Japan.

The cause of the resignation of the Hirota Cabinet appeared to be in the apparent dissension between the Cabinet and the political parties and the lack of the Premier's earnestness in pushing his policies bacause of the weakening support of the military.

Premier Hirota's attitude toward the 70th Session of the Diet was rather negative. Criticism of the diplomatic failure of the Hirota Cabinet in general and the discouraging atmosphere regarding the important bills and budget before the meeting of the Diet was such that it was expected that the political parties would force the resignation of the Government. Both the Minseito and the Seiyukai were represented by two members in the Cabinet, yet their attitude towards it became worse with the approach of January 21 when the 70th session of the Diet was to begin its business. Premier Hirota took no measures to better his position, and made no visit to the presidents of the leading parties to get their understanding as to the standpoint of the Government. It is usually understood, in such a case, that the Government is aggressive and disregards the co-operation of the political parties. But it was not so in Hirota's case, for he easily yielded to the adverse situation and handed in his resignation after but two days' deliberation, in spite of all surmises in political circles that there might come either a dissolution of the House of Representatives, or the Government would manage matters so as to get through the 70th Session and resign, if necessary, after the session, and after having made full preparations for the quick succession of a new cabinet.

The hot words exchanged between the War Minister and Mr. Kunimatsu Hamada on January 21 were too insignificant to be the cause of the resignation of the Hirota Cabinet, but the Army was unwilling to discuss matters any further with the party men in the House of Representatives, not because of the alleged insult of Mr. Hamada against them but for the reason that there was a difference of opinion between the Army and members of the House of Representatives in regard to the recognition of the seriousness of the situation which Japan was thrown into judged from the declarations of the leading parties at their general meetings and the move of the party men in the Houses. The Army insisted upon an immediate dissolution of the House of Representatives. Mr. Hamada and his party found no reason for making an apology on what he had said in his interpellation although the general atmosphere among the parties seemed to be towards a compromise.

Opinions were divided among the Cabinet members as to the dissolution of the House of Representatives and Navy Minister Vice-Admiral Osami Nagano and Dr. Gotaro Ogawa, Minister of Commerce and Industry, took the trouble to try and arbitrate between the dissenting parties in and out of the Cabinet. Dr. Ogawa belonged to the Minseito and was anxious to bring the matter to a satisfactory conclusion in order to get the budget passed by the Diet, seeing that parties were not actu-

Digitized by Google

ally opposed to it, and to save his comrades from the blow of dissolution. Vice-Admiral Nagano found no reason for a deadly clash between the Government and the Lower House in the quarrel of the War Minister and Mr. Hamada, and was gravely concerned about the passage of the budget, which was threatened with postponement for at least half a year by the possible dissolution, for the Navy wanted to hasten the completion of its programme with the coming of the first year of freedom from treaty disarmament. The two Ministers had a consultation and the Minister of the Navy called on the Presidents of the Minseito and Seiyukai on the night of January 22 and early in the morning of the following day, and got the full understanding of the two Presidents.

But all the efforts of the Ministers proved futile. The Army took a firm stand and handed the resignation of the War Minister Lieutenant-General Terauchi to the Premier by the morning of the 23rd, evincing thereby the uncompromising attitude of the Army on the issue.

Premier Hirota did not give his consent to the asking of the Throne for the dissolution of the Lower House, but, on the contrary, decided on his own accord to give up all measures for maintaining the life of the Cabinet. He probably saw it useless to push the matter any further. He saw that the support of the circles who wanted a quick and drastic renovation of the political and economic systems of Japan had become weak because of their dissatisfaction at his too cautious way of handling important matters. Besides, the movements in political circles, public and secret, had suggested that some schemes for the change of the Government had been going on. As a matter of fact several propositions for the establishment of a new political party continued to appear in the press in preparation for the bringing about of a new Cabinet. On January 23, 1937, Premier Hirota announced his reason of resignation to the effect that since assuming the duties of Premier by imperial Order in March, 1936, he had done his best for the proper administration of state affairs, but in spite of all his efforts the difficulty of the political situation had become an unsurmountable obstacle.

On the same day the War Minister published his statement in regard to his stand on the matter. "Mr. Hamada's address in the House is not to be taken as the reason of my resignation. It is true that leading parties have their members in the Cabinet, but in spite of this fact, their declarations and presidents' addresses at their general meetings before the opening of the Diet, the interpellations of their representatives on the 21st of January, and the general atmosphere of the House of Representatives on the same day clearly indicate that there is a great gap between the understanding of Japan's present situation, national and international, by the Army and by the political parties. It is hard, in my opinion, to surmount the difficulties before us by a temporary compromise unless we all come to the right recognition of Japan's real situation. The existing state of affairs leads me to the conclusion that they are against my hope for the strengthening of military discipline, completion of national defence and renovation of state administration."

Ugaki's Failure General Kazushige Ugaki who had been enjoying a quiet life for years at Nagaoka, Shizuoka prefecture came up to Tokyo on January 25, 1937, and was granted an audience and received Imperial order to form a cabinet, and then began his task, first to get War and Navy Ministers. But he met with strong antagonism from the Army which answered that no high officers were willing to be recommended to the portfolio in spite of the combined efforts of the Chief of the General Staff, the War Minister and the Inspector-General of Military Education. Ugaki was supported by almost the entire press and majority of people, who sent him thousands of letters and telegrams of encouragement to fight against the adverse situation in which he was quite unexpectedly put. It was impossible for him, however, to choose the War Minister without the recommendation of the three just mentioned because of the regulation that limited the post to a General or Lieutenant-General in active service, the number of these being very small and all of them being under direct control of the Ministry.

Many suggestions were proposed to General Ugaki as extraordinary means of accomplishing his purpose, but he did not like to take any drastic measure in face of the apparent antagonism because of the peace of the country, and after five days' deliberation and negotiations, that is, on the 29th, he gave up his task and asked the pardon of the Throne for his inability to form a Cabinet.

The Birth of the Hayashi Cabinet

Whereupon, Mr. Yuasa, Grand Keeper of the Imperial Seals was sent to the

Genro, Prince Saionji, who recommended, this time, first, Baron Kiichiro Hiranuma, President of the Privy Council, and, second, General Senjuro Hayashi. The first candidate declined and General Hayashi was called to the Palace and was ordered to form the Cabinet.

The birth of the Hayashi Cabinet was premature for it consisted of but eight members instead of thirteen. The eight were :

Premier, Minister for Foreign Affairs and Minister of Education,	General Senjuro Hayashi
Minister for Home Affairs,	Mr. Kakichi Kawarada
Minister of Finance and Minister for Overseas Affairs,	Mr. Toyotaro Yuki
Minister of War,	Leutenant-General Kotaro Nakamura
Minister of Navy	Vice-Admiral Mitsumasa Yonai
Minister of Justice	Mr. Suehiko Shiono
Minister of Agriculture and Forestry and Minister of Communications,	Mr. Tatsunosuké Yamazaki
Minister of Commerce and Industry and Minister of Railways,	Engineer Vice-Admiral Takuo Godo

Dissolution of the House of Representatives The 70th Session of the Imperial Diet which had been convened on December, 24, 1936, was closed on March 31, 1937, with the Dissolution of the House of Representatives. The session was a very extraordinary one, for, during its sitting, the Hirota Cabinet resigned and the Hayashi Cabinet came into power. It adjourned three times, at the end of January and in the beginning of February, on account of the change of the Cabinet, and at the end of March it was prolonged for 6 days beginning with the 26th and finally on the last day it met the Dissolution. All through the Cabinet, both old and new, was unsympathetic with the parties in the House of Representatives, while parties, on their part, took a negative and equivocal attitude toward these governments as a whole, although some of their members were brave enough to make attacks on the movement of a part of the Imperial Army or Government's social policies.

The Dissolution was also peculiar. The Diet was closing on March 31 in peace, hurriedly passing resolutions and bills left over to that day, 49 important bills including the budget for 1937-38 being voted already, when it all of a sudden was dissolved to the surprise of the members of the House of Representatives and the general public.

The Government stated concerning the reason of the Dissolution as follows :

To cope with prevailing conditions at home and abroad, surmount the current difficulties and promote the national fortunes, co-operation between the Government and the people in the proper sense is absolutely essential. Thus the Cabinet, though it had just been formed, sought in the present session of the Diet the passage of many bills in all sincerity. The manner in which the Lower House has discussed these bills, however, has been extremely lacking in earnestness, with the result that proceedings have been blocked with regard to important bills having the greatest bearing on national defence and stabilization of the living of the people, urgent business held up and doubts aroused as to whether parliamentary discussion could be carried on further in the way required by the seriousness of the prevailing situation.

We therefore saw much reason in the clamour for renovation of the Diet. In the hope of appealing to the just conscience of the people, submitting to the will of the people and making manifest the principles of the constitutional government of Japan, and at the same time in expectation of sound political awakening on the part of the people and co-operation between them and the Government in surmounting the present serious situation, we have petitioned the Throne for dissolution of the House of Representatives.

The 20th General Election

Results of the General Election in April, 1937 Of the total 122 election districts not one was carried complete by either the Minseito or the Seiyukai, the two leading parties. On the contrary, the number of districts in which all the candidates of these parties were defeated was 13 for the Minseito and 7 for the Seiyukai, due largely to the rise in the power of the Social Mass Party. The following tables, compiled by the Asahi, show the ups and downs of the political parties at the election :

The general election of April 30, 1937, was carried out without a clearer aim than that of the Government, which asked for the "repentance" of the House of Representatives because its behaviour had been unsatisfactory in the eyes of the Cabinet and the election was the outcome of the Dissolution brought about by its behaviour. It was neither a fight between the Government and the parties around important issues nor an election of confidence on Government's policies. In any case, the results of the election were entirely against the Government. The victory of parties whose platforms were decidedly against the Government was overwhelming, and the combined forces of the Minseito and the Seiyukai in the Lower House kept the absolute majority as it was in March. The number of the representatives sent by the Social Mass Party, which was most strongly opposed to the Government's political ideas, was nearly doubled. On the other hand, the number of the representatives of the Showakai, the ministerial party, was reduced from 24 to 18 and another pro-governmental party the Kokumin-Domei gained nothing, while the independents who were in sympathy with the Government sent but a few members to the new House of Representatives. All the efforts of the Government to turn the results to its benefit were defied. The general election presented the people with a chance of expressing their deep concern with the political affairs of the country and the bustle of the election which had been thought meaningless by many at the outset gave birth to many points suggestive of the future of the Imperial Diet. The first of them was that the voters did not sympathize with the political ideas destructive of the existing parliamentary system, the second was that they showed a strong opposition against the attitude of the Government which seemed to fill the political stage to the exclusion of others, and the third was that they expressed their earnest wish for the renovation of the Diet in the votes that went to the Social Mass Party.

Voting Analysis According to the Local Bureau of the Home Department, which has been investigating the voting at the 20th general election of April 30, 1937, the percentage of absentees increased by 5.4%, being 26.7 against 21.3 at the previous election, and in the comparison of invalid votes, blank votes increased by 2,012 and voting papers on which were written miscellaneous things increased by 3,682, while on the whole the total number of invalid votes decreased by 2,779.

	The 20th General Election (April 30, 1937)	The 19th General Election (February 20, 1936)
Total number of electors on the election day	14,075,010	14,303,780
Number of voters	10,317,756	11,249,663
Absentees	3,757,254	3,054,118
Percentage of absentees	26.7	21.3
Total number of valid votes	10,203,677	11,132,677
„ „ „ spoilt votes	114,040	116,819
Blank votes	13,130	11,118
Voting papers containing miscellaneous written matter.	25,101	21,419
Others	75,809	84,282

Advance of the Social Mass Party One of the most outstanding results of the 20th general election of April 30, 1937, was the advance of the Social Mass Party. The party gained 18 seats more than it did at the 19th general election of February 20, 1936, and obtained 382,556 more votes. A comparison of the three largest parties at the two general elections follows :

RESULTS OF THE 19TH AND THE 20TH GENERAL ELECTIONS

Parties	19th Election	20th Election	Percentage of Increase (+) or Decrease (−)
Minseito			
No. of persons elected	205	179	− 12.5
No. of votes obtained	4,456,250	3,666,067	− 17.7
Seiyukai			
No. of persons elected	174	175	+ 0.5
No. of votes obtained	4,156,643	3,608,882	− 13.1
Social Mass Party			
No. of persons elected	18	36	+100.0
No. of votes obtained	518,360	900,916	+ 73.8

In many important election districts in Tokyo, Osaka, Kyoto and Kobé, candidates of the Social Mass Party obtained the largest number of votes. It was said that a large number of votes went to the party not only from labourers and farmers but also from well-educated people, small traders and industrialists, and even from Government officials.

Premier's Statement On May 3, Premier General Hayashi published a statement in connection with the result of the 20th general election as follows : Japan's political situation, national and international, is critical to the utmost extent. To surmount the crisis there is no other way than to aim at a radical reform in all directions, discarding conventionalism and yet not overrunning the times. With this conviction the Government worked with the 70th Session of the Imperial Diet and came to realize that the renovation of the constitution of the Diet is one of the important things basic for the reform of all other organs of State, being the first step of realizing the principles of Imperial constitutional government. I humbly asked the Throne for the Dissolution of the House of Representatives after a careful deliberation of these points, apart from the success or failure of the Government's policy in this respect. The 20th general election was carried out fairly. We expect the new representatives of the people to sacrifice their self-interest and to be eager to serve H.I.M. the Emperor in the momentous work of realizing the ideals of the Foundation of the Country in accordance with the principles of the national polity, in helping the progress of our unique constitutional government and in making contributions to the Imperial régime fully versed in the present political situation of Japan. This is what the whole nation expects of them. The Government is determined to carry on faithfully its policies indispensable at this time with the conviction and expectation stated above. We earnestly require the full co-operation of the people and their whole-

Digitized by Google

hearted sympathy with the intention of the Government.

This statement was received by the public as voicing the Government's determination to carry on its mission in the face of all criticism none of which supported the Government's stand. The unanimous opinion was that the Government would have to retreat in a few months, either before the proposed extraordinary session of the Diet in August or at its beginning when a non-confidence decision would be passed by a unanimous vote.

Resignation of the Hayashi Cabinet

In spite of the Premier's statement matters went from bad to worse for the Hayashi Government. Movements for the formation of a new ministerial party all failed, while the much talked about disruption, if there had been any possibility of one, of the existing large parties was checked by the Dissolution and the general election, for these events worked contrary to the hope of the Government for bringing about such a disruption and strengthened the unity of political parties in their common fight against the Hayashi Cabinet.

The general state of political affairs and the trend of public opinion in May tied up Hayashi's hand in trying to get persons for the vacant ministerial chairs. Besides, secret movements for a new cabinet began to be more active, along with the public movements and decisions of leading parties for the downfall of the Hayashi régime.

On May 31, 1937, the resignation of the Hayashi Cabinet en bloc was finally announced.

Konoé Comes to Power

The public nomination for the new Premier was Prince Fumimaro Konoé, President of the House of Peers. The Imperial wish was the same, for the Genro, Prince Saionji, the President of Privy Council Baron Hiranuma and the Grand Keeper of the Imperial Seals Mr. Yuasa unitedly recommended Konoé to the Throne on the first of June, 1937. Late in the afternoon, Prince Konoé was granted an audience in the Imperial Palace and received the Imperial Order for the formation of a new cabinet.

Konoé's coming to power was welcomed by all circles in Japan. His family prestige is second to none among the Japanese subjects, his political career as the President of the House of Peers has been brilliant, and his knowledge of and sympathy with the conditions of the people as well as his understanding of military issues is thought to be deep and thorough. He is young, being 46 years old, and has but one defect, that of physical weakness.

The formation of the new cabinet went on smoothly in favourable circumstances. Prince Konoé was successful in the first place in persuading the War and Navy Ministers to stay in their former chairs, then in bringing Dr. Eiichi Baba, Minister of Finance in the Hirota Cabinet, to the chair of Home Miniter, and finally in getting Mr. Koki Hirota, the former Premier, for the Foreign Affairs portfolio. According to his policy of forming a cabinet in which all the political forces are represented, Prince Konoé was able to get one Minister from each leading party, Mr. Ryutaro Nagai, Chief Secretary of the Minseito, to be Minister of Communications, and Mr. Chikuhei Nakajima, one of the four members of the Acting-Presidential Board of the Seiyukai,to be Minister of Railways.

The Konoé Cabinet was formally inaugurated in the presence of His Majesty the Emperor at the Phœnix Hall of the Imperial Palace, at half past three in the afternoon of the fifth of June, 1937. The 13 members of the Konoé Cabinet were :

Premier,	Prince Fumimaro Konoé, President of the House of Peers
Minister for Foreign Affairs,	Mr. Koki Hirota, M.H.P., former Premier
Minister for Home Affairs,	Dr. Eiichi Baba, M.H.P., former Minister of Finance
Minister of Finance,	Mr. Okinori Kaya, former Vice-Minister of Finance
Minister of War,	General Gen Sugiyama, who held the same portfolio in the Hayashi Cabinet
Minister of Marine,	Admiral Mitsumasa Yonai, who held the same portfolio in the Hayashi Cabinet
Minister of Justice,	Mr. Suehiko Shiono, who held the same portfolio in the Hayashi Cabinet
Minister of Education,	Mr. Eiji Yasui, Governor of Osaka Prefecture

Digitized by Google

Minister of Agriculture and Forestry,	Count Yoriyasu Arima, M.H.P., Chairman of the Board of Trustees of the Central Chest for Co-operative Societies
Minister of Commerce and Industry,	Mr. Shinji Yoshino, former Vice-Minister of Commerce and Industry
Minister of Communications,	Mr. Ryutaro Nagai, M.H.R., Chief-Secretary of the Minseito
Minister of Railways,	Mr. Chikuhei Nakajima, M.H.R., Member of the Acting-Presidential Board of the Seiyukai
Minister for Overseas Affairs,	Mr. Sonyu Ohtani, M.H.P.

The new Cabinet came into power with the full support of the press, the military circle, the leading political parties and the economic world. It was believed that the Konoé Cabinet intended to make all efforts to overcome the quasi-wartime crisis by the united force of the defence services, the bureaucracy and the political parties, keeping harmony with military forces and heeding the wishes of officialdom. The economic policy of the Cabinet was to adjust the international payments of Japan, to establish a concrete programme for the development of productive power in the country and to get a clear prospect of demand and supply and control the relations of the two most effectively.

Birth of a New Party The formation of a party, either entirely new or by the amalgamation of radical elements in the Minseito and the Seiyukai or by the supposed disruption of the Seiyukai, had been much talked about in the last two years. But, the unity of members of these two leading parties was much stronger than was supposed by many, and became much more so after the dissolution of the House of Representatives in March, this year. Therefore, eminent figures in the political world who it had been presumed would assume the presidency of the new party made no move in that direction.

In the meantime, the Seiji Kakushin Kyogikai or the Political Reform Council began a movement for the formation of a new party, and held, on July 8, a preparative meeting of ten committee men including Genkuro Eto, Katsumaro Akamatsu, Shiro Koiké and Tsunekichi Yamazaki. At the meeting it was decided that the name of the new party should be the Nippon Kakushinto (the Nippon Reform Party), and programmes were prepared for holding the inaugural meeting on the 18th at the Shiba Kyocho Kaikan (Shiba Hall of the Capital and Labour Harmonizing Council) and for beginning activities with a lecture meeting to be held on the 21st at the Hibiya Public Hall.

The proposed general meeting for the organization of the Party was held as scheduled, when representatives of member bodies gathered together from all parts of Japan including the four members of the House of Representatives, Genkuro Eto, Katsumaro Akamatsu, Shiro Koiké and Tsunekichi Yamazaki. The meeting passed decisions on the general principle and policies of the party as follows:

General Principle. The Nippon Kakushinto aims at the manifestation of the true Nippon in accordance with the principle of her national polity.

Policies (1) The establishment of a constitutional government and administrative system unique to Japan; (2) the establishment of a national planned economy based on its unification through peace and war times; (3) the unification of industry and economy in Japan and Manchoukuo; (4) the establishment of fundamental readjustment policies for national and local finances; (5) the completion of the provisions for national defence and the programme of national mobilization; (6) the establishment of an international policy in accordance with Imperial Justice; (7) the establishment of an educational system and means in accordance with Japanese principles; (8) the re-establishment and creation of national culture in accordance with Japanese principles; (9) the institution of measures for the elevation of the national physical standard; and (10) the establishment of policies for the relief of poverty-stricken people.

Officials of the party were appointed as follows: Chairman of the General Committee, Genkuro Eto; Chief for the Party Affairs, Katsumaro Akamatsu; General Committee, Shiro Koiké, Tsunekichi Yamazaki, Itcho Sasai, Tatsuo Tsukui, Kyuzo Takayama, Hyozo Kanda, I. Ishibashi and Katsumaro Akamatsu; Chief of the Policy Investigation Council, Itcho Sasai.

The 71st Session of the Imperial Diet

The 71st extraordinary session of the Imperial Diet was convened on 25th of July, 1937, the opening ceremony being honoured by the presence of H.I.M. the Emperor.

The addresses of the Premier, the Minister for Foreign Affairs and the Minister of Finance were delivered at the general meeting of both Houses on the 27th.

The minute reports of the North China Incident made by the War Minister, General Gen Sugiyama, before the Diet on the same day and on several other occasions held the attention of the audience, and the Diet gave consent to the Government's request for the second supplementary budget in relation to the North China Incident which reached ¥419,600,000, without any amendment.

The 71st Session of the Diet passed two bills presented by the Lower House and the 34 bills introduced by the Government, including budgets for the Incident and for the establishment of the Ministry of Health and Social Affairs. Only one bill was laid on the table. The closing ceremony was held on the 8th of August, 1937.

The Board of Planning The Imperial Ordinance authorizing the formation of the Board of Planning, and ordering the abolition of the Board of Investigation, was promulgated on May 14, 1937. On the same day, the new Board embarked on its important mission with the appointment of a President, a Vice-President, and other officials.

According to Article I of the Ordinance the functions of the Board are

(1) To make recommendations to the Cabinet, acting on the instruction of the Prime Minister. With pertinent observations, both in regard to important national policies and to their co-ordination and adjustment.

(2) To investigate the important policies proposed to the Cabinet by its Ministers and to make recommendations based on due observation of them. Policies proposed by different Departments are referred to the Board, which is to study them in the light of their importance, and investigate them from the point of view of the unity and harmony of all national policies.

(3) To investigate important policies, and to study the means of co-ordinating and adjusting them.

(4) To make recommendations concerning control over budget estimates on proposed policies.

(5) To have authority to call for explanations or explanatory data such as deemed necessary for carrying out its functions outlined above.

The North China Incident

On Wednesday night, July 7, 1937, a small unit of Japanese troops was engaged in manoeuvres on their usual grounds, near Marco Polo Bridge, southwest of Peiping, and in the vicinity of Lukouchiao and Lungwangmiao on the Yungting River. With the regular summer inspection but a fortnight ahead, all Japanese troops in the area had been drilling day and night for weeks. The Chinese authorities had been notified of these manoeuvres, as usual, and nothing untoward had occurred or been anticipated.

But suddenly, at 11:40 o'clock on this particular night, the Japanese troops were fired upon by Chinese soldiers from the directions of Lukouchiao and Lungwangmiao. This small incident brought in its train the present China Affair. (See Chapter VI.)

Political Affairs in 1937 and 1938

The political affairs of the country in the second half of 1937 and the first half of 1938 were almost exclusively concerned with the international developments arising from the China Affair which began on July 7, 1937. The Government, the political parties and the people of Japan were united closely in pressing forward Japan's national policy with regard to the East Asiatic continent by concentrating the national power to the utmost. All the conflicting opinions and movements were promptly set aside before the great task, and the nation was ready for utmost sacrifice both on the war and the home front.

Political Parties The year was one of inertia for all political parties. They had no time to indulge in expositions of their ideas and ideals for the situation called for united action and they were not slow to co-operate with the Government in all important matters, while the radical factions readily changed their views in conformity with the general trend of thought among the people who strongly felt the need for united action on the continent.

At the end of 1936 and the beginning

Digitized by Google

of 1937 the political parties were tending toward a revival of the situation which prevailed before the February 26 affair of 1936, especially in regard to foreign relations. But events came thick and fast and the political parties could do little to influence their course. There was at first General Ugaki's failure to form a cabinet, followed by the doings of the Hayashi Cabinet which was a going-back to old bureaucracy, and finally the formation of the Konoé Cabinet, which was acclaimed by the whole country. Even the result of the 20th general election in April, 1937, which ended in the victory of the existing political parties against the Hayashi Cabinet failed to give them a full chance for regaining their power. The new parties the birth of which had been much heralded by some groups proved equally unsuccessful. The rightists showed some activities outside the Diet, but could not gain any power, nor could the leftist parties, although one of them was successful in obtaining more seats in the Diet. With the outbreak of the incident most of the political movements of the proletariat parties were completely suppressed by the Government.

The talk of reorganizing the Seiyukai and the Minseito went on throughout the year, but the preoccupation with the problems relating to the incident has made the realization of this object difficult till now. In the 73rd session of the Diet political parties expressed strong criticisms on such important bills as the National Mobilization Bill, the Electric Power Bill and the Budget for 1938-39, but these bills were finally passed without material amendment.

Movement of Bureaucrats The failure of the Hirota Cabinet and the Hayashi Cabinet in renovating the administrative system meant the inability of the bureaucratic elements to rise to the national requirements. With the birth of the Konoé Cabinet which was formed in the spirit of a coalition of all the representative political elements in the country, the bureaucrats withdrew from the front ranks and assumed a proper attitude of obedience to and cooperation with the Cabinet.

The submissive attitude of the political parties and the withdrawal of the bureaucrats were the direct outcome of the situation which demanded complete national solidarity in attaining the national goal of defeating the Kuomintang Government and establishing a permanent peace in East Asia and creating a new Japan. National union and national mobilization should be more difficult to achieve today than in the days of the Russo-Japanese War because the country is much greater now than it was 30 years ago, her international relations are much wider and more complicated, her people more educated and her economic system much more complex. But the traditional spirit of patriotism is ever the strongest factor in the Japanese national life and it is as a result of its call that the people have submerged all minor interests and differences of opinions in the greater need of the times.

Governmental Achievement As to the changes of the Hirota and Hayashi cabinets and the formation of the Konoé Cabinet mention has been made in foregoing pages, together with a description of the beginning of the China Affair up to August, 1937.

The attention of the Government since August, 1937, has been centred on planning and putting into effect all the necessary measures for carrying out Japan's purpose in relation to the China Affair, and all such measures have been passed by the Diet with little or no amendment.

In October, 1937, the Government organized the Cabinet Advisory Council by Imperial sanction, to reinforce its power by gathering veteran statesmen and experienced businessmen around the Cabinet. The first 10 members of the new Cabinet Advisory Council who were appointed on October 15, 1937, were as follows :

General Kazushigé Ugaki
General Baron Sadao Araki
Admiral Baron Kiyokazu Abo
Admiral Nobumasa Suetsugu
Chuji Machida of the Minseito
Yonezo Maeda of the Seiyukai
Kiyoshi Akita, M. H. R.
Baron Seinosuké Go
Seihin Ikeda
Yosuké Matsuoka

Most of the pending problems of improvement in domestic, administrative and social affairs were postponed. In view of the importance of promoting the health and welfare of the people, the Government decided to establish the "Ko-Sei Sho" or a new Department of Health and Social Affairs : and for the purpose of power mobilization the Government presented the Electric Power Control Bill to the 73rd session of the Diet, and succeeded in getting its approval thereto, with some important amendments.

In December, 1937, Dr. Eiichi Baba, Minister for Home Affairs, resigned ow-

Digitized by Google

ing to illness and died shortly after in the same month. The portfolio was assumed by Admiral Nobumasa Suetsugu.

In January, May and June, 1938, a thorough reorganization of the Konoé Cabinet took place with the resignation of Koki Hirota, Minister for Foreign Affairs, Okinori Kaya, Minister of Finance, Shinji Yoshino, Minister of Commerce and Industry, Sonyu Otani, Minister for Overseas Affairs, and General Gen Sugiyama, Minister of War, who were replaced by General Kazushigé Ugaki, as Foreign Minister and concurrently Overseas Minister, Seihin Ikeda, as Finance Minister and concurrently Commerce and Industry Minister, Lieutenant-General Seishiro Itagaki, as War Minister, while Marquis Koichi Kido who had assumed the Portfolios of Education and Health and Social Affairs concurrently was released from the responsibility of Education and General Baron Sadao Araki was given the Portfolio of Education.

The important policies of the Government were best explained in the ministerial speaches given at the 72nd and 73rd sessions of the Diet.

The 72nd Session of the Imperial Diet

The 72nd Diet was specially convened at the beginning of September, 1937. It was opened on September 4 in the presence of His Majesty the Emperor and closed on the 9th of the same month after passing the supplementary budget for military operations and other legislative bills. At the opening ceremony of the session on September 4, His Majesty the Emperor granted the following Imperial Message to the Diet:

"We hereby open the Imperial Diet and address Ourself to the members of the House of Peers and of the House of Representatives.

"It has been Our constant desire that Our Empire and the Republic of China should work in unison in order to ensure the stability of East Asia, and thus attain the common prosperity of Our respective nations. The Republic of China, however, failing utterly to understand the true intentions of Our Empire, indulged in wilful acts of provocation, giving rise at last to the present state of affairs. This is indeed a source of regret to Us.

"Now in the face of manifold difficulties, Our armed forces are discharging their duty with loyalty and valour, to no other end than that of urging the Republic of China to reflect on its attitude, so that peace may be speedily restored in East Asia.

"It is Our wish, in view of the present extraordinary situation, that Our subjects, united in their faithful service to the State and in their devotion to the Throne, will seek to achieve the purpose of the Empire.

"We have instructed the Ministers of State to introduce to the Imperial Diet the urgent additional budgetary and legislative bills. We command you to strive, in conformity with Our wish, to perform to the fullest measure your appointed task of harmonious deliberation and collaboration."

On September 5, the Prime Minister and other ministers gave addresses to the Diet, explaining the policies and measures of the Government mostly in connection with the present China Affair.

Prime Minister Prince Konoé's Address In his opening address before the Diet, Prince Konoé, after referring to the Imperial message, went on to explain the Government's policy, as follows:

Since the outbreak of the affair in North China on July 7, the fundamental policy of the Japanese Government toward China has been simply and purely to seek the reconsideration of the Chinese Government and the abandonment of its erroneous anti-Japanese policies, with the view of making a basic readjustment in relations between Japan and China. This policy has never undergone a change; even today it remains the same. The Japanese Government has endeavoured to save the situation by preventing aggravation of the incident and by limiting its scope. This has been repeatedly enunciated.

The Chinese Government not only failed to understand the true motives of the Japanese Government, but have increasingly aroused a spirit of contempt and have offered resistance toward Japan, taking advantage of the patience of our Government. Thus, by the outburst of uncontrolled national sentiment, the situation has fast been aggravated, spreading in scope to Central and South China. And now, our Government, which has been patient to the utmost, has acknowledged the impossibility of settling the incident passively and locally, and has been forced to deal a firm and decisive blow against the Chinese Government in an active and comprehensive manner.

Digitized by Google

In point of fact, for one country to adopt as its national policy the antagonizing of and the showing of contempt for some particular country, and to make these the underlying principle of national education by implanting such ideas in the minds of the young, is unprecedented in the history of the world. When we consider the outcome of such policies on the part of China, we feel grave concern not only for the future of Sino-Japanese relations, but for the peace of the Orient and consequently for the peace of the entire world. The Japanese Government has repeatedly requested the Chinese Government to reconsider and to change its attitude, but all in vain. This failure of the Chinese Government has finally caused the present affair. We firmly believe that it is in accordance with the right of self-defence as well as with the cause of righteousness and humanity that our country has determined to give a decisive blow to such a Government, so that it may reflect upon the errors of its ways. For the peoples of East Asia, there can be no happiness without a just peace in this part of the world. The Chinese people themselves by no means form the objective of our actions, which objective is directed against the Chinese Government and its army who are carrying out such erroneous, anti-foreign policies. If, therefore, the Chinese Government truly and fully re-examines its attitude and in real sincerity makes endeavours for the establishment of peace and for the development of culture in the Orient in collaboration with our country, our Empire intends to press no further.

At the present moment the sole measure for the Japanese Empire to adopt is to administer a thoroughgoing blow to the Chinese Army so that it may lose completely its will to fight. And if, at the same time, China fails to realize its mistakes and persists in its stubborn resistance, our Empire is fully prepared for protracted hostilities. Until we accomplish our great mission of establishing peace in the Orient, we must face many serious difficulties, and, in order to overcome them, we must proceed steadily with our task, adhering to the spirit of perseverance and fortitude in one united body.

Now that our Imperial Army and Navy, with their loyal officers and men, are advancing with all dignity in the cause of righteousness, exalting its might far and wide, we are filled with grateful emotion. Simultaneously, we feel highly encouraged to witness the sincere support displayed throughout the length and breadth of the Empire.

The Government is hereby introducing to the Imperial Diet urgent budgetary and legislative measures. In these measures the Government seeks to adopt a financial and economic structure for coping with the present extraordinary situation.

The 73rd Session of the Imperial Diet

The 73rd session of the Imperial Diet was convened on December 24, 1937 and closed on March 27, 1938. The strength or representation of different organizations and parties in the Diet on the day of its opening was as follows :

House of Peers :

Body Represented	Membership
Imperial Princes	17
Kenkyukai	162
Koseikai	66
Doseikai	23
Dowakai	33
Kayokai	43
Koyukai	34
Others	31
Total	409

Note : Vacancies 5.

House of Representatives :

Party	Membership
Minseito	178
Seiyukai	173
The First Room Club	49
Social Mass	36
The Second Room Group	13
Tohokai	11
Others	3
Total	463

Note : Vacancies 3.

During the session discussions were centred round the National Mobilization Bill, the Electric Power Control Bill, and the bills for the increase of taxes. After lively debates and keen deliberations all of these epochmaking bills and 86 other bills, submitted by the Government, were passed by both Houses, amendments being made on the Electric Power Control Bill and 11 others only. Among the 86 bills mentioned above, there were such important ones as those for establishing Governmental companies in North and Central China, for tending the limit for issuance of fiduciary notes, for increasing the production of important minerals, for the readjustment of farm lands, for the revision of the Conscription Law, the Health Insurance Law,

Digitized by Google

the Shop Law, the Pension Law and the Labour Exchange Law, for the establishment of the central funds for pensioned and salaried men.

Premier Prince Konoé's Address The gist of the address delivered on January 22, 1938, by Prince Konoé, Premier, was as follows:

Japan's immutable national policy aims at building the edifice of permanent peace for East Asia on the unshakable foundation of close co-operation between Japan, Manchoukuo and China, and to contribute thereby to the cause of world peace. The adoption some time ago of our determined policy not to deal with the obdurate Kuomintang Government of China, and the exertion of ceaseless efforts towards the cultivation of friendly relations with the Powers, have been both dictated by this policy of the Government. We all rejoice for the sake of world peace that the tripartite Anti-Comintern Agreement between Japan, Germany, and Italy was completed through the participation of Italy last fall.

It is now more than half a year since the commencement of the present conflict. The fields of hostilities have been extended from North China to Central and South China. The valorous and daring operations of the Imperial forces have brought us victory after victory. Nanking, the Chinese Capital, quickly fell into our hands. The situation is developing most favourably for Japan. While this is, of course, due to the August Virtue of our Sovereign, I am profoundly grateful for the loyalty and courage of the officers and men of the Imperial forces at the front and for the ardour and enthusiasm of all our people at home.

Now the Government look forward to the emergence of a new Chinese régime which may really be counted upon to co-operate with Japan, and with such a régime they intend to adjust the Sino-Japanese relations and lend their hands in the rehabilitation of China, and in laying firmly thereby the foundation for a permanent peace of East Asia. There will be no change in Japan's policy to respect the sovereignty and territorial integrity of China and the legitimate rights and interests of third Powers in China.

The mission of Japan as the stabilizing force of East Asia is greater and her obligations have grown heavier than ever. In order to fulfil this mission, and to discharge these obligations of ours, we must certainly be prepared to make hereafter still greater sacrifices than we have made heretofore. But unless we resolve to do this, we only lay in store misfortunes for the future. I believe that to bear such sacrifices is a noble duty that we of the present generation owe to posterity.

It is under a conviction such as this that our Government are striving with all their might to deal with the China Affair and to achieve the end they have in view. And for that they are working for the completion of the plans for the national mobilization both material and spiritual, and the execution of the various necessary measures. The Government realize the first necessity of replenishing armaments and filling the national treasury, and accordingly, emphasis has been placed on this point in regulating our country's economy and finances. As regards the budget for the coming fiscal year, it has been so compiled as to devote as much money and material as possible to the fulfilment of military requirements, and to curtail as far as possible the general consumption of the goods and funds having to do with military supplies.

In the field of industry, the basic principle of the Government will be laid in the increase of our nation's productive power under the one comprehensive scheme covering Japan, Manchoukuo and China, and efforts are to be exerted toward supplying the articles needed for national defence, promoting all the important industries, and expanding our export trade.

As for our work at the home front, not only will everything be done to keep our officers and men at the front free from all anxieties for those at home, but suitable and effective measures will be taken to provide for the relief of the families of those killed, wounded, or taken ill.

Far distant still is the end of the conflict. We should expect that it will be a long time before a settlement is reached. Ours is indeed a momentous task unparalleled in history. We shall never succeed in accomplishing the task unless all of us show the dauntless spirit of gladly and courageously offering ourselves to our country. Let me assure you that the Government, with patience and perseverance and a resolute will, expect to reach a settlement of the affair.

Political Affairs in 1938 and 1939

League of Nations and Japan The Council of the League of Nations adopted China's appeal for the invocation of Article XVII of the League Covenant and sent an invitation to Japan on September 19, 1938, but the latter declined to accept the invitation on September 22.

Ugaki Resigns General Kazushige Ugaki, Foreign Minister and Overseas Minister, tendered resignation to the Throne, on September 29, 1938. The reason was unintelligible, but it was generally surmised that there was a certain discrepancy of opinion in the Cabinet in regard to foreign policy at issue. The portfolio was concurrently assumed by Premier Konoé.

Capture of Canton and Hankow Japanese forces succeeded in landing at Bias Bay, in South China, in face of the enemy, on October 12, 1938, and entered the city of Canton, on October 21, 1938. The Japanese attack of South China effectively surprised the Kuomintang Government and Chinese armies in Hankow, and Japanese troops captured a part of Hankow on October 25, 1938, without receiving material resistance, and the three cities of Wuchang, Hankow and Hanyang were completely occupied by Japanese army and navy on October 27, 1938.

New Ministers Installed Mr. Hachiro Arita who had been the Foreign Minister in the Hirota Cabinet in 1936, was appointed again Foreign Minister, and Mr. Yoshiaki Hatta was installed as Overseas Minister on October 29, 1938.

Wartime Financial and Economic Measures During the months after September, the Government was fully occupied with the wartime situation at home and diplomatic affairs in relation to international questions which constantly arose with the development of the China Affair. Important steps taken by the Government in continuation from preceding years or as new measures were as follows:

For the purpose of meeting war expenses which amounted to 7,400 million yen, bond issues amounting to 6,700 million yen, encouragement of savings among the people, tax increase for obtaining 400 million yen, and transfers from special accounts to the sum of 100 million yen; For an increased production of munitions material, expansion of factories and equipments in mining and heavy industries; For the maintenance and improvement of international balance of payments, trade control and foreign exchange control; For increasing imports and the maintenance of foreign exchange and the international value of currency, promotion of export business, creation of foreign exchange fund system, installation of export and import link system, utilization of bonded factories, a new system to advance export funds, increase of receipts in invisible trade, encouragement of gold production and concentration of gold with the Government, and regulations against profiteering; For restraining rises in commodity prices and stabilization of the living conditions of the people, price restraining measures, creation of the Price Commission and Price Adjustment Commission, institution of the standard maximum price system, official price system, net price system and economic police system; For the relief of the unemployed and persons who have been forced to suspend business or change occupation on account of restriction on importation and use of goods, state management of labour exchanges and other measures; For safeguarding adequate supply of military material, restriction on and prohibition of use of goods, control of distribution of important goods, encouragement of invention and use of substitutes, subsidy for manufacture of substitutes, and encouragement of reform of the people's way of living.

The Konoé Cabinet has been, in general, successful in carrying out these measures with good understanding and loyal support of the people, except such complicated and apparently difficult question as price control and the relief of persons who lost business and were compelled to change occupation, both of which have been left to the good office of the present Hiranuma Cabinet.

China Affair

In regard to the advance to and occupation of important points and cities in China by the Japanese army and navy, minutes are given in Chapter VI, Foreign Relations and the Chapter on China. The Japanese conviction in the present incident and the attitude toward the Kuomintang Government have been announced unchanged by competent authorities on various occasions.

Statement of the Government On November 3, 1938, the Government made a statement concerning the future of East Asia. The gist of the statement follows:

Digitized by Google

What Japan seeks is the establishment of a new order which will insure the permanent stability of East Asia. In this lies the ultimate purpose of our present military campaign.

This new order has for its foundation a tripartite relationship of mutual aid and co-ordination between Japan, Manchoukuo and China in political, economic, cultural and other fields. Its object is to secure international justice, to perfect the joint defence against Communism, and to create a new culture and realize a close economic cohesion throughout East Asia.

What Japan desires of China is that that country will share in the task of bringing about this new order in East Asia. She confidently expects that the people of China will fully comprehend her true intentions and that they will respond to the call of Japan for their cooperation. Even the participation of the Kuomintang Government would not be rejected, if, repudiating the policy which has guided it in the past and remoulding its personnel, so as to translate its re-birth into fact, it were to come forward to join in the establishment of the new order.

Japan is confident that other Powers will on their part correctly appreciate her aims and policy and adapt their attitude to the new conditions prevailing in East Asia. For the cordiality hitherto manifested by the nations which are in sympathy with us, Japan wishes to express her profound gratitude.

Premier Konoé's Address On the same day, Prince Konoé, Prime Minister, made a radio address on the same subject, excerpts from which follow:

Following upon the captuure of Canton, Hankow, the heart of China, was also taken, so that the so-called "Middle Plain" with its seven great cities, which virtually sustain the life of modern China, has now fallen into our hands. There is an old Chinese saying to the effect that "He who controls the Middle Plain controls the whole land." Thus the Chiang Kai-shek government is no longer anything but a local régime. Japan has achieved these results without overstraining her fighting power, which has always been kept at a level sufficient to ward off any intervention from the outside. We are moved, as never before, by the consciousness that this has been made possible by the august virtue of His Majesty, the Emperor, and the heroic efforts of His valiant officers and men. . . The key to China's fate is now in our hands. What, then, do we want? We want not the destruction of China but her prosperity and progress; not the conquest of China but cooperation with her. Working hand in hand with the Chinese awakened to a new consciousness of being people of the Orient, we want to build up an East Asia which is peaceful and settled. Allow me to state that no country is better aware than Japan of the ardent national aspirations of the Chinese, nor feels more keenly the need that China shall vindicate her position as a completely independent state.

It is an historical necessity that the three great neighbour nations, China, Manchoukuo and Japan, while fully retaining their respective individuality should stand closely united in their common duty of safeguarding East Asia. It is deeply to be deplored not only for the sake of Japan but for that of all Asia that the attainment of this goal has been thwarted through the mistaken policy of the Kuomintang Government. The policy of that government was based on the transient tide of the period that followed the Great War. It did not originate in the inherent intelligence and good sense of the Chinese people. In particular, the conduct of that government, which in its efforts to stay in power cared not whether the nation was left a prey to Communism or relegated to a minor colonial status, cannot but be regarded as treason toward those many patriotic Chinese who had risked their lives in order to erect a new China. It was in those circumstances that Japan, reluctant as she was to be involved in the tragedy of two great kindred nations fighting against each other, was compelled to take up arms against the Chiang Kai-shek régime.

Japan fervently desires the awakening of China. It is my hope that wise and foreseeing Chinese will be swift to assume leadership and to guide their nation back to the right path, and lead the rejuvenated state forward in the fulfilment of our common task in East Asia. Already in Peking and Nanking signs of rebirth have appeared. And in the wide plains to the north and west, a new Mongolia is springing to life. Let the Chinese people, who in the past 5,000 years of their history have illumined again and again the annals of civilization, prove once more their greatness by sharing in the stupendous task of creating a new Asia. Participation even by the Nationalist Government need not be rejected if, returning to the true spirit of China, it should repudiate its past policy, re-

Digitized by Google

mould its personnel and offer to join in the work as a thoroughly regenerated régime.

The nations of the world must surely be able to comprehend these new developments in East Asia. It is undisputed history that China heretofore has been a victim of the rivalry between Powers whose imperialistic ambitions have constantly imperilled her tranquillity and independence. Japan realizes the need of fundamentally rectifying such a state of affairs and she is eager to see a new order established in East Asia—a new structure of peace based on true justice.

Japan is in no way opposed to collaboration with foreign Powers, nor does she desire to impair their legitimate rights and interests. If the Powers, understanding her true motives, will formulate policies adapted to the new conditions, Japan will be glad to cooperate with them. Japan's zeal for stamping out Communism is well known. The aim of the Comintern is to sovietize the Orient and to overturn the world. Japan is firmly determined to eradicate the communistic influence which is behind the so-called "long-term resistance" of the Chiang régime. Germany and Italy, our allies against Communism, have manifested their sympathies with Japan's aims in East Asia and we are profoundly grateful for the great encouragement that their moral support has given our nation during this crisis. In the present emergency, it is necessary for Japan not only to strengthen still further her ties with those countries but also to collaborate with them on the basis of a common world outlook in the reconstruction of world order.

December Statement The Japanese Government, which had hitherto published statements mostly on the general aim and principle of Japan in carrying on the China Affair, made a substantial statement in regard to her demands upon China, in the name of Premier Konoé, on December 22, 1938, as follows:

The Japanese Government is resolved, as has been clearly set forth in its two previous statements issued this year, to carry on the military operations for the complete extermination of the anti-Japanese Kuomintang Government, and at the same time to proceed with the work of establishing a new order in East Asia together with those far-sighted Chinese who share in our ideas and aspirations.

The spirit of renaissance is now sweeping over all parts of China and enthusiasm for reconstruction is mounting ever higher. The Japanese Government desires to make public its basic policy for adjusting relations between Japan and China, in order that its intentions may be thoroughly understood both at home and abroad.

Japan, China and Manchoukuo will be united by the common aim of establishing the new order in East Asia and of realizing a relationship of neighbourly amity, common defence against Communism, and economic cooperation. For that purpose it is necessary first of all that China should cast aside all narrow and prejudiced views belonging to the past and do away with the folly of anti-Japanism, and resentment regarding Manchoukuo. In other words, Japan frankly desires China to enter of her own will into complete diplomatic relations with Manchoukuo.

The existence of the Comintern influence in East Asia can not be tolerated. Japan therefore considers it an essential condition of the adjustment of the Sino-Japanese relations that there should be concluded an anti-Comintern agreement between the two countries in consonance with the spirit of the anti-Comintern Agreement between Japan, Germany and Italy. And in order to ensure the full accomplishment of her purpose, Japan demands, in view of the actual circumstances prevailing in China, that Japanese troops be stationed, as an anti-Communist measure, at specified points during the time the said agreement is in force, and also that the Inner Mongolian region be designated as a special anti-Communist area.

As regards economic relations between the two countries, Japan does not intend to exercise economic monopoly in China, nor does she intend to demand of China to limit the interests of those third Powers, who grasp the meaning of the new East Asia and are willing to act accordingly. Japan only seeks to render effective the cooperation and collaboration between the two countries. That is to say, Japan demands that China, in accordance with the principle of equality between the two countries, should recognize the freedom of residence and trade on the part of Japanese subjects in the interior of China, with a view to promoting the economic interests of both peoples; and that, in the light of the historical and economic relations between the two nations, China should extend to Japan facilities for the development of China's

Digitized by Google

natural resources, especially in the regions of North China and Inner Mongolia.

The above gives the general lines of what Japan demands of China. If the true object of Japan in conducting the present vast military campaign be fully understood, it will be plain that what she seeks is neither territory nor indemnity for the cost of military operations. Japan demands only the minimum guarantee needed for the execution by China of her function as a participant in the establishment of the new order.

Japan not only respects the sovereignty of China, but she is prepared to give positive consideration to the questions of the abolition of extra-territoriality and of the rendition of concessions and settlements—matters which are necessary for the full independence of China.

Diplomatic Issues The rapid development of the China Affair gave rise to many diplomatic problems between Japan and the Powers which have rights and interests in China such as Great Britain, France and the United States of America, during the period under survey. The explanations on the problems and negotiations with these countries are given in Chapter VI, Foreign Relations. As a whole, the Powers are very moderate in their attitude toward Japan, apparently with due understanding as regards the inevitability of troubles arising under such circumstances, and negotiations are going on without any grave frictions.

Matters concerning Japan's aid for the rehabilitation and reconstruction of China are stated in the Chapter on China at the end of this volume.

Anti-Comintern Agreement

The German-Japanese Agreement against the Communist International which had been concluded on November 25, 1936, was reinforced by the participation of Italy on November 6, 1937, as it was stated in the 1938-9 Japan Year Book, pp. 200, 201. Now this Tripartite Anti-Comintern Pact developed to a hexadic agreement, with the participation of Hungary and Manchoukuo on February 24, 1939, and Spain on March 27, 1939.

On January 16, 1939, the Foreign Office spokesman made a statement on the participation of Manchoukuo and Hungary, in which he said, "It is a significant development in the international situation that at the beginning of the year Manchoukuo and Hungary, complying to the joint invitation made by Japan, Germany and Italy, the three original signatories, have expressed their intention of participating in the Anti-Comintern Agreement. The Comintern is the common enemy of mankind, scheming as it does for the obliteration of the history and culture and the destruction of the order of every nation. It is quite natural, therefore, that the existence of this subversive organization cannot be tolerated in any region of the world, and that all Powers, acting in cooperation, are determined to bring about its extinction. The Comintern previously attempted to bolshevize Spain and Central Europe, but it was expelled by Germany and Italy. In Great Britain and France also it camouflaged itself under the guise of democracy and agitating the left wing elements, schemed to bring about the bolshevization of those countries. As a result, it incurred the strong animosity of these Powers; and Anti-Comintern sentiment throughout Europe is gaining strength. Hungary has now come forward to join the Anti-Comintern pact.

In East Asia Japan was the first to undertake the task of safeguarding against the Communist menace. Now, with Manchoukuo about to join in the agreement, the anti-Comintern front extending over Europe and Asia has been given new strength. Japan, which has assumed the great task of establishing a new order in East Asia, warmly welcomes the addition of two strong links in the East and West in the pact to exterminate the Comintern menace. We firmly believe that the participation of Hungary and Manchoukuo will lead to the adherence by other Powers, who share our views, in the anti-Comintern agreement."

The participation of Spain in the Agreement was announced on April 8, 1939, and the statement of the Foreign Office spokesman was as follows:

"Spain, reborn under the leadership of General Francisco Franco, has formally participated in the Anti-Comintern Agreement of which Japan, Germany and Italy are original signatories. At a time when the political situation in Europe is in confusion, it is indeed significant that Spain has joined the front against Comintern. The Comintern, which failed utterly in its efforts to bolshevize Germany and Italy in previous years, laid the front line in Spain for the bolshevization of all of Europe. As a result, Spain was divided into two opposing factions, with bitter tragedies enacted as Spaniard fought Spaniard and brother fought brother. Although

Digitized by Google

realizing the sacrifices they would have to make and the tragedies they would have to suffer, the faction led by General Franco, surmounting numerous difficulties, finally occupied Barcelona early this year and succeeded in pacifying the Catalonian sector. The Communist régime immediately collapsed, and Madrid finally capitulated on March 28th. The Spanish civil war which began two and a half years ago was thus brought to a close, culminating in a decisive victory for General Franco. The Powers in the Anti-Comintern front have early extended recognition to General Franco's Government and have been giving full support to that Government's work of subduing Communism.

The Japanese Government pays its profound respect to the brilliant achievement of the Spanish Government and at the same time earnestly hopes that the relations between Japan and Spain will, through increasing cooperation between them, grow in cordiality."

(The protocols exchanged with these countries are given at the end of this volume, as Appendix.)

Fishery Disputes with the U. S. S. R. The revision of the Russo-Japanese Fishery Agreement fell due in 1936, but the Soviet Government refused to sign it, and the Japanese Government was twice obliged to conclude a modus vivendi in 1936 and 1937. Negotiations were renewed in 1938 between Japanese Ambassador Togo and Foreign Commissar Litvinoff at Moscow. During the latter half of 1938 and the beginning of 1939, there were many occasions on which disruption was considered inevitable. The patience of Ambassador Togo, however, finally conquered over the stubbornness of the Foreign Commissar, and negotiations came to a satisfactory conclusion on April 2, 1939 and a modus vivendi was signed at Moscow at midnight. (See Chapter VI, Foreign Relations, for a fuller account.)

Change of the Cabinet

On January 4, 1939, Prince Fumimaro Konoé, Prime Minister, tendered resignation to the Throne. H. I. M. the Emperor immediately called Mr. Kurahei Yuasa, Grand Keeper of the Imperial Seals, and sent him to the Genro, Prince Kimmochi Saionji, at Okitsu, Shizuoka prefecture to get his advice on the nomination of the next premier. The Imperial messenger brought back the Genro's recommendation in the evening, and the Emperor granted audience to Baron Kiichiro Hiranuma, President of the Privy Council, at 10 p.m., and gave him order to form the new Cabinet.

Baron Hiranuma succeeded in his task with an unprecedented speed and the inauguration of the new cabinet took place in the Imperial palace in the afternoon of January 5, 1939.

At the time of the inauguration of the Hiranuma Cabinet, it consisted of the following 13 ministers:

Prime Minister	Baron Kiichiro Hiranuma, former President of the Privy Council.
Minister without Portfolio	Prince Fumimaro Konoé, former Prime Minister.
Minister for Foreign Affairs	Hachiro Arita, remaining in office.
Minister for Home Affairs	Marquis Koichi Kido, M. H. P., former Minister of Welfare.
Minister of Finance	Sotaro Ishiwata, former Vice-Minister of Finance.
Minister of War	Lieutenant-General Seishiro Itagaki, remaining in office.
Minister of Marine	Admiral Mitsumasa Yonai, remaining in office.
Minister of Justice	Suehiko Shiono remaining in office.
Minister of Communications	"
Minister of Education	General Sadao Araki, remaining in office.
Minister of Agriculture and Forestry	Yukio Sakurauchi, M. H. R., of the Minseito.
Minister of Commerce and Industry	Yoshiaki Hatta, M. H. P.
Minister of Overseas Affairs	" remaining in office.
Minister of Railways	Yonezo Maeda, M. H. R. of the Seiyukai.
Minister of Welfare	Hisatada Hirosé, former Vice-Minister of Welfare.

Digitized by Google

At the same time Prince Konoé was appointed President of the Privy Council. On January 4, Prince Konoé announced reasons for his action as follows:

"It was not very long after I was commanded to become Premier in June, 1937, that the China incident occurred. With the China incident growing increasingly serious, the situation at home and abroad became gradually more complex. I often feared that my capacity was not sufficient to cope adequately with the situation arising from the incident, but the seriousness of the times did not allow a change of Cabinet until the present occasion. However, the China incident now has entered a new stage, and the time has come when the Government must concentrate its efforts on the construction of a new order so as to maintain lasting peace in East Asia. I am convinced that it is urgently necessary to enhance the confidence of the nation by formulating new policies under a new Cabinet. The unshakable fundamental policy of the Government toward the incident already has been established and approved by the Emperor. Having thus been freed from this important responsibility, I am filled with trepidation concerning my lack of ability to carry on my duties. This is the reason why I have tendered the resignation of my Cabinet."

According to the press comments on the occasion, the Konoé Cabinet was confronted with difficulties in carrying out wartime political, economic and social renovation measures. Another reason was in the failure of the efforts for the formation of a new political party sponsored by some members of the Cabinet and outsiders, and Prince Konoé, who was always unwilling to be brought forward as the president of the proposed party, was glad to be freed from this lure as well as premier's responsibility and leave the pending questions with a certain senior statesman.

The 74th Session of the Diet

The 74th Session of the Imperial Diet was convened on December 24, 1938, and closed on March 26, 1939. The strength or representation of different organizations and parties in the Houses on the day of its opening was as follows:

House of Peers:

Body Represented	Membership
Imperial Princes	16
Kenkyukai	161
Koseikai	69
Kayokai	44
Koyu Club	35
Dowakai	31
Doseikai	21
Others	36
Total	413

House of Representatives:

Party	Membership
Minseito	178
Seiyukai	170
The First Room Club	46
Social Mass Party	35
The Second Room Club	13
Tohokai	12
Others	6
Total	460

Note: Vacancies 6.

The Houses gave consent to the Governmental budgets which amounted to over ¥9,400,000,000, and passed all the 89 bills presented by the Cabinet, only 10 of which were amended in some minor points. Important bills passed and the budgets approved are mentioned below:

I. Budgets;

Supplementary budgets for the fiscal year 1938-39

1. ¥16,500,000
2. Revenue ¥7,839,000
   Expenditure ¥19,805,000

Budget for the fiscal year 1939-40 ¥3,694,666,000

Supplementary for the same

1. Military expenditure ¥910,543,000
2. Civil expenditure ¥199,332,000

II. Extraordinary Military Expenditure;

Army	¥3,143,000,000
Navy	¥812,000,000
Reserve fund	¥650,000,000
(Special reserve for concluding contracts outside of the general budget)	(¥700,000,000)

New Laws to be Promulgated:

1. Financial Laws; Revised China Affair Special Tax Law, Revised Special Profits Tax Law, Revised Temporary Land Tax Disposition Law, Law for the Exemption from or Postponement of Levying Taxes for the Relief of Calamity Stricken People, Revised Tariff Law, and four other laws on taxes. Nine laws for the floatation of public bonds. Three laws for special accounts. Four laws for readjustment of funds.

Digitized by Google

2. Laws pertaining to exploitation of resources; The Imperial Mining Company Law, Law for mining coal in Karafuto, The Japan Gold Mining Company Law, Revised Gold Mining Law, Law for the Manufacture of Light Metals, Revised Industry Law, Revised Mine Law, Rice Distribution Control Law, Taiwan Rice Importation Control Law, Horses Protection Law, and six other laws.

3. Laws on transportation; The Great Japan Aviation Company Law, The Sea Transportation Association Law, Shipbuilding Industry Law, and four other laws.

4. Military Laws; Military Resources Secrecy Protection Law, Revised Conscription Law, and five other laws.

5. Social or Cultural Laws; Officials' Health Insurance Law, Mariners Protection Law, Revised Health Insurance Law, Revised P. O. Annuity Law, Cinema Law, Copy Right Agent Law, and two other laws.

6. Educational or Religious Laws; Religious Organization Law, and five other laws.

7. Judicial Laws; Arbitration Law, Criminals Protection Law, Revised Court Formation Law, and four other laws.

8. Laws in relation to colonies; For Chosen five laws, for Taiwan one law, and for others four laws.

9. Others; Revised Insurance Law, Law on the way of taking Census, and one other law.

Ministerial Addresses Ministerial addresses at the 74th Session were delivered on January 21, 1939, the main points of which are quoted below:

Baron Kiichiro Hiranuma, Prime Minister, said in part as follows:

As for relief work for soldiers, His Majesty the Emperor was pleased some time ago to grant a gracious message together with a generous sum of money from the Imperial Privy Purse. Indeed, the Imperial benevolence knows no bounds. The Government, in conformity with the Imperial will, has established the Society for Relief of Soldiers as an Imperial Foundation, which, in conjunction with governmental establishments, is expected to make perfect the work of military relief and relieve the officers and men at the front from all cares and anxieties regarding their families at home.

In regard to the China Affair upon which both the Government and the people are concentrating their endeavours, there exists an immutable policy, for which Imperial sanction was obtained by the previous Cabinet, and in accordance with which the necessary steps have been taken in various directions. Being, of course, committed to the same policy, the present Cabinet is determined to proceed at all costs to the achievement of the final purpose.

Obviously no lasting peace can be hoped for unless Japan, Manchoukuo and China, the three countries responsible for the stability of East Asia, are speedily united in the realization of the abovementioned common objective—the establishment of a new order to replace the old. "Overcome," said the Emperor Meiji, "the evil ways of the past, and follow the just principles of nature." Here we have, I believe, what must be the basis of government in our country. Here is the ideal which was handed down from time immemorial by the Imperial Ancestors, and in accordance with which all the Imperial Successors have ruled the land. To "follow the just principles of nature" means in the last analysis to enable all entities to find their own proper places, and therein lie also, I believe, the essentials of government. And this principle applies equally to internal politics and international relations. The construction of the new East Asiatic order should proceed on the basis of this ideal.

I hope the above intention of Japan will be understood correctly by Chinese so that they may cooperate with us without the slightest apprehension. Otherwise, the construction of the new order would be impossible. As for those who fail to understand to the end and persist even hereafter in their opposition against Japan, we have no other alternative than to exterminate them. On the other hand, those who desire to make of themselves pioneers of a new China and cooperate in the execution of our national policy should be encouraged to take part in this historic task. We should gladly help them to rescue the Chinese masses from misery and distress, and liberate them from the bondage of old prejudices. Happily in China today, enthusiasm for reconstruction is beginning to sweep over the whole country, with a growing number of men and women who fall in line with the measures put into practice by the authorities of the new Governments at Peking and Nanking and the autonomous Government of Mongolia. This is a matter for congratulations for the sake of the stabilization of East Asia, and also as the fruit of our country's national purpose.

Since Communism has become so rampant on the Asiatic continent as to

Digitized by Google

threaten to usurp the political power of China, its elimination is absolutely necessary if truth and righteousness are to prevail. In order to realize this, we must promote understanding with third Powers, and cooperation and collaboration especially with those Powers who fully understand us. Germany and Italy, as you are aware, have, from the beginning of the present conflict, consistently given us whole-hearted support, for which we are profoundly grateful. It is exceedingly gratifying that Japan's relations with these friendly Powers with whom we are bound by the Anti-Comintern Agreement are growing more intimate and cordial.

The notable development of Manchoukuo is a hopeful sign for the construction of a new East Asia. The measures calculated to maintain the inseparable relationship between Japan and Manchoukuo should be further strengthened. On the other hand, allow me to state that it is far from the thought of the Japanese Government to oppose needlessly the economic or cultural activities of third Powers. I earnestly hope that they will appreciate the true intentions of Japan and extend cooperation toward the construction of the proposed new order in East Asia.

The statement of the Japanese Government issued by the previous Cabinet which is based upon the basic policy vis-à-vis the China Affair, makes clear the guarantee required of China as a participant in the construction of the new order. The statement provides, I am confident, a principle most suited to the present situation for guiding the Chinese people and also for enlightening third Powers. Thanks to the valiant actions on the part of the Imperial forces and to the loyal support rendered by our people on the home front both in Japan Proper and overseas territories, the desired military victories have been won. The Kuomintang Government, still frantically pursuing its anti-Japanese and pro-Communist policy, has been reduced to the status of a local régime through its flight to a remote province. However, the final aim of our present campaign in China does not lie simply in military victories, but in the rebirth of China, and in the creation thereby of a new order uniting Japan, Manchoukuo and China on a relationship of mutual aid and collaboration. With the recent establishment of the China Affairs Board, it is now expected that all matters relating to China will proceed smoothly. Of course, it is not difficult to see that the way is long and beset with difficulties. In order to surmount them and to make possible a glorious future, we should follow in the footsteps of our forefathers and devote our best efforts to the task on hand, rendering, in the spirit of national solidarity, united service to the Throne. It means the concentration of all the spiritual and material resources of the nation upon the accomplishment of one purpose. . . .

The Goververnment deems it of urgent importance to develop and reinforce all systems of transportation and communication in accordance with the new conditions in East Asia and is taking appropriate measures. As for the various control measures carried out hitherto for economic activities, they must, of course, be continued within the bounds necessary for the maximum application of the total strength of the nation. However, while these measures have until now mostly been economic, to meet the immediate requirements of prosecuting military operations, we must hnceforth put into operation, in addition, other control measures which are of a permanent and constructive character. Accordingly it is essential to strengthen the alignment of the national life in general mobilization,—namely, to invoke in due order the necessary provisions in the National General Mobilization Law, effecting at the same time various internal reforms.

On the other hand, the Government will carefully consider measures to be taken for coping with the problems of the suspension of business, unemployment arising among merchants and manufacturers, who will be affected by the governmental steps already described, as well as general measures for stabilizing the livelihood of the nation on the home front, such as promoting healthy development of the farming and fishing populations. And in order to accomplish this, it is essential to execute through free and active cooperation of the Government and people, unhampered by convention, the measures appropriate to the present situation.

It is with these considerations, that the Government is submitting budgetary and legislative bills in order to carry out its policies. As the present Cabinet was formed only recently, the bills prepared by the previous Cabinet, which have been found after careful study to be suited to the present situation, are being submitted for your consideration.

Foreign Minister Hachiro Arita's Address It is scarcely necessary to reiterate that Japan's foreign policy, based upon the fundamental principles of

Digitized by Google

our national polity, and designed principally for the fulfilment of Japan's moral responsibilities, has always been so conducted as to promote the interests and welfare of East Asia through the cooperation and collaboration of the peoples of that region, and to contribute to the general prosperity of mankind. Following the establishment of the Empire of Manchoukuo, the Japanese Government, having in view the neighbourly and inseparable relationship existing between Japan and that country, made it a policy to cooperate toward her healthy development as an independent State. Legal and administrative systems have been set up in due succession, and the work of developing natural resources is progressing, so that the 30,000,000 people of the land are living happily, secure of their livelihood. The national foundations have been consolidated more firmly than ever, and seven Powers have already extended recognition to the empire. The establishment of peace and order and the expansion of industries have notably benefited all other countries concerned, including Great Britain and the United States, whose trade with Manchoukuo is showing marked increases in volume as compared with the years prior to the Manchurian Incident.

As regards the present China Affair, the basic policy and the resolute aim of the Japanese Government have been set forth in its statement of the 3rd of November last year. What Japan desires is the creation of a new order which is to secure the permanent peace of East Asia, that is to say, the construction of a new East Asia upon a moral foundation, in which Japan, Manchoukuo and China, while each fully reserving her independence and individuality, will stand united and linked together for collaboration and mutual aid along all lines of political, economic and cultural activities. It is the firm conviction of the Japanese Government that such a new order is not only absolutely necessary for the existence and healthy development of Japan, Manchoukuo and China, but also conducive to the real peace and well-being of the whole world. Under date of December 22nd last the Japanese Government issued another statement declaring its intention of joining hands with far-sighted Chinese animated by similar ideals and aspirations, and to work together for the common purpose of constructing the new East Asiatic order and for the realization and mutual practice of neighbourly amity, economic cooperation, and joint defence against Communism. It was also announced that what Japan asks of China is neither territory nor indemnity for the cost of military operations, and further that not only will Japan respect the sovereignty of China, but she is even prepared to give practical consideration to the questions of the abolition of extra-territoriality and the rendition of foreign concessions and settlements, a matter which is obviously required for China's complete independence.

Despite the repeated explanations given by the Japanese Government, there persist unfortunately misunderstandings in certain quarters abroad, ascribing to Japan an intention to close the doors of China. If we are to embark upon the creation of a new order in East Asia through mutual assistance and solidarity between Japan, Manchoukuo and China, it will of course be necessary to enforce certain restrictions and regulations in spheres having a vital bearing upon the national defence and economic independence of the three countries. But these measures will be confined to the minimum requirements, being directed toward no other purpose than that of enabling East Asia to function well as a link in the chain of world economy and to contribute to the general prosperity of mankind. Consequently there will be left open vast fields wherein not only will the rights and interests of other countries and commercial and other peaceful enterprises of their nationals remain absolutely unaffected, but wherein foreign participation will be really welcome, so that it is confidently expected that the economic activities of other Powers will be more than ever stimulated under the new order.

The Japanese Government, believing the removal of trade barriers of various kinds and the promotion of economic cooperation among the nations to be the best means of advancing the happiness and prosperity of mankind, have always striven toward the realization of those ends. Its future policy in this regard will sustain no change. In fact, it is in accordance with this very policy that the Japanese Government plans to limit to the necessary minimum all restrictions on the economic activities of other Powers under the proposed system for Japan, Manchoukuo and China. It is hoped and expected that the Powers concerned will understand the true intentions of Japan and extend active cooperation in the

Digitized by Google

task of constructing the new order in East Asia.

It is regrettable that the China Affair has given rise to circumstances prejudicial to the individual rights and interests of the nationals of other Powers in China, or has placed restrictions on their residence and travel. That these circumstances have been unavoidable owing to military necessities is, I believe, appreciated by all. On the other hand, the Japanese Government, paying careful attention to the matter, has followed the policy of expediting the settlement of pending cases as far as is permitted by circumstances and as soon as the necessary investigations are completed. Already not a few cases have thus been satisfactorily settled.

As regards the reportd conveyance of arms through French Indo-China and other territories, the Japanese Government has from time to time called the attention of the Governments concerned to the matter; and when necessary, proper steps will be taken. The China Affair has now entered upon a new phase as the result of the fall of Canton and Hankow. While we will not relax our efforts for the overthrow of the anti-Japanese régime, we are obliged at the same time to address ourselves earnestly to the work of construction.

Although the Chiang Kai-shek régime is still professing its policy of a so-called "long-term conflict," it has already fled into a remote province and become a purely local régime, while, in the regions in the occupation of our forces sentiment is growing rapidly against the Comintern and in favour of friendship with Japan. The Provisional Government at Peking and the New Government at Nanking respectively and the Autonomous Government of Mongolia are all making healthy progress and steadily winning popular support and confidence. Moreover, in the fall of last year a Joint Committee was formed by the Provisional and the New Governments; and movements are coming to a head in Hankow and Canton for the establishment of other local governments. It is hoped that a new Central Government may be speedily organized which may cooperate with us for a settlement of the present conflict. As for the recent flight from Chungking of certain leaders of the so-called "peace faction" in the Chiang Kai-shek régime, the Government is watching carefully for consequent developments.

In order to cope with the destructive activities of the Communists, there was concluded some time ago the Japanese-German Agreement for Safeguarding against the Communist International, to which Italy subsequently became a signatory. The manœuvres of the Comintern are both insidious and elusive, but in Europe and in Asia wherever there is any disturbance of peace and order, there is invariably to be discovered the hand of the Comintern behind the scenes. The Civil War in Spain, now almost three years old, affords a most outstanding example of the activities of this organization, whose favourite procedue is to utilize a local affair as a fuse to set off a general conflagration in order to bolshevize the world. Indeed the Comintern is the arch-enemy of peace and order.

In East Asia, too, the Communists were active before the commencement of the present China Affair, instigating the Kuomintang Government and causing Chiang Kai-shek to pursue an anti-Japanese policy. Since the outbreak of hostilities, they have rapidly extended their sinister influence and have ultimately made their way into the inner councils of the Kuomintang Government so as to command positions of leadership in both military and political affairs. The so-called "long-term conflict" as well as guerilla tactics have originated in the recommendations of the Communist Party. They constitute a conspiracy which, by sacrificing the masses of China, aims at the postponement for as long as possible of a settlement of the present conflict and by that means at the bolshevization of China and of the entire world.

Fortunately, however, the Japanese-German-Italian Agreement against the Communist International has proved efficacious in checking to some extent in Asia, as well as in Europe, the destructive operations of the Comintern. In the light of experience we cannot but believe that the more this agreement is expanded and strengthened, the more potent will be the guaranty of world peace. The recent announcement by Manchoukuo and Hungary of their intention to participate in the agreement is gratifying as an extension of the anti-Comintern front.

Our relations with the Soviet Union became extremely strained at the time of the Changkufeng Affair, which, however, was settled through appropriate action on our part before it assumed serious proportions. In North Saghalien the illegal interference with our concession rights pertaining to oil and coal have not ceased as yet, rendering the exercise of those rights more and more difficult. As regards the fishery

Digitized by Google

question, although we have continued to exert our utmost efforts for the conclusion of the treaty, the draft of which has long been mutually agreed upon, the negotiations have failed owing to the questions which have been injected into the discussions by the Soviet Government, and which have no relevance to the fishery treaty. In December last the Government entered into negotiations for the renewal of the modus vivendi which was to expire at the end of the year. But, even in this case, the Soviet Government put forward and insisted upon many unreasonable conditions, so that no agreement could be reached before the year-end. It was therefore decided to carry over the negotiations to this year, after requesting the Soviet Government to take no measures that might affect the status quo of the fishery situation. While it is expected that the Soviet Government will negotiate with sincerity and that ultimately a satisfactory agreement will be arrived at, Japan is, of course, prepared to take appropriate steps when it comes to a question of protecting her legitimate vested rights and interests.

Finance Minister Sotaro Ishiwata's Address With regard to the 1939-40 Budget, the preceding Cabinet completed the general compilation, and therefore we have arranged to take it over for introduction into the present Diet. The amount of the General Budget for the 1939-40 fiscal year is a little more than 3,694 million yen both in revenue and expenditure, which when compared with the budget amount for the preceding fiscal year, shows an increase of a little over 180 million yen.

This is made up, in round numbers, of 2,801 million yen from taxes and other ordinary revenue, 84 million yen brought over from the preceding fiscal year as a surplus fund, and 809 million yen as proceeds from public loans. The ordinary revenue just mentioned shows an increase of 294 million yen when compared with the corresponding budget amount for the preceding fiscal year, this estimated increase being largely due to estimated increases in tax proceeds. To be more exact, the income tax proceeds are estimated to increase by some 160 million yen, the provisional profit tax proceeds by 102 million yen, the business profit tax proceeds by 23 million yen, the inheritance tax proceeds by 13 million yen and other items by 23 million yen, totalling more than 323 million yen, while the brewery tax, stock and commodity exchange tax and other tax proceeds are estimated to decrease by a little more than 58 million yen in all. Therefore, the tax revenue as a whole is to increase roughly by 264 million yen, and I am inclined to think that this estimated increase in revenue may roughly be taken to reflect a favourable trend in economic circles.

Apart from the tax revenue, some of the principal increases and decreases in the estimates for ordinary revenue include an increase in round numbers of 15 million yen in forestry proceeds, an increase of 7 million yen in levies on horse races, an increase of 40 million yen in proceeds from the enforcement of the Convertible Bank Note Consolidation Law, a decrease of 13 million yen in the Monopoly Bureau profits, a decrease of 19 million yen in revenue due to the non-payment of Manchoukuo's share of national defence expenses, etc.

The Budget for the 1939-40 fiscal year has been compiled so as not only to concentrate all governmental measures for the purpose of attaining the objective of the Affair, as in the preceding fiscal year, but also to consolidate them even more intensively. Naturally we have so arranged as to strengthen all measures connected with the Affair as far as possible, while we have refrained from estimating the other various expenses save for those whose urgent needs call for immediate attention. We have estimated fresh increases totaling a little over 97 million yen for the relief fund for soldiers' families, various expenses for military aids, various expenses for the protection of wounded soldiers and other expenses required for various other home-front measures. We have also estimated other fresh increases at roughly 56 million yen in the expenses relating to the expansion of productive power, 13 million yen in the expenses relating to the adjustment of the supply and demand of commodities, 18 million yen in the expenses relating to the promotion of export trade, 20 million yen in the expenses needed for the execution of the horse administration plan, 23 million yen in the expenses relating to emigrants to Manchuria, 24 million yen in the expenses relating to civil aviation and air defence.

Moreover, in view of the disastrous floods occurring in various places recently, we have seen an urgent need for expenses relating to river conservation, and we have established a basic plan for the prevention of landslides in all prefectures, working out at the same time river conservation plans for

Digitized by Google

the Tone, Yodo and other rivers. Accordingly we have estimated such amounts as will be required during the forthcoming fiscal year for these purposes.

In addition to these, required amounts have also been estimated to cover expenses relating to remedial measures for those losing employment or forced to change vocations, the expenses relating to the remedial measures for farming villages, the expenses relating to the promotion of medium-sized and small industries, the expenses relating to the enforcement of the compulsory education system at the Seinen Gakko (Young Men's and Women's Schools), etc. Further, the subsidies for local finances are estimated to amount to 130 million yen as in the preceding fiscal year, while, in order to meet the possible necessity of making expenditures in excess of, or outside of, the budget in connection with the Affair or other events, the first reserve fund has been increased by 10 million yen over the preceding fiscal year to 30 million yen and the second reserve fund has been fixed at 60 million yen. Mention may also be made of the amounts saved by cutting or postponing some of the estimated expenses previously fixed for the 1939-40 fiscal year as well as of the amounts saved due to the departure of some army and navy units and war vessels for the war front. These amounts are spread over all Departments of the Government and total a little over 317 million yen. Consequently the budget contains considerable changes in detail as compared with the preceding fiscal year.

Again, the estimated proceeds consequent upon the legislation of the China Affair Special Tax Law and other circumstances total some 351 million yen, showing an increase of 34 million yen as compared with the preceding fiscal year. These proceeds are to be entered in the special account for military expenditures as a financial resource for the provisional war expenses as originally planned. And, if the amount of this estimated entry were left out of calculation, the total amount of revenue and expenditure would be a little over 3,342 million yen.

The deficit in the General Account during the 1939-40 fiscal year will be made good by public loans, which will total roughly 809 million yen including 4 million yen from the Post-Quake Remedial Bonds, 8 million yen from the Road Bonds, and 795 million yen from the Revenue Supplementing Bonds.

Next, a few words on the Special Account Budget. The revenues and expenditures in the five special accounts for Chosen, Taiwan, the Kwantung Leased Territory, Karafuto and the South Seas Mandatory Islands, are all estimated to increase considerably in comparison with the budget figures for the preceding fiscal year. Of these estimated increases, those in revenue are mainly due to increases in tax proceeds, while those in expenditure have been estimated specially to cover such expenses as are deemed urgently necessary in view of the prevailing situation. The other special account budgets have also been compiled in line with the policy followed in the compilation of the General Account Budget.

For transference to the account for emergency military expenditures, 32 million yen has been estimated in the special account of the Chosen Government-General, 16 million yen in that of the Taiwan Government-General, 7 million yen in that of the Kwantung Bureau, 4 million yen in that of the Karafuto Government, 40 million yen in that of the Imperial Government Railways and 16 million yen in that of the Communications Department, totaling 116 million yen.

As for the amounts of public loans to be floated during the forthcoming fiscal year as estimated in the various special accounts, their total is given as 273 million yen, including 164 million yen for the Chosen Government-General, 6 million yen for the Taiwan Government-General, 80 million yen for the Imperial Government Railways and 22 million yen for the Communications Department. If the amount of 809 million yen estimated for public loan in the General Account as stated before, is added to the figures just given, the grand total of projected public loans will amount to 1,028 million yen.

Further, as regards the military expenses relating to the Affair, an additional budget for the special account for emergency military expenditures is expected to be laid before the Diet shortly for legislative approval.

As for the projected general reform of the central and local tax systems, the project has been shelved temporarily following the outbreak of the conflict. Now as the Affair has entered a stage of long-term construction, it is deemed necessary for us to effect readjustments in the tax systems, and therefore we are thinking of pushing careful investigation with sufficient attention paid to the future developments

Digitized by Google

of the situation. In the meantime, however, with a view to increasing the tax burden on industries which are gaining in earnings and at the same time helping in checking consumption, we have planned to effect revisions and increased collections of the temporary profit tax, commodity tax and other similar levies. Accordingly we are now making necessary preparations for the introduction of legislative bills for that purpose to the Diet during its current session.

Next, I take this opportunity to make brief mention of the conditions of economic circles in our country with reference to the situation with which the nation is now confronted.

Since the beginning of the China Affair, huge amounts of Government money have been poured into the financial market, and the Government has made it its basic policy to work for the appropriate and smooth accumulation and movement of capital by such means as encouraging savings and adjusting the supply of capital. Thanks to the understanding and cooperation on the part of the people, these measures are attaining notable results. Meanwhile, the Government is also giving careful thought to the question of when a public loan may be floated or Government money paid out for better results.

Thus, the financial market is making favourable progress with the supply and demand of capital adjusted properly on the whole, and quiet prevails in financial circles. During the year, the average issue of convertible bank notes amounted to 1,919 million yen, which is an increase of 384 million yen as compared with the year before last. But, in view of the fact that this increase was partly due to special causes, I think there is nothing particularly extraordinary about this increase in the issue of convertible bank notes if the recent economic conditions of our country are taken into consideration.

With respect to the people's savings, increases have been notable, bank deposits having increased by 3,370 million yen and postal savings by 689 million yen during the past year. Meanwhile, the call money market has continued to make favourable progress since the early part of last year. In the debenture market, too, considerable activity has been witnessed since its reopening in February last year, the company debentures newly issued totaling 1,160 million yen by the end of the year.

Furthermore, the Temporary Capital Adjustment Law has also continued to be operated smoothly, and the capital invested in industrial equipment during the past twelve-month period exceeded 2,800 million yen, such investments having all been so calculated as to meet the purpose of expanding productive power of most immediate necessity in our country. In the future, too, the demand for capital is expected to continue to rise more and more for the expansion of industrial productivity and other purposes in view of the prevailing situation, and the Government makes it its policy to work for the accumulation of capital by further encouragement of savings, on the one hand, and effect appropriate regulation of capital so as to make the supply of capital for necessary purposes smoother than ever before, on the other.

I also take this opportunity to comment briefly on the invocation of Article 11 of the Law for National General Mobilization. The Government has, after necessary deliberation by the National General Mobilization Council last December, decided to put the provisions of the said article into operation, and is now preparing the drafts of relevant ordinances. In my opinion, in order to carry on long-term construction, it will be necessary to expand the productive power of required materials throughout Japan, Manchoukuo and China. The Temporary Capital Adjustment Law has been put into operation as a means to this end, and in order to meet future developments in the situation, we have deemed it necessary further to improve industrial operations and at the same time to take appropriate measures for active supplies of industrial capital. For this purpose, we are planning to provide appropriate restrictions on company dividends and also have the Government authorized to issue necessary orders to the Japan Industrial Bank regarding advances of capital. We expect these measures, coupled with the operation of the Temporary Capital Adjustment Law, to contribute toward the expansion of productive power and the consolidation of industrial foundations in the future.

Smooth absorption of public loans is a matter of pivotal importance for the operation of State finances, and the Government is paying close attention to this fact. In this connection, it is a matter for congratulation that, thanks to the cooperation of the people, loan absorption has made favourable progress, as approximately 3,800 million

Digitized by Google

yen of public loans have been absorbed during the past year. However, the public loans estimated for flotation during the 1939-40 fiscal year are expected to amount to a gigantic total, and it will be extremely important to effect smooth digestion of them. Under the prevailing situation, this digestion of public loans as well as the projected expansion of productive power throughout Japan, Manchoukuo and China depends largely on the people's savings for necessary capital, and for this reason, we intend to push our studies of various measures, and means to popularize public loans in particular, with the movement for the encouragement of people's savings as their axis.

Next, as regards foreign exchange, I think it most appropriate to maintain the existing exchange standard in view of the internal and international economic situation. In this connection it will be of extreme necessity to strive for improvement in international receipts and payments and for the replenishment of resources to make payments abroad, the latter of which will depend largely on the promotion of the export trade. During last year, the foreign trade of our country amounted to 2,896 million yen in exports and 2,836 million yen in imports, totaling 5,732 million yen. In the trade balance, there was left an export excess of a little over 60 million yen, which was a notable improvement as compared with the import excess for the year before last amounting to 635 million yen. However, we are required to make strenuous efforts to develop our export trade from the viewpoint of the desired acquisition of capital in foreign currency, and for this purpose the Government has already earmarked a portion of the specie reserve of the Bank of Japan to create the foreign exchange fund and is also taking other appropriate measures, which we intend to improve and expand after making sufficient studies.

It is natural that expansion of productive power should have its emphasis on what are known as heavy industries, and it is also of great importance to promote such industries as are connected with the export trade as well as to maintain industries urgently needed for the livelihood of the people. Therefore, the Government is planning to provide appropriately for assuring supply of materials and for the smooth operation of financing for these branches of industries.

In order to balance the international receipts and payments favourably, we are required to work for increased production of newly-mined gold and concentration of gold simultaneously with endeavouring for the promotion of export trade. Having formulated its plan for the increased production of mined gold at an early date, the Government has been working for the increase of newly-mined gold through various measures, and is determined further to render efforts for the realization of the said plan. Meanwhile, the concentration of gold existing within the country is also going on with satisfactory results with the cooperation of various circles . . . .

In recent years, the economic circles of our country have attained remarkable progress, and I think it a matter for sincere felicitations for the benefit of our country to see all economic activities going on quietly and steadily instead of showing uneasiness in connection with the current Affair. However, our nation has now launched itself on its way for long-term construction looking toward an unprecedented fulfilment of our national destiny, and in order to accomplish this task, I think it necessary further to amplify our economic resources and mobilize them all for the single purpose of attaining the desired objective. In other words I think it necessary to adjust and mobilize all production and consumption for the purpose of attaining this national objective.

Change of the Cabinet The Hiranuma Cabinet resigned on August 28, 1939, and the new cabinet under General Nobuyuki Abé was formed on August 30th. As to the members of the Abé Cabinet see p. 103.

CHAPTER VI

FOREIGN RELATIONS

(As regards Japan's foreign relations up to 1914 see the Japan Year Book, 1937, pp. 183–187.)

The Taisho (1911–1926) and Showa Era (1926–)

The World War Less than two months after the outbreak of the European War, Japan participated on the side of the Allies, sending an ultimatum to Germany on August 16, 1914, followed by declarations of war on Germany and Austria on August 23 respectively. Refusing to send troops to Europe, she confined her activities to an attack on the German fort at Tsingtao and the rendering of naval assistance for the protection of allied shipping in the southern Pacific and other waters.

At Tsingtao, the Japanese military and naval forces occupied the German base on November 7, 1914, after operations lasting only a week. In the meantime, the Japanese Navy occupied between October 3 and 19 all islands in the southern Pacific north of the equator with the exception of the island of Yap, which a British squadron had taken before the arrival of the Japanese. From the beginning Japan insisted on occupying these islands permanently, and, in March, 1917, a secret agreement between Japan and Great Britain provided for the permanent occupation of these islands by Japan in return for her despatch of destroyers to the Mediterranean Sea. At the Peace Conference, however, her claim to permanent sovereignty was rejected and she was given only a mandate over the islands.

The Washington Disarmament Conference Japan first participated in international efforts to limit armaments in 1921 at the Washington Conference which opened on November 11. After strongly insisting on a 7–10–10 ratio against the navies of Great Britain and the United States, she accepted a 3–5–5 ratio with regard to capital ships.

At this conference, Secretary Hughes of the United States proposed with regard to capital ships that the United States, Great Britain and Japan scrap respectively 30 ships totaling 845,740 tons, 23 ships totaling 583,375 tons and 17 ships totaling 448,928 tons, including those in course of building, and that the three countries be allowed to retain 506,050 tons in 18 ships, 604,450 tons in 22 ships and 299,700 tons in 10 ships, respectively. After negotiations on the basis of the Hughes proposal, an agreement was reached, with some changes made in the ships to be scrapped. By this agreement Japan was allowed to retain the "Mutsu" instead of the "Settsu" and the United States the "Washington" and the "Colorado" instead of the "North Dakota" and the "Delaware," while Great Britain agreed to scrap four King George V class ships, building two new ships of not more than 35,000 tons each instead. Consequently, the capital ship tonnage which the three Powers were allowed to retain was 525,000 tons in 18 ships for the United States, 581,200 tons in 20 ships for Great Britain and 313,000 tons in 10 ships for Japan.

As regards the replacement of obsolete ships, it was agreed that capital ships might be replaced after 20 years in service, providing that the new ships do not exceed 35,000 tons each in displacement. On completion of the replacement stipulated above, the United states and Great Britain were to have 15 capital ships totaling 525,000 tons each against 9 ships aggregating 315,000 tons for Japan, while France and Italy accepted a total capital ship tonnage of 175,000 tons each.

With regard to auxiliary ships, no agreement was reached on the total tonnage for each country, France claiming 350,000 tons in auxiliary ships and 90,000 tons in submarines, to which Great Britain and the United States were vigorously opposed. The proposal made by Britain favouring the total abolition of submarines added to the difficulties of making a total tonnage agreement regarding auxiliary ships. It was finally decided that an auxiliary ship must not exceed 10,000 tons in displacement and must not carry guns of more than 8 inches in calibre.

As to fortifications and naval bases in the Pacific, it was agreed that the status quo should be maintained.

In addition to the general disarmament treaty the five Powers also concluded an agreement limiting the use of submarines and poison-gas in warfare.

At this conference, Japan was repre-

Digitized by Google

sented by Admiral Baron Tomosaburo Kato, then Minister of Marine, and the treaty was to remain in force until December 31, 1936.

Tri-partite Conference This conference opened on June 20, 1927, and was participated in by Japan, Great Britain and the United States, with a view to settling certain questions left over from the Washington Conference. Japan was represented by Admiral Viscount Makoto Saito, then Governor-General of Chosen. At the outset the three countries presented their respective proposals, when it became evident that there was an almost unsurmountable difference between the claims of Great Britain and the United States.

The Japanese delegate did his best to reconcile the British and American theses, while making it clear that Japan was in no position to accept the 3–5–5 ratio in regard to auxilary ships. In this latter connection, Japan succeeded in reaching a compromise with Great Britain but failed to induce the United States to agree to it. Thus all efforts ended in failure and the three Powers concerned closed the conference after publishing a joint declaration.

The London Conference At the naval disarmament conference called in London on January 21, 1930, in which the United States, Great Britain, Japan, France and Italy participated, the Japanese delegation, headed by Mr. (later Baron) Reijiro Wakatsuki, upheld what they called "the three great principles" of Japan. These were (1) a total tonnage of 8-inch gun cruisers for Japan equal to 70 per cent of that possessed by the United States, (2) no abolition or material reduction of submarines and maintenance of the then existing submarine strength of Japan, i. e. 78,500 tons, and (3) a ratio of 7–10 against the United States in the global tonnage of auxiliary vessels on the basis of the two foregoing conditions.

The conference was fraught with numerous difficulties. In the first place, opinion was divided as to whether global tonnage or different categories of vessels should be taken as the basis for proposed reduction, but this difficulty was overcome by a compromise allowing these two bases of reduction to be discussed simultaneously. By far the greatest difficulty was the difference between the Japanese and American theses, Japan claiming the ratio of 7–10 and the United States insisting on that 5–3. To make the situation still worse, France claimed a global tonnage of 721,400 tons. The American-Japanese entanglement, however, was in a large measure smoothed out through informal conversations between Mr. Tsuneo Matsudaira, Japanese Ambassador in London, and Mr. David A. Reed, of the American delegation.

To summarize the Japanese-American compromise, Japan was accorded a global tonnage of auxiliary vessels equal to 70 per cent of that held by the United States, and in regard to submarines, Japan reduced her claim of 78,500 tons to 52,700 tons on the condition that parity was to be maintained between Japan and the United States in this respect. As for the ratio of 10,000-ton cruisers, Japan was allowed to retain a number of such ships equal to 70 per cent of those possessed by the United States until 1936, while the United States was allowed to lay down the keels of three more ships of this category on condition that they should not be completed during the stated period.

Besides extending the naval holiday for a period of another six years, the London Naval Treaty, which was signed on April 22, 1930, affects Japan in the following respects:

(1) Japan was required to remove from active service the capital ship "Hiéi", although she was allowed to retain it for training purposes.

(2) Japan was allowed to replace the minelayers "Aso" and "Tokiwa", provided that the two new ships should not exceed 5,000 tons in displacement.

(3) Japan was required to dispose of the "Asama", "Yakumo", "Izumo", "Iwaté" and "Kasuga" when the first three vessels of the Kuma class were replaced by new ships.

London Conference in 1935 Japan was represented by Admiral Osami Nagano and Matsuzo Nagai, former Japanese Ambassador to Berlin, at the naval disarmament conference convened at London in 1935, in accordance with the London Naval Treaty of 1930, Part V (2). Admiral Nagano advocated the establishment of a common upper limit of naval armaments to be fixed as low as possible and reduction of offensive armaments to assure the principle of "non-menace and non-aggression." But Japan's proposal failed to obtain support from other nations, and so following the final presentation of Japan's formula and the other delegations' rejection of it, the Japanese delegation informed Viscount Monsell, on January 15, 1936, that it could no longer usefully continue participation in the conference and withdraw from it.

In the meantime, the Japanese Government notified the U. S. A. Government their intention to terminate the

Digitized by Google

Washington Naval Treaty, on December 29, 1935, and all the agreements, except Part IV of the London Naval Treaty, between Japan, Great Britain, U. S. A. and other two nations on the limitation of naval armaments lost force on December 31, 1936.

Following Japan's withdrawal from the London Naval Conference of 1936 because of her inability to agree to qualitative rather than quantitative disarmament, the so-called "Naval Treaty of 1936" was concluded among Great Britain, the United States, France and Italy. The Japanese Government was invited by the British Government to become an adherent to the Treaty, but on June 28, 1937, it notified the British Government that it was unable to do so.

Prior to the Japanese notice and anticipating Japan's refusal to participate in the new treaty, the British Government notified the Governments of Japan and the United States that Britain would maintain a surplus of 40,000 tons in destroyers and transfer 4 ships from the category of "A" class cruisers to that of "B" class cruisers. In reply, the United States announced its intention to apply the escalator clause. To meet the increased tonnages of Britain and America, the Japanese Government decided to maintain a surplus tonnage in destroyers and submarines and notified the British Governments to that effect on August 31. The Japanese notice contained the following three major points:

1. The Imperial Japanese Government acknowledges receipt of the British notice that Britain will maintain a surplus of 40,000 tons in destroyers.

2. The Japanese Government wishes to give notice that Japan will maintain a surplus of a total of 26,657 tons including 11,059 tons in destroyers and 15,598 tons in submarines.

3. The Japanese Government requires the maintenence of a surplus tonnage in submarines in consideration of the fact that the surplus tonnage in destroyers is comparatively small.

On September 3, the Japanese Government notified the Government of the United States to the following effect:

"In view of the fact that the British Government has notified of its intention to maintain a surplus of 40,000 tons in destroyers through the invocation of Article 21 of the London Naval Treaty, the Japanese Government also intends to maintain a surplus tonnage in destroyers and submarines through the exercise of its treaty rights.

"According to the fixed ratio, the Japanese Government is entitled to the maintenance of a surplus of 28,000 tons in destroyers. As the surplus tonnage in destroyers does not reach these figures, the Japanese Government desires to effect a transfer of tonnage by maintaining a surplus of 15,598 tons in submarines in addition to the surplus of 11,059 tons in destroyers."

Limitation of Use of Submarines A procès-verbal was signed on November 6, concerning the continuance of the provisions in Chapter 4 of the London Naval Treaty which limit the use of submarines. The Japanese Government also participated in the procès-verbal. Other participants include Great Britain, the United States, France and Italy.

Limitation of Gun Calibre. Following Japan's refusal to participate in the London Naval Treaty of 1936, the British Government tried to persuade the Japanese Government to accept the provisions limiting the calibre of guns mounted on capital ships to 14 inches, at the least. The Japanese Government, however, declined to agree to such limitation. On March 27, 1937, Foreign Minister Naotaké Sato handed a note to Sir Robert Clive, the British Ambassador in Tokyo, which read in substance as follows:

"As clarified at the London Naval Conference, the Japanese Government is not in a position to agree to a qualitative limitation of naval armaments which is not accompanied by a quantitative limitation. As no need is recognized for a change in the principle which it set forth at the London Naval Conference, the Japanese Government cannot accept the proposal to limit the gun calibre without limiting the quantity of naval armaments."

The League Disarmament Conference Late in 1932, when the general disarmament conference was called at Geneva after years of preparation by the disarmament commission of the League of Nations, Japan also submitted a plan of her own with regard to naval limitation and reduction. This proposal, which was published on December 11, 1932, made it known that Japan was desirous of making it the guiding principle of the conference that offensive power should be reduced and that the geographical and other special circumstances of each country should be fully taken into consideration in making any settlement.

As regards the formula of the projected agreement, Japan proposed to divide it into general and special agreements. In the general agreement, it was proposed to arrange for the qualita-

Digitized by Google

tive reduction of all vessels, and also the quantitative reduction of "offensive" vessels, belonging to Japan, Great Britain, the United States, France and Italy.

With regard to the special agreement, all the countries of the world should be divided into four groups, under (1) the Pacific group, (2) the Atlantic group, (3) the European group and (4) the South American group; and each group should arrange for limitation and reduction of the armament of each of its members. Any country interested in more than one group should participate in the disarmament discussions of all groups in which it is interested.

Relations with Great Britain

Abrogation of 1905 Convention The trade relations between Japan and India received a serious setback in 1933 when notice was served Japan in April through the British Government of the abrogation on October 10, 1933, of the Indo-Japanese Trade Convention of 1905.

This step was followed by an increase of the import duty of the Indian Government on Japanese cotton fabrics from 50 per cent to 75 per cent ad valorem on June 6, 1933. The duty on British cotton fabrics remained at 25 per cent. This drastic action on the part of the Indian Government caused the Japanese cotton spinners to boycott Indian cotton, and the situation was such that the British Government suggested the opening of negotiations between the industrial and trade interests of Japan, India and Great Britain in the hope of finding a solution.

Simla Conference Opinion was divided among industrialists in Japan with regard to acceptance of the British proposal, but it was finally decided to send representatives both to London and Simla to confer with representatives of the British and Indian interests. For the Simla conference, which was scheduled to be held on September 22, with the British and Indian delegates present, Mr. Setsuzo Sawada, former chief of the Japanese Bureau of the League of Nations, Mr. Susumu Terao, chief of the Trade Bureau of the Commerce and Industry Ministry, and Mr. Tetsuichiro Miyaké, Consul-General at Calcutta, were appointed to represent the Japanese Government, although they were not given full powers because the British Government had made it known that any agreement to be reached at Simla was subject to the approval of the British Government, while no official assurance was obtainable as to whether such an agreement would be adopted by the British Government without modification.

The Agreement Negotiations were not easy due to conflicts of interests of the two countries and more than 3 months was spent before it came to the final agreement of January 5, 1934, at New Delhi. Agreement was reached on various important problems relative to the commerce between Japan and India, including: (1) most-favoured-nation treatment; (2) a provision to open negotiations with a view to modifying customs tariff; (3) measures to be taken to adjust the effects of the exchange fluctuations; (4) customs duties applicable to Japanese cotton piece-goods imported into India; (5) a quota to be applied to the same; and (6) enforcement of the agreement entered into. The gist of the agreement follows:[1]

(1) Customs duties to be imposed on Japanese cotton piecegoods should not exceed following rates.

Duty on plain greys	50 per cent. ad valorem or 5.25 annas per pound
Duty on others	50 per cent. ad valorem

It is understood that the Government of India shall not impose on Japanese cotton piece-goods other than plain greys a specific duty exceeding 5.25 annas per pound subject to agreement concerning most-favoured-nation treatment.

(2) Basic quota of Japanese cotton piece-goods to be exported to India in a piece-goods year shall be 325,000,000 yards, and it shall be linked with 1,000,000 bales of Indian raw cotton exported to Japan in corresponding cotton year.

(3) Treaty shall come into force immediately after exchange of ratifications and shall remain in force until March 31, 1937.

The Indo-Japanese Trade Agreement was signed in London on July 12, 1934.

Revision of the Convention According to the proposal of the Japanese Government, which presented on April 24, 1936, for revision of the Japanese-Indian convention, negotations were opened between Mr. Yonezawa, the Japanese Consul-General at Simla and the Commercial Secretary of the Government of India on July 20. After the commencement of the negotiations the British Gov-

1 For particulars of the agreement see "Commercial Treaty between Japan and India" (Appendix).

Digitized by Google

ernment notified the Japanese Government on October 21 of its intention to abrogate the Japanese-Indian convention of July 12, 1934. Consequently the Japanese-Indian negotiations were continued at Delhi and resulted in an agreement.

In regard to the Japanese-Indian agreement which was signed provisionally on April 12 the Japanese Government issued a statement reading as follows :

Anglo-Japanese Trade Issue (See the Japan Year Book, 1935, pp. 195, 196.)

With reference to an adjustment of the relations between Japan and Great Britain, Mr. Shigeru Yoshida, the Japanese Ambassador at London, started his activities in May, 1936, utilizing every occasion available for taking up the question with the British Authorities. As trade relations between the two nations are considered the principal factor responsible for the aggravation of the Anglo-Japanese relations, an Anglo-Japanese trade commission was created to try and adjust any trade differences. The commission held its first meeting on November 4, when, attended by 20 British and Japanese members, an exchange of views took place.

On April 11, 1937, the Keelung affair involving the trouble caused between some sailors belonging to the British Far Eastern Squadron and the police authorities in Keelung, which had been pending since October, 1936, was settled and the seemingly strained situation was greatly eased. To add to the influence brightening the prospects of Anglo-Japanese relations, the coronation of King George VI was held in London in May with Prince Chichibu attending on behalf of the Emperor of Japan, thereby renewing the friendship between the British Royal Family and the Japanese Imperial Family.

The Ladybird Incident On December 12, 1937, British men-of-war the Ladybird, the Bee, the Cricket and the Scarab were by mistake subjected to gunfire and aerial bombing by Japanese forces in the vicinities of Wuhu and Nanking in the course of Japanese attack on Nanking. On December 14, Foreign Minister Koki Hirota presented a note of apologies to Ambassador Sir Robert L. Craigie assuring that the Japanese Government had already taken necessary steps to prevent the recurrence of an incident of such character, that it would, upon the completion of investigations, deal appropriately with those responsible for the incident, and that it was prepared to make necessary indemnification for the losses sustained by the British.

On December 16, the British Government requested the Japanese Government, through Ambassador Craigie, an assurance that the contents of Japanese Foreign Minister's note of December 14 would apply to the attacks upon the British merchant vessels, and stated that the British Government took particular note of the point that those responsible would be suitably dealt with, and desired that the British Government would be informed that measures had been actually taken of a character which would put a definite stop to similar incidents. On December 28, Foreign Minister Hirota handed a reply to the British Ambassador assuring that what was said in the note of December 14 would of course apply to the British merchant vessels, that although it had been established, as a result of thorough investigations, that the incidents had been entirely due to a mistake, the Japanese Government have dealt properly according to law with all those of the Navy including the commander of the flying force, that the higher commanding officer of the Army and the Navy issued strict orders to the forces not to attack any vessels on the Yangtze unless they have been fully identified as those used for military purposes by Chinese, and that the Japanese Government was studying and expected to carry out every possible means of realizing the aims of safeguarding life and property of third nationals.

On December 31 the British Ambassador sent a final note to the Foreign Minister informing the latter that the British Government noted with appreciation the assurances contained in the Japanese note of December 28 and learned with satisfaction that the statements of the Japanese note of December 14 applied to merchant vessels as well as to warships and also that the Japanese Government had taken or was prepared to take the necessary disciplinary measures to prevent any repetition of such incidents.

Navigation on the Yangtze In connection with restoration of commerce and navigation of vessels of third Powers on the Yangtze River, the Ambassadors of Great Britain, the United States and France in Tokyo respectively presented notes of proposals to the Japanese Government on November 7, 1938.

Foreign Minister Hachiro Arita handed official notes to the Ambassadors of the Powers concerned, on November 14, replying that, although the Japanese Government had no intention of ham-

Digitized by Google

pering deliberately the commerce and navigation of third Powers on the Yangtze, it held that the time had not yet arrived to warrant general opening of the river because of the following reasons:

1. The blockade at Kiangyin had not been opened beyond the stage where the river could be used for military purposes. For the time being, only navigation by Japanese warships and vessels for military purposes was possible.

2. Large-scale military operations were in progress above Hankow, and points between Shanghai and the upper river form an important commissary line. Navigation by commercial vessels in general would have seriously hampered Japanese military operations.

3. Areas along the Yangtze were infested with Chinese guerrillas, who frequently attacked Japanese warships and other vessels.

4. The Chinese forces frequently laid mines, taking the Japanese unawares, and navigation on the river was consequently very dangerous. This was indicated by the incident in which a vessel being used for military purposes was sunk.

5. It would take some time before Chinese mines had been completely cleared from the river and necessary navigation marks had been restored to normal.

Japano-Canadian Trade Relations

Japan applied the Commerce Adjustment and safeguarding Law against the Canadian goods in July, 1935 in answer to the latter's placing prohibitive high tariff walls against the Japanese goods. Circumstances surrounding the matter were treated in the Japan Year Book of 1935, pp. 442-445. Even then there was an indication that a new agreement would be arranged between the two countries. In the meantime negotiations were made between Minister Kato and Premier King and a new agreement was made on December 26, 1935, which has been in operation since January 1, 1936. The substance of the agreement is as follows:

The Canadian Government, in accordance with the general policy respecting trade and tariff matters, decided to make the following modifications in its customs regulation:

1. The classification "goods of a class or kind made or produced in Canada," as it appears in the Customs Tariff, will be restricted to goods which are of a class or kind made or produced in commercial quantities sufficient to supply at least ten per cent of the normal Canadian consumption.

Adequate notice will be given of the transfer for customs purposes of a product from the category "not of a class or kind made or produced in Canada" to the category "of a class or kind made or produced in Canada."

2. In computing the value for duty of goods of a class or kind not made or produced in Canada, the value of the Yen will be the current exchange value in terms of the Canadian dollar at the time the goods were exported to Canada.

3. In computing the value for ordinary duty and for special duty under Section 6 of the Customs Tariff of goods of a class or kind made or produced in Canada the value of the Yen during the twelve months beginning January 1, 1936, will be at the rate of 39.5 cents; being the average exchange value of the Yen in terms of the Canadian dollar, for the five-year period 1930-34, besed on the exchange rates published in the Statistical Year Book of the League of Nations.

For the succeeding twelve-month period the Yen will be taken at the average exchange value for the five-year period 1931-35, computed on the same basis, and similarly for each succeeding year. It is understood, of course, that if the Yen should reach a value in Canadian currency higher than the value set forth or provided for above, such value would thereupon cease to apply and would be replaced by the current exchange value.

4. The values established under authority of Section 43 of the Customs Act will be cancelled on January 1, 1936, on an extensive list of commodities.

5. Opportunity will be afforded for appeal to the Tariff Board of Canada respecting any value for duty which may in future be established under Section 43 of the Customs Act. In the event of such an appeal the value for duty in force will, upon the expiration of three months after the date of appeal, cease to have any force or effect unless the Tariff Board, following a public inquiry, finds that such value or some lower value is required to prevent the importation of the goods into Canada from prejudicially or injuriously affecting the interests of Canadian producers or manufactures. If a lower value is found by the Tariff Board to be appropriate such lower value will promptly become effective.

The Canadian Government has decided to cancel on January 1, 1936, the surtax of 33 1/3 per cent ad valorem levied on goods the produce or manufacture of

Digitized by Google

Japan under the regulations made by Order in Council P.C. 2108 of July 22, 1935, as modified by Order in Council P. C. 2317 of August 3, 1935.

The Japanese Government decided to cancel, on January 1, 1936, the surtax of 50 per cent ad valorem levied on certain goods the produce or manufacture of Canada under the provisions of the Imperial Ordinance No. 208, 1935 and the proclamation No. 162 of the Department of Finance of Japan of July 20, 1935.

Trade Relations Between Japan and Australia

Japan was again compelled to apply the Commerce Adjustment and Safeguarding Law or Trade Protection Law (given in full at the end of Chapter XI) against Australia on June 25, 1936, under the circumstances explained in the declaration of the Japanese Government, full text of which was given in the Japan Year Book, 1936, pp.198–200. But the negotiations since succeeded in bringing about a provisional agreement between the two countries on December 26, 1936, and the Government of the Commonwealth of Australia decided to take the following actions as on and from January 1, 1937, in relation to trade between Australia and Japan :—

1. The Commonwealth Government will repeal the Statutory Rule No. 92 of 1936 notified in the Commonwealth Gazette on July 8, 1936.

2. The Commonwealth Government will reduce the existing intermediate tariff rates on cotton piece-goods and artificial silk piece-goods admissible under the following items of the Australian Customs Tariff 1933–1936 :—

Cotton piece goods
Tariff item 105 (A) (1) (a)
105 (A) (1) (c)
105 (A) (1) (d)
105 (B)
105 (C)
120 (D) (1)
130 (B) (1)
Artificial silk piece goods
Tariff item 105 (D) (1) (b)
To the following rates, viz.:—
Cotton piece goods
Unbleached 1¼ d per square yard
Bleached, 1½d per square yard
Printed dyed or coloured 2 d per square yard
Artificial silk piece goods
4 d per square yard

3. The Commonwealth Government, in addition to according Japan the benefits of Australian intermediate tariff on cotton piece-goods and artificial silk piece-goods admissible under the aforesaid items of the Australian Customs Tariff, will accord to Japan the benefits of Australian intermediate tariff on cotton piece-goods and artificial silk piece-goods admissible under the items 105 (A) (1) (e), 105 (A) (3) and 105 (A) (4).

4. The Commonwealth Government will exempt from primage duty Japanese cotton piece-goods and artificial silk piece-goods admissible in accordance with the decisions set out in paragraphs (2) and (3).

5. During the period January 1, 1937 to June 30, 1938, the Commonwealth Government will permit importation into Australia of 76,875,000 square yards of Japanese cotton piece-goods (other than calico for bag-making admissible under the tariff item 105 (A) (2) and 76,875,000 square yards of Japanese artificial silk piece-goods at the rate of 51,250,000 square yards for each of the two classes of piece-goods per annum.

Any cotton piece-goods or any artificial piece-goods exported from Japan within the quota allotment during the period ending June 30, 1938, but not arriving in Australia until after that date, will be admitted into Australia provided they are imported into Australia not later than September 30, 1938.

In answer to the above the Japanese Government decided to take the following actions as on and from January 1, 1937, in relation to trade between Japan and Australia:

1. The Japanese Government will cancel the surtax of 50 per cent ad valorem and abolish the licensing system provided in the Imperial Ordinance No. 124, 1936.

2. The Japanese Government will permit importation into Japan from Australia during the period ending June 30, 1938, of not less than 800,000 bales of Australian sheep's wool. Any sheep's wool exported from Australia for which import permission has been accorded during the period ending June 30, 1938, but which does not arrive in Japan until after that date, will be admitted into Japan, provided such wool is imported into Japan not later than September 30, 1938.

Japan-Dutch Conference

On the heels of the Indo-Japanese trade conference, Japan decided to negotiate on trade terms with Holland. In the talks at The Hague in December, 1933, between the Dutch Premier and Japanese diplomatic representatives, it

Digitized by Google

was decided that Japanese and Dutch delegations negotiate in Java on the trade relations of Japan and the Dutch East Indies and that the outcome of their discussions be further debated at The Hague by representatives of both governments.

Dutch East Indies constitute one of Japan's most important markets, and since 1932 they had been taking more from this country than from Holland itself, a situation that naturally led the Dutch industrialists to campaign for restrictions against Japanese commodities.

With the purpose, on the part of the Dutch East Indies, to adjust the one sided trade relation with Japan for it bought ¥157,487,000 and sold ¥55,709,000 in 1933, the Japan-Dutch trade conference was opened at Batavia on June 8, 1934.

General committee meetings were opened on June 26 and adjourned indefinitely without any result on December 21, 1934.

Shipping Conference For some time since 1931 there had been a very severe competition in freight business between the Java, China and Japan Line and the Japanese shipping companies. In order to improve the situation freight conference had been arranged towards the close of 1932 between the abovementioned Dutch Line and the Japanese shipping interests. In 1934 parties interested in the quota system of cargoes held a conference at Kobé. After the Japan-Dutch Conference, a new Conference was held at Kobé in February, 1935. But before going to discuss any question of practical importance the conference came to a deadlock as soon as the question of language to be used came up, and, on February 22, the Conference was adjourned.

Since the rupture of the Kobé Conference the Dutch Government barred imports of the Japanese goods through the issuance of ordinances restricting imports and business, and through a restriction placed on handling of imported goods by the Japanese companies, which resulted in a marked decrease of imports of Japanese goods, the former ratio of trade between Japan and the Dutch East Indies which was 3 to 1 having been changed to 2 to 1.

The freight conference on Japan-Java-Line expired in June, 1935 and the freight competition became very severe. Japan then established the Nanyo Kaiun Kaisha, Ltd., with the Ishihara Sangyo, the Nanyo Yusen, and the Osaka Shosen as its investing companies. The result, however, was adverse to Japanese shipping companies. The ratio of placing of steamers which was 7 to 8 in Japan's favour has become 3 to 2.

In November of 1935 a shipping conference was held at Kobé, but both sides stuck to their own views and the conference brought about no satisfactory result. Later the matter was taken up again by the Japanese Consul-General Mr. Ishikawa at Batavia with the officials of the Dutch Government, and on June, 1936 an agreement was made between the two countries. According to this new agreement, the Japanese steamers have been enabled to load 64.28 per cent of the outgoing cargoes and 60 per cent of incoming cargoes.

The Japanese-Dutch negotiations entered their main stage in the autumn of 1936 and on April 9, 1937 an agreement of opinion was reached between the Japanese and Dutch representatives. Thus after three years' efforts, the negotiations between the two countries were brought to a successful end. It was decided that the new agreement should be signed formally at The Hague as a supplement to the Japanese-Dutch Treaty of Commerce and Navigation of 1931.

Relations with Soviet Russia

After the Siberian expedition in which Japan participated from 1918 until 1920, diplomatic relations were not restored between the Japanese and Russian Governments until 1924, although Japan had withdrawn her troops from Siberia a few years previously.

After her participation in the World War, Japan concluded an agreement with Russia on July 3, 1916 for the purpose of preventing Russia from making peace with Germany independently of the other Allies. At this time there was a rumour that the two countries had concluded an offensive and defensive alliance. Following the establishment of the communist régime in Russia, in 1917, Japan sent the 3rd and the 12th divisions and a part of the 7th division to Siberia between August and October of 1918, in compliance with a proposal from the United States, in order to enable some 50,000 Czechoslovak troops (formerly prisoners of war taken by the Russians from the Austrian armies) to establish contact with the allied armies in the East. This expedition automatically disrupted the diplomatic relations between Japan and Russia, and even after the Czechoslovak troops had re-established liaison with the other allied armies, the Japanese remained in Siberia with fresh troops relieving the first expeditionary forces. The American and other foreign troops were withdrawn early in 1920, but Ja-

Digitized by Google

pan in spite of the demand for withdrawal by the Soviet Government of Irkutsk on March 11, 1920, continued to station her troops in the vicinity of Vladivostok and Habarovsk for the professed purpose of protecting the Japanese residents there. On March 18 and 19, 1920, partisan troops attacked the Japanese consulate, Nikolaevsk, killing all the officials and guards. On March 31, the Japanese Government issued a statement to the effect that Japan had no territorial designs in Siberia, but that the withdrawal of troops was impossible in the circumstances. Japan maintained relations with the Far Eastern Republic, constituted an independent state in February, 1921, until January, 1922, when this region was incorporated in the U. S. S. R.

With a view to restoring diplomatic relations with Soviet Russia, with which she shared interests on the Asiatic mainland, Japan undertook to negotiate with the Russian representatives on several occasions at Changchun and Dairen. Such efforts were resumed in 1923 in Tokyo, where M. Joffe and Mr. Toshihiko Kawakami met in conference officially representing Soviet Russia and Japan through the good offices of Count Shimpéi Goto, but no satisfactory results were forthcoming. It was at Peking that the diplomatic relations between the two countries were resumed officially on January 20, 1925, when Mr. Kenkichi Yoshizawa, the Japanese Minister there, succeeded in concluding an agreement with M. Karakhan, the Soviet representative, after seven months' negotiations.

The Fishery Dispute The first fishery convention between the two countries had been concluded in 1907, and after the resumption of Soviet-Japanese relations, efforts were made for its revision and, following the visit to Russia by Count Shimpéi Goto in this connection, the revised convention was signed on January 24, 1928, remedying such provisions as had proved disadvantageous to the Japanese and otherwise improving the pact to meet the new situation. However, this revision was later found to be imperfect and disputes arose one after another between the Japanese fishing interests and the Soviet authorities regarding the details of the fishery convention.

Among other issues in this connection the most notable in recent years was that concerning the exchange rate of the rouble. This dispute originated in the inspection of the Vladivostok office of the Bank of Chosen by the local Soviet authorities and the subsequent prohibition of free transactions in rouble exchange. As a result, the Japanese fishing interests, which had been paying various taxes and rates to the Soviet authorities with Soviet currency obtainable at the Vladivostok office of the Bank of Chosen at depreciated exchange rates, now faced the necessity of exchanging the yen for the rouble at an official rate five or six times higher than the open market value. In order to settle this problem, the Japanese Government demanded that either the rents of the fishing leases or the official exchange value of the rouble be reduced, and this proposal was followed by prolonged negotiations in Moscow and Tokyo.

The negotiations were started in Moscow in October, 1930, but soon afterwards the Soviet Ambassador to Japan, M. Troianovsky, took up the dispute in Tokyo, and communicated the willingness of his Government to reduce the official exchange rate of the rouble by 25 per cent, when selling debentures of the state operated corporation, Aco (in charge of the Russian fishery interests), fixing the rate at 75 sen in Japanese currency. In reply Japan insisted on the rate of 30 sen per rouble, and negotiations continued until April 28, 1931, when a compromise was reached providing that the payments of the Japanese fishing interests to the Soviet authorities during the year of 1931 should be made with Aco debentures to be purchased at the rate of 32.5 sen per rouble.

In view of this dispute and other difficulties arising from the differences between the two countries in the interpretation of the provisions of the Fishery Convention, Japan proposed on June 22, 1931, to open a conference with Soviet Russia to reconsider the whole convention. After a delay of five months, Soviet Russia consented to negotiate with Japan and pourparlers were started between Mr. Koki Hirota, the Japanese Ambassador, and M. Karakhan, Assistant Commissar of Foreign Affairs of Soviet Russia, on November 27, 1931. No substantial progress, however, was made during the negotiations, which were carried on with frequent interruptions for several months.

On February 20, 1934, the auction for the current year of the fishery grounds was held at Vladivostok. Bids were submitted by both Japanese and Soviets. The Soviets, however, declared that the Japanese bids were unacceptable, because they were accompanied by a guarantee made out at the rate of 32.5 sen, instead of 75 sen ruled by the

Digitized by Google

Vladivostok fishery authorities, per ruble, and the Soviets' bids, which numbered 60, were accepted as valid. The reason that the Japanese interests insisted upon a 32.5 sen rate of exchange is based upon a provision in the Shidéhara-Troianovsky Agreement of April 26, 1931.

On February 25 the Russian authorities proposed a compromise which purported to permit Japanese bidders to enter new offers at 32.5 sen on February 28 for the remaining 66 fishing grounds, provided that the exchange rate question would be held open for future negotiations. This was accepted by the Japanese interests and the grounds were given them at the auction held on May 20.

The question of yen-ruble exchange still remained and negotiations to settle the matter were opened on June 17 at Moscow, from then up to February 21, 1935, the negotiations were held 15 times. As Japan thought it necessary to revise it, the Foreign Office caused Ambassador Tamékichi Ohta, in Moscow, to make a proposal to the Moscow Government in May, 1935, one year prior to the date of maturity, in conformity with Article XV of the treaty, for its revision.

On April 26, 1936 the Japanese Government proposed, at the conference held at the Embassy at Moscow, between the councillor Sako and Mr. B. I. Kozlovsky, second head of the eastern department of the Foreign Commissariat, to revise the 1928 fishery convention and to extend 1932 Hirota-Karakhan agreement for 12 years, which the Soviet declined. As the basic claim of Japan was not heeded the negotiation was impossible to come to a satisfactory close before May 27, which was the final date set for the revision of the convention. However, a provisional agreement for the extension of the 1928 convention was signed at Moscow on May 25. According to this agreement, the present convention has become valid till December 31, 1936.

Non-Aggression Pact Proposal (See the Japan Year Book, 1935, p. 199.)

Negotiations for Sale of the N. M. R. Through the good offices of the Japanese Government a conference was opened in Tokyo on June 26, 1933, between representatives of Soviet Russia and Manchoukuo regarding the proposed sale of the North Manchuria Railway (formerly the Chinese Eastern Railway). Japan took no active part in the railway negotiations, except that a few Japanese officials attended the sessions as observers.

According to a memorandum stating the fundamental principles for the transfer of the North Manchuria Railway submitted by the Soviet Russia at the third official meeting held on July 4, 1933, the sale price was put at 250,000,000 gold roubles. The price offered by Manchoukuo was ¥50,000,000. The Soviet side based its calculation on the amount of its investment totalling 411,690,000 gold roubles up to 1932 and, taking into consideration the depreciation of economic value of the railway and its condition of damage, it finally estimated the total amount of transfer at 250,000,000 gold roubles. The Manchurian side appraised the value on the basis of the prevailing construction cost. In March, 1934, the Soviet side brought down the price to ¥200,000,000, but the Manchurian side lowered it to ¥100,000,000 in April of that year. Through mutual concession, the price was fixed at ¥170,000,000 on September 21, 1934. During the intervening period Foreign Minister Koki Hirota held interviews with Ambassador Youreneff ten times and Mr. Shigénori Togo, Director of the Europe and Asia Bureau, of the Foreign Office, saw M. Benedict I. Kazlovsky, one of the Soviet delegates, eight times on negotiations. Finally, the negotiations were concluded on January 21, 1935, and on March 23 the signing of the agreement took place at the official residence of the Foreign Minister in Tokyo. (The Agreement is given in full in the Appendix.)

North Saghalien Oil Concession The North Saghalien Oil Concession contract, based on Article VI of the Japanese-Soviet Basic Treaty, concluded in October, 1925, has proved very disadvantageous to Japan as well as the Japanese-Soviet Fishery Treaty. The whole area where oil prospecting is to be undertaken is divided like a checker board. If one bloc of the board is assigned for Japan to prospect, the adjoining bloc is claimed by the Soviet side as its prospecting field. When Japan succeeds in turning out oil by prospecting, paying an enormous amount of expenses, and changes it into an oil mining section, the Soviet side enlists the adjoining bloc into its oil fields, thus profiting without much trouble and expenses. It is also disadvantageously provided for in the treaty that the term of oil prospecting in unexploited fields covering an area of 1,000 versts in Ocha districts is fixed at only 10 years. Moreover, North Saghalien is open to the practicability of actual work for a brief period of only two or three months during summer. The actual period of

Digitized by Google

operation throughout 10 years is therefore only about 20 or 30 months. The term would have matured at the end of 1936. The North Saghalien Oil Company had been negotiating with the Soviet Government for extension of the term of prospecting since about seven years ago.

Oil Prospecting Rights Negotiations were opened between the president of the Karafuto Petroleum Company and the authorities of the Soviet People's Commissariat for Heavy Industries in the spring of 1936, which resulted in an understanding to extend the term of the Japanese right to prospect the oil resources in the northern half of Saghalien by five years. Documents containing detailed items of the understanding were signed at Moscow on October 10, 1936, between the president of the Japanese company and the Soviet People's Commissar for Heavy Industries.

Changkufeng Incident A border trouble with the U. S. S. R. occurred at Changkufeng hill of Manchoukuo by the occupation of the hill by Soviet forces on July 12, 1938. Actual hostilities between Japanese and Soviet forces began at the end of July and continued for about 10 days. Despite its numerical inferiority, an unnamed detachment of the Japanese army repulsed attacks by the Soviets and held its position to the last. The Soviets mobilized three divisions of sharpshooters, 200 tanks and sent more than 100 airplanes.

During the 10 days of sustained engagements, a division of Soviet snipers was destroyed and about 100 tanks put out of commission. Without sending up a single machine, the Japanese brought down six Soviet planes. The Japanese casualties totalled 890.

On August 4, Mr. Kensuké Horinouchi, Vice-Minister for Foreign Affairs, invited the Soviet Charge d'Affairs, Mr. Constantin Smetanin to the Foreign Office and made proposals to him for the cessation of hostilities and requested Mr. Smetanin to transmit the same promptly to his home Government and obtain its reply thereto.

At the same time the Japanese Government ordered Ambassador Shigemitsu in Moscow to enter into negotiations with Foreign Commissar Litvinoff for a quick settlement of the matter. At the end of the conversation between them on the night of August 10, 1938, the following agreement was concluded:

1. Both Japanese and Soviet forces shall cease all hostile operations as from noon (Maritime Province time), August 11.

2. Japanese and Soviet forces are to maintain the lines held by them at midnight, August 10.

3. The details of the truce agreement are to be arranged by representatives of the two forces on the spot.

Revision of Fishery Agreement Although the German-Japanese agreement was directed against the Comintern, with which the Soviet Government declared itself to have nothing to do, and was aimed at the creation of a common German-Japanese front against Communism, the Soviet Government suspected that the pact were directed against the Soviet Union. Out of this suspicion, the Soviet Government went the length of refusing to sign a new fishery agreement with Japan, which had already been initialled. As a result, the Soviet-Japanese situation was greatly aggravated because it became impossible to enforce a new agreement to replace the Soviet-Japanese Fishery Agreement and the Hirota-Karakhan Agreement, both scheduled to expire at the end of 1936. The situation was rectified only by making provisional arrangements for the extension of the terms of the said two agreements by one year.

Official documents embodying the provisional arrangements were signed at Moscow on December 28, 1936, between Mr. Mamoru Shigemitsu, the Japanese Ambassador to the U. S. S. R., and Mr. Stomoniakov, the Soviet Assistant People's Commissar for Foreign Affairs, on December 28. At the end of 1937, Japan was again obliged to conclude a modus vivendi, owing to the attitude of the Soviet authorities.

In 1938 and 1939, negotiations on the fishery question were again carried on between the Japanese Ambassador to Moscow and the Foreign Commissar of the Soviet Russia, and came to a satisfactory conclusion on April 2, 1939. A modus vivendi was accordingly signed at midnight by Ambassador Togo and Foreign Commissar Litvinoff, and the Japanese participated in the auction of fishery areas in the northern waters held at Vladivostok on April 4. The results of the agreement may be summarized as follows:

(A) The Fishery Convention of 1928 remains in force until the end of this year.

(B) The contract for the special contract fishery lots is extended another year with the exception of four exempted lots, concerning which mention will be made later.

(C) As to stabilized fishery lots they are placed on auction with the excep-

Digitized by Google

tion of the exempted lots, of which mention will be made later, but

(a) The definite prospect is that Japanese fishing interests will acquire them.

(b) These acquired lots will be under lease for five years.

(c) The rent is not to be raised more than ten per cent.

(d) The four lots which were successfully bidden by the Soviet side on March 15th, are to be returned to the Japanese.

(D) The exempted fishery lots:

Thirty-seven fishery lots consisting of thirty-two of the stabilized lots, four of the special lots, and one of the lots under lease are exempted from auction as exceptions to Article 8 of the Protocol A of the Fishery Convention. But against these lots ten substitute lots are offered, nine of which are to be leased for five years by auction.

(E) The nine Japanese fishery lots which have been placed on auction because their lease expired will be successfully bidden by the Japanese for the term of five years.

(F) The fifty-two fishery lots which have been still under lease will continue to be leased by the Japanese.

(G) The rate of rouble exchange remains the same as before.

To sum up, the Japanese side has acceded to the Soviet contention regarding the placing of the so-called stabilized lots on auction because the term of their lease has expired. But the Japanese will successfully bid for all the fishery lots except the exempted ones and secure the stabilization of the fishery lots for five years. As for the exempted fishery lots, although we are not to operate twenty-seven of them, we can operate about three hundred and sixty fishery lots. In other words, Japan has acquired as the result of the recent negotiations about three hundred and sixty fishery lots in all, of which two hundred and sixty-four are to be stabilized for five years.

Relations with the United States

The mutual friendship of Japan and the United States largely hinges upon their respective interests on the Asiatic continent, most notably in Manchuria and China proper. The United States first made it known in 1899 that she had an equal claim in China to that of other Powers by advocating the so-called open door policy. The United States thought it necessary to assert this principle in order to catch up with the other Powers, which had already acquired extensive interest in China, and it followed naturally that the Americans should sympathize with Japan in her desperate attempt in 1904–5 to force Russia out of Manchuria and leave the region open to all nations interested.

The Four-Power Treaty For the same reason the United States objected to Japan's occupation of Shantung during the World War. The result was that Japan formally restored the territory to China on May 17, 1919 and at the Washington Conference, 1921–22, agreed to complete evacuation thereof. The Four-Power Treaty concerning the insular possessions of the signatories in the Pacific and the Nine-Power Treaty regarding the sovereignty and the open door principle of China, which were signed at the Washington Conference, also had a more important bearing upon Japan and the United States than on the other signatories. The Four-Power Treaty provided that the signatories should mutually respect the right of the Powers regarding their respective insular possessions in the Pacific and also that in case a dispute arose regarding such rights with likelihood to prove detrimental to the peaceful relations between the powers concerned, the parties involved in such a dispute should call a joint conference of the other signatories to discuss settlement of the entire issue. So far as Japan is concerned, however, this provision applies only to Karafuto, the Pescadores and her mandated islands in the Southern Pacific. The most important provision in this treaty for Japan is embodied in its fourth article which stipulates that the Anglo-Japanese alliance, which had been concluded at London on July 13, 1911, should terminate simultaneously with the conclusion of this treaty.

The Nine-Power Treaty The Nine-Power Treaty also has an important bearing on Japan in that it consolidated the open door policy in connection with China, where Japan has greater interests than any other foreign country, especially in Manchuria. This treaty was invoked against Japan both by the United States and the League of Nations in connection with the Manchurian incident.

In the first article of this treaty, what are known as Root's four principles were incorporated, providing, first, that the sovereignty and independence as well as the territorial and political integrity of China should be respected, second, that most perfect and unrestricted opportunities should be offered China in order that she might be able to establish and maintain a powerful

Digitized by Google

stable government, third, that efforts sould be made to establish and maintain the principle of equal opportunity for commerce and industry to be undertaken by people of all nationalities throughout the territory of China, and fourth, that the signatories should refrain from utilizing conditions in China to seek special rights or interests detrimental to the interests of the subjects or citizens of other friendly nations, or from recognizing actions detrimental to the welfare of such friendly nations.

The Immigration Question In view of the agitation in the United States against Japanese labour, the Tokyo Government had taken every precaution not to aggravate this issue and from 1907, when what is known as the "Gentleman's Agreement" was concluded, Japan continued to restrict emigration to the United States by withholding passports from intending emigrants above a limited number.

However, on August 19, 1913 the State of California promulgated the Alien Land Law (the Webb Bill) prohibiting Japanese and other aliens ineligible for citizenship from owning land, in spite of three protests by Baron Sutemi Chinda, Japanese Ambassador in Washington. In 1919, the Japanese Government took the further precaution of stopping the emigration of so-called "picture brides" to the United States, but nevertheless an ever increasing anti-Japanese sentiment continued to prevail in the United States, and on April 19, 1920, the Federal Immigration Bureau revised the regulations governing the entry of the adopted children of Japanese parents. Moreover, the State of California enacted a second law of exclusion barring the Japanese and other aliens from leasing land, or owning land in the name of corporations or from operating land owned in the name of their American-born children.

The immigration problem assumed its greatest gravity in 1924, when the United States Congress passed a new federal immigration law, which included a provision absolutely prohibiting immigration of Japanese labourers. While this bill was before the Congress, the Japanese Government instructed its ambassador at Washington, Mr. Masanao Hanihara, to call the attention of the United States Government to the importance attached by the Japanese to the proposed legislation. The steps taken by Mr. Hanihara, however, resulted in provoking the American sentiment owing to a phrase "grave consequences" which he used inadvertently in a communication to the Secretary of State, Mr. Hughes.

When the United States President signed the bill on May 24, 1924, the Japanese Government sent in a strong protest but could not improve the situation in any way. The Japanese people took this action on the part of the United States as a serious insult to their national honour.

A resolution calling for ejection of Japanese farmers for the next 10 days from Arizona farmlands was adopted at a convention of about 200 American tenant farmers near Phoenix, the capital of Arizona State in the United States, on August 15, 1934. A movement of forcing Japanese farmers out of their farmlands was subsequently staged several times. These American farmers approached the Governor of the State to recognize their movement, but, when he rejected their petition they resorted to direct action to force Japanese farmers out. The situation then spread to California and in February, 1935, an anti-Japanese exclusion bill was submitted to the Californian State Legislature. The bill provided for an absolute prohibition of Japanese people from engaging in agriculture under any circumstances. The exclusion bill was submitted to an agriculture committee of the Lower House and then was turned over to a judicial committee. Finding that the bill was too exacting and aimed at depriving the Japanese farmers of the right of agriculture, the committee doubted it might conflict the U. S. Constitution and submitted it to the Plenary session of the Californian State Lower House with a desideratum for amendment, but it was shelved at the Upper House. The problem thus was apparently solved, but the exclusion tendency against Japanese was growing keener. Even Japanese who legally entered that country and are engaged in peaceful vocations are not given the treatment accorded the American citizens.

Stimson Idealism The attempted intervention in the Manchurian and Shanghai affairs in 1931 and 1932 by the American Secretary of State, Col. Henry L. Stimson, at one time seemed to menace seriously the relations between Japan and the United States.

Hirota-Hull Messages As soon as Mr. Koki Hirota took office as Foreign Minister he commenced to devote himself to strengthening Japan's friendly relations with her neighbouring countries. As one of the manifestations of such endeavour, he sent through Mr. H. Saito, the new Ambassador, his per-

Digitized by Google

sonal message to Mr. Hull, the Secretary of State of the United States, on February 21, 1934 :

" I firmly believe that, viewed in the light of the broad aspect of the situation and studied from all possible angles, no question exists between our two countries that is fundamentally incapable of amicable solution. I do not doubt that all issues pending between the two nations will be settled in a satisfactory manner, when examined with a good understanding on the part of each of the other's position, discussed with an open mind and in all frankness, and approached with a spirit of co-operation and conciliation."

To this, Secretary Hull replied on March 3 with his personal message in the form of a letter to Mr. Hirota, a summary of which is as follows.

" I believe that there are in fact no questions between our two countries which, if they be viewed in proper perspective in both countries, can with any warrant be regarded as not readily susceptible to adjustment by pacific processes."

American-Japanese Relations in 1936 The diplomatic relations between Japan and the United States have been quite amicable although arguments were exchanged between them regarding the naval question. Apart from the naval question, mention must be made of the fact that the United States raised its tariffs on Japanese cotton cloth. In May, 1936, Congress and industrialist circles in America urged the Japanese Government to control exports of cotton cloth but arrangements in this connection failed to be concluded.

Reference may also be made of the fact that since the autumn of 1936, there have been increasing signs pointing to the possibility of the Japanese salmon-fishing operations off Alaska being made an issue.

The Panay Incident On December 12, 1937, the United States gunboat Panay and three steamers belonging to the Standard Oil Company were sunk by the bombing of the Japanese naval aircraft on the Yangtze River at a point about 26 miles above Nanking in the course of military operation around the Chinese capital.

On December 14, Foreign Minister Koki Hirota sent a note of apology to American Ambassador Joseph C. Grew, in which he informed that the Japanese naval air force, acting upon information that the Chinese troops fleeing from Nanking were going up the river in steamers, took off to pursue them and discovered such vessels at the abovementioned point, and due to poor visibility the aircraft, although they descended to fairly low altitudes, were unable to discern any mark to show that any one of the vessels was an American ship. Consequently the American ships, being taken for Chinese vessels, were bombed and sunk. And in the Note the Foreign Minister stated that the Japanese Government regretted most profoundly that it had caused damages to the American ships and casualties, that the Japanese Government would make indemnifications for all losses and deal appropriately with those responsible for the incident, and that it had already issued strict orders to the authorities on the spot with a view to preventing the recurrence of a similar incident.

On the same day, the Government of the United States, through Ambassador Grew, sent a note to the Foreign Department, which, after describing the circumstances prior to the occurrence of the incident, concluded that the acts of the Japanese forces in the attack were carried out in complete disregard of the rights of the United States, taking American life and destroying American property, both public and private, and stated that " in these circumstances the Government of the United States requests and expects of the Japanese Government a formally recorded expression of regret and an undertaking to make complete and comprehensive indemnifications, and an assurance that definite and specific steps have been taken which will ensure that hereafter American nationals, interests and property in China will not be subjected to attack by Japanese armed forces or unlawful interference by any Japanese authorities whatever."

On December 24, the Foreign Minister sent the second note to Ambassador Grew, saying as to " a recorded expression of regret and indemnifications no word needs to be added to what I have said in my aforementioned Note (of December 14). As regards the guarantee for the future the Japanese Navy issued without delay strict orders to exercise the greatest caution in every area where warships and other vessels of America or any other third Power are present, furthermore, rigid orders have been issued to the military, naval and foreign office authorities to pay greater attention to observance of the instructions that have been repeatedly given against infringement of or unwarranted interference with the rights and interests of the

Digitized by Google

United States and other third Powers. Simultaneously, the Japanese Government is studying carefully every possible means of achieving more effectively the above-stated aims, while it has already taken steps to ascertain in still closer contact with American authorities in China the locations of American interests and nationals, and to improve means of communicating intelligence thereof speedily and effectively to the authorities on the spot." Then the note stated that the Commander of the Flying Force concerned had been immediately removed from his post and recalled, and the staff members of the fleet and the commander of the flying squadron and all others responsible had been duly dealt with according to law.

On December 26, Ambassador Grew sent American note in reply to the Foreign Minister's note of December 24, which stated that the Government of the United States observed with satisfaction the promptness with which the Japanese Government in its note of December 14 admitted responsibility, expressed regret and offered amends, that the American Government regarded the Japanese Government's account, as set forth in the Japanese Government's note of December 24, of action taken by it as responsive to the request made by the American Government in its note of December 14, and that with regard to the facts of the origins, causes and circumstances of the incident the Government of the United States relied on the report of findings of the Court of Inquiry of the United States Navy.

As regards the matter of indemnification, the American Ambassador sent to the Japanese Government an official note dated the 21st March listing (1) amount of property losses $1,945,670.01; (2) death and personal injury indemnification, $268,337.35, totalling $2,214,007.36. The Foreign Office requested of the American Embassy an itemized account of the total claims for indemnification which was sent it on the 9th April. Accordingly, after the completion of the necessary procedures by the Japanese Government, Mr. Seijiro Yoshizawa, Director of the Bureau of American Affairs of the Foreign Office, in the name of the Minister for Foreign Affairs, handed on the 22nd April at 5:00 p.m., a check at his office to the foregoing amount of $2,214,007.36, addressed to the American Secretary of State, Mr. Cordell Hull, to Mr. Eugene Dooman, Counsellor of the American Embassy.

Upon conclusion of this payment, the Panay Affair was amicably and satisfactorily settled.

A Protest On August 26, 1938, the American Government made protests against the unwarranted attack, on August 24, near Macao by Japanese airplanes upon a commercial airplane of the China National Aviation Corporation, and the Japanese Government replied, on August 31, stating that the incident was caused by the said corporation plane which within the Japanese field of operation acted in such a manner as to invite suspicions of its being a Chinese military craft, and that the company to which the aircraft belonged being a Chinese juridical person, the incident was not one which involved Japan directly with any third Power.

Antiquated Nine-Power Treaty On October 6, 1938, the American Government sent in a note of protest against the alleged discriminate treatment by the Japanese authorities of American citizens in China, violating the rights and interests of the United States. The Japanese Government answered the note, stating that there was no intention of interfering with American rights and interests in China and hinting at, for the first time, the inapplicability of the clauses of the Nine-Power Treaty to the new order of things in China, on November 18. The conclusions of the Japanese Note follow:

"As has been explained above, the Japanese Government, with every intention of fully respecting American rights and interests in China, have been doing all that could possibly be done in that behalf. However, since there are in progress at present in China military operations on a scale unprecedented in our history, it may well be recognized by the Government of the United States that it is unavoidable that these military operations should occasionally present obstacles to giving full effect to our intention of respecting the rights and interests of American citizens. Japan at present is devoting her energy to the establishment of a new order based on genuine international justice throughout East Asia, the attainment of which end is not only an indespensable condition of the very existence of Japan, but also constitutes the very foundation of the enduring peace and stability of East Asia. It is the firm conviction of the Japanese Government that in the fact of the new situation, fast developing in East Asia,

Digitized by Google

any attempt to apply to the conditions of to-day and to-morrow inapplicable ideas and principles of the past would neither contribute toward the establishment of a real peace in East Asia nor solve the immediate issues. However, as long as these points are understood, Japan has not the slightest inclination to oppose the participation of the United States and other Powers in the great work of reconstructing East Asia along all lines of industry and trade; and I believe that the new régimes now being formed in China are prepared to welcome such foreign participation.

The Late Ambassador Saito and the President The former Ambassador Hiroshi Saito died in Washington on February 26, 1939. And in appreciation of his noble services for the maintenance of friendly relations between the United States and Japan, President Roosevelt extended courtesy and kindness toward the bereaved family and Japan by issuing an order to convey the remains of the deceased in honour to Japan on board the United States cruiser "Astoria". The cruiser, commanded by Captain R. K. Turner, with the remains of the late Ambassador, sailed from Annapolis on March 18 and arrived at Yokohama on April 17.

This friendly and thoughtful action on the part of the American President profoundly moved the Government and people of Japan who duely expressed their thankfulness both in words and action on the arrival of the "Astoria".

Relation with Germany

Anti-Comintern Agreement The Governments of Japan and Germany having decided on the fundamental policy of creating a common front against Communism, detailed negotiations were commenced during the latter part of July 1936, at Berlin between the Japanese Ambassador to Germany and the German authorities. The negotiations resulted in an agreement which was signed provisionally on October 23. After the approval of the Japanese Privy Council had been secured, the anti-Comintern pact was formally signed on November 25 between Viscount Kintomo Mushakoji, the Japanese Ambassador in Berlin, and Colonel von Ribbentrop, the German representative. The pact went into effect simultaneously with the signing.

The conclusion of this agreement with Germany attracted a great deal of public attention all over the world as the most important diplomatic step taken by Japan since her withdrawl from the League of Nations in 1933. On November 25, 1936, the Japanese Foreign Office issued a statement announcing the signing of the agreement and explaining its significance as follows:

1. Ever since its establishment, the Communist International, or the so-called Comintern, with its headquarters at Moscow, has been engaged in all sorts of activities, greatly menacing the peace of the world, for the purpose of destroying the national and social structures in every country in pursuance of the fundamental policy of world revolution. At its Seventh Congress, held in the summer of last year, the Comintern decided on a policy of organizing a united front with the Second International to oppose Fascism and imperialism and at the same time made it plain that the future objectives of Comintern activities were to be Japan, Germany and Poland. It further resolved to support the Chinese Communist armies in order to fight Japan. The actual operations subsequently carried on by the Comintern have become extremely ingenious, rendering them all the more dangerous.

As to the extent to which the Comintern interferes with the internal affairs of all countries and exerts a baneful influence on the well-being of nations and the peace of the world, it is only necessary to look at the present disturbances in Spain to realize its magnitude. At least those countries that lodged protests with the Government of the Soviet Union at the time of the Comintern congress certainly have full cognizance of the harmfulness of Comintern activities.

2. The Communist invasion has hitherto been more marked in the Orient, especially in China, than elsewhere. Outer Mongolia and Sinkiang have already suffered from its calamitous effects, and China proper is now being subjected to the depredations of the Communist armies. As a matter of fact, the activities of the Comintern in China have increased notably in vigor since its Seventh Congress.

In Manchoukuo also the Comintern has been surreptitiously endeavouring through the Manchurian district committee of the Chinese Communist Party to organize cells, to win over and instigate bandits and to direct the raids by partisan troops all over the country.

In Japan, the extreme leftist movement temporarily showed signs of decline after the Manchurian incident, but since the Seventh Congress of the Comintern it has again become energetic. It has crept into the channels of lawful agitation in conformity with the resolution of that congress and has

Digitized by Google

launched a unified front movement that is intended to be the basis for revival of the Communist movement.

3. The Japanese Government, which, in order to safeguard Japan's immutable national policy and insure national security and to maintain everlasting peace in East Asia, has pursued a clear-cut and consistent policy toward the Comintern, finds it necessary to take more rigorous measures of self-defence against the increased menace set forth above.

The organization and activities of the Comintern being of an international character, any programme of counteraction should necessarily be based on international co-operation. Germany, ever since the establishment of the present régime in 1933, has put into execution drastic anti-Communist policies. Last year at the Seventh Congress of the Comintern, Germany and Japan were selected as the special objectives of Comintern operations. Thus Japan and Germany are placed in similar circumstances vis-à-vis the Comintern. Consequently the Japanese Government, as the first step in its defensive undertaking, conducted negotiations with Germany and concluded an agreement on November 25 to take effect immediately.

4. This agreement, the fundamental object of which is common defense against the destructive operations of the Comintern, contains provisions for the exchange of information regarding Comintern activities, for consultation on, and execution of joint invitations to third Powers. There is, besides, a supplementary protocol stipulating in concrete terms the manner in which the agreement is to be executed.

5. The Japanese Government is desirous of co-operating with as many Powers as possible for the purpose of perfecting its defensive measures against the Comintern menace, but for that purpose alone. It should be pointed out that in connection with, or behind, this agreement there exists no other agreement whatsoever, that the Japanese Government has no intention to form, or join in, any special international bloc for any other purpose and finally that the present agreement is not directed against the Soviet Union or any other specific country. (The text of the agreement is given in Appendix.)

Cultural Cooperation On November 25, 1938, the two countries entered into an agreement for furthering their traditional cultural relations. The Foreign Office Spokesman made the following statement on the same:

It is a matter for sincere congratulation that the cultural agreement between Japan and Germany, for whose conclusion negotiations have been going on for some time between the representatives of the two countries in Tokyo, has been signed and gone into effect today; the agreement will not only conduce to drawing still closer the cultural relations between the two nations, but be instrumental in enabling them to deepen their knowledge and understanding of each other.

Japan has recently severed all her relations with the League of Nations. This, however, does not mean that Japan has severed her cultural relations with foreign countries or suspended her co-operation with them in the cultural field, but on the contrary she is as ready as ever to co-operate in cultural undertakings with those foreign countries in friendly relationship with her, whether they are member states of the League or not.

The cultural agreement, signed between Japan and Germany today, is a manifestation of the earnest desire of the Japanese Government for strengthening cultural ties with foreign countries through agreements to be concluded separately on a basis of reciprocity. It is the first of the kind to be put into operation, but we hope that it will be followed by similar pacts to be concluded with as many foreign Powers as possible. For instance, a cultural agreement was already signed between Japan and Hungary on November 15 and expected to go into effect in the near future, while preparations are under way for concluding a similar agreement with Italy. It is the policy of the Japanese Government to accelerate conclusion of cultural agreements with those foreign Powers which are desirous of so doing.

The key-note of those agreements which are anticipated to be concluded with foreign Powers lies in an exchange and intermixture of Japanese culture (whose essence will be fostered and developed) and the essence of characteristic cultures of various foreign countries. The present cultural agreement between Japan and Germany provides for a general policy in cultural co-operation between the two countries under the above-mentioned guiding principle.

Various fields of activities, stipulated by Article II of the present agreement, are only given as examples. Cultural pacts between foreign countries usually have detailed stipulations, but the present agreement between Japan and Ger-

Digitized by Google

many is rather different in stipulating general provisions for cultural co-operation and leaving room for giving full play to them as occasion demands, while matters of detail shall be discussed and decided on between the competent authorities of the High Contracting Parties in case of necessity. (The text of the agreement in given in Appendix.)

Relations with Italy

An Understanding The friendly relations between Japan and Italy were greatly improved by the avowed intention of the Italian Government to create a consulate-general in Manchoukuo and the decision of the Japanese Government to close its legation in Ethiopia following the annexation of that territory by Italy. Taking advantage of the situation, negotiations were opened between the two Governments concerned during the early part of November, 1936, following the conclusion of the German-Japanese anti-Comintern pact, for the conclusion of an Italo-Japanese agreement.

The negotiations were aimed at the virtual recognition of Manchoukuo by the Italian Government, the creation of a Japanese consulate in Ethiopia and the maintenance and promotion of the economic interests of Japan in that territory. Announcements were issued on December 23, 1936, both in Tokyo and Rome, concerning the Italo-Japanese agreement which took the form of an understanding.

Anti-Comintern Agreement Italy entered the Agreement on November 6, 1937. The account is given in the "Tripartite Agreement against the Comintern Activity", contained in this Chapter.

Cultural Cooperation The relation of Japan and Italy was further strengthened with the conclusion of an agreement on cultural cooperation on March 23, 1939. The English translation of the text of the agreement is inserted in Appendix at the end of this volume; the statement of the Foreign Office Spokesman on the occasion follows:

It is a matter for hearty congratulation that the cultural agreement between Japan and Italy, for the conclusion of which negotiations have been going on in Tokyo between the representatives of both countries since the end of last year, has today been formally signed and gone into effect.

At the time of the conclusion of the Japanese-German Cultural Agreement, the Japanese Government declared that they would co-operate in cultural undertakings with those foreign countries which are in friendly relationship with Japan through a bilateral agreement based on the principle of reciprocity, and not through the League of Nations. It is quite natural that, following the conclusion of such a cultural agreement with Germany, Japan should have entered into a similar agreement with Italy, with which our country has long enjoyed intimate cultural relations in the fields of arts and sciences. The fact that the cultural intercourse between the Japanese and Italian peoples will by virtue of the present agreement grow further in intimacy and that the two nations will further deepen their knowledge and understanding of each other will in no small measure contribute toward the promotion of understanding and amicable relationship between the two countries which has grown exceptionally cordial under the anti-Comintern agreement.

Of late, admiration in various countries abroad for Japanese culture has been increasing. At the same time the interest of Japan and Italy for the study of each other's culture is particularly keen, and the undertakings for their cultural exchange are growing too numerous to mention. In view of Japan's important cultural mission of contributing toward the cultural progress of the world through the creation of a new unified culture in East Asia we find the conclusion of the present agreement especially significant, providing as it does a firm basis for cultural co-operation between the two countries and the consolidation of their spiritual union. It gives an opportunity to demonstrate fully our culture, while absorbing at the same time the best in Italian culture.

The present agreement is similar to the Japanese-German cultural agreement in that, while providing a basic policy for the cultural co-operation between the two countries, it leaves concrete matters to be determined by consultation between the competent authorities of both countries as the occasion demands and to be put into practice freely and appropriately.

Italy Helping Japan From the beginning of the China Affair in 1937, Italy, understanding Japan's true motives, had collaborated with Japan along all lines. At the Brussels Conference of the Signatory Powers to the Nine Power Treaty, the Italian Government supported Japan most consistently and energetically. A supplementary agreement to the Italo-Japanese Treaty of Commerce relating to the Italian colonies was signed in 1937.

The Tripartite Agreement against the Comintern Activity

The German-Japanese Agreement against the Communist International which had been concluded on November 25, 1936, was reinforced by the participation therein of Italy. The tripartite protocol was made public on November 6, 1937, when the Sino-Japanese conflict was in full swing, and the Nine-Power Conference was in session at Brussels. With the signing of the tripartite protocol the solid front that had been built against the Comintern activities both in Europe and Asia was further strengthened, making the communist bulwarks morally and materially weaker. Some indirect results of the tripartite agreement were the Japanese recognition of the Franco Government in Spain on December 1, 1937, mutual recognition between the Manchoukuo Government and the Franco Government on December 2, and the withdrawal of Italy from the League of Nations on December 11, thereby Italy concluding the dispute with the League regarding her claim on Abyssinia.

The gist of the statement of the Japanese Foreign Office concerning the conclusion of the tripartite protocol published on November 6, 1937, and the English translation of the main clauses of the protocol are given below : (For the original text of the protocol see Appendix.)

At 11.00 o'clock a.m. (7.00 p.m. Tokyo time) today, November 6, a Protocol concerning the participation of Italy in the Japanese-German Agreement against the Communist International has been signed in Rome between the delegates of Japan, Germany and Italy, and has immediately come into effect.

Article 2 of the Agreement against the Communist International, which was concluded in Berlin between Japan and Germany on the 25th November last year, provides that the two countries should jointly invite participation of third Powers in the agreement. It is in accordance with this provision that the participation of Italy has been brought about, the country being as firmly determined as Japan and Germany in opposition against the destructive operations of the Communist International.

Now with the first anniversary of the conclusion of the Japanese-German anti-Comintern agreement close at hand, the significance and efficacy of the agreement are being more and more deeply appreciated everywhere. Today when we have before our own eyes concrete evidence showing that, in the West, the internecine war of more than a year and a half in Spain, and, in the East, the surreptitious activities of the Communist Party and the Anti-Japanese People's Front which are disturbing the stability of East Asia, are both due to nothing other than the machinations of the Communist International, it is really encouraging that the anti-Comintern front formed by Japan and Germany has been further strengthened by the participation of Italy, which had been of late making a spectacular progress under the leadership of Premier Mussolini. This indeed is a matter for sincere congratulation in the interest of peace and civilization of the world.

Protocol between Japan, Germany and Italy The Imperial Government of Japan, the Government of Italy and the Government of Germany, considering that the Communist International is constantly endangering the civilized world in the Orient and the Occident, and disturbing and destroying its peace and order, convinced that only a close collaboration between all the Powers interested in the maintenance of peace and order can check and eliminate that danger, and considering that Italy, a State which, since the establishment of the Fascist régime, has combatted that danger with inflexible determination has decided to range herself against that common enemy along with Japan and Germany, States which on their part are animated by the same spirit of defence against the Communist International, have, in conformity with Article 2 of the Agreement against the Communist International concluded at Berlin on November 25, 1936 between Japan and Germany, agreed as follows :

Article 1

Italy participates in the Agreement against the Communist International and subscribes to the Supplementary Protocol concluded on November, 25, 1936, between Japan and Germany, texts of which are attached to the present Protocol as an annex thereto.

Article 2

The three Powers signatory to the present protocol agree that Italy is to be considered as an original signatory of the agreement and the supplementary protocol mentioned in the preceding Article, the signature of the present protocol being equivalent to signature of the original texts of the agreement and the supplementary protocol.

Digitized by Google

Article 3

The present protocol shall form an integral part of the agreement and the supplementary protocol above mentioned.

Manchoukuo and Hungary's Entrance On February 24, 1939, Manchoukuo and Hungary signed at Hsinking and Budapest respectively the Protocols on their participation in the Agreement for Safeguarding against the Communist International with Japan, Germany and Italy.

Manchoukuo had been endeavouring in cooperation with Japan to eradicate Communism. Her international position had been greatly strengthened through formal recognition extended by Hungary, following a similar step taken by Salvador, Germany, Italy and Spain, and now with her participation in the Agreement it was further strengthened so that she may act with a greater conviction in her own power as an important factor in the formation of the new East Asiatic Order.

A faction of communist radicals under Bela Kuhn usurped the power of government in Hungary, in 1919, by taking advantage of the confusion resulting from the World War, and attempted to form a socialistic league of nations by entering into a military alliance with the Soviet Union. But Hungary succeeded in suppressing the communist revolution, and has since continued to exert her utmost effort to combat the Comintern. When Hungary declared that she would join the Agreement, the Soviet Union recalled her Minister at Budapest, demanding at the same time the closure of the Hungarian legation at Moscow, in an attempt to check Hungary. Hungary, nevertheless joined the Agreement fully demonstrating her strong determination.

Spain's Entrance Spain, reborn under the leadership of General Francisco Franco, formally participated in the Anti-Comintern Agreement on March 27. The Comintern, which failed utterly in its efforts to bolshevize Germany and Italy in previous years, laid the front line in Spain for the bolshevization of all of Europe. As a result, Spain was divided into two opposing factions, and the faction led by General Franco, surmounting numerous difficulties, finally occupied Barcelona early in 1939 and succeeded in pacifying the Catalonian sector. The Communist régime immediately collapsed, and Madrid finally capitulated on March 28th. The Spanish civil war which began two and a half years ago was thus brought to a close, culminating in a decisive victory for General Franco. The Powers in the Anti-Comintern front have early extended recognition to General Franco's Government and have been giving full support to that Government's work of subduing Communism.

Relations with France

Request of Japan In October, 1937, the French Government decided on their own volition to prohibit the transportation of arms and munitions into China through French Indo-China. The Japanese Government appreciated this friendly attitude and relied upon the sincerity of the French Government for the actual carrying out of that decision.

However, as there was much to be regretted in the manner of executing the policy, the Japanese Government repeatedly called the attention of the French Government. During 1938 the Japanese Government demanded the French Government on two occasions to reconsider their attitude.

Each time the French Government promised the enforcement of the prohibition. But according to reliable information there continued to prevail a situation which by no means agreed with the replies of the Franch Government. As the result of the capture of Canton which intercepted the connection of the Chiang Kai-shek régime with Hongkong, the most important of the routes left for the transportation of arms supply to that régime was one through French Indo-China, and China was reported to be now active there.

In view of the above circumstances the Japanese Government instructed Ambassador Sugimura at Paris to file a protest with the French Government requesting that Government to take appropriate steps immediately to prohibit the transportation of arms and munitions into China through French Indo-China, and stating at the same time that, in case the French Government failed to take such measures, Japan might be compelled in self-defence to take such measures as she deemed necessary.

Foreign Minister Prince Konoé requested the French Ambassador at Tokyo, Mr. Arsène-Henry, on October 28, 1938, to call at the Foreign Office and conveyed to the latter the same views of the Japanese Government mentioned above.

Occupation of Hainan Island On February 13, 1939, the French Ambassador Mr. Charles Arsène-Henry called on the Foreign Minister, Mr. Hachiro Arita, at the Foreign Office to seek the Japanese

Digitized by Google

Government's explanation regarding the object, duration and nature of the Japanese occupation of Hainan Island. Foreign Minister Arita assured the French Ambassador that Japan's occupation of Hainan Island had a military object to strengthen Japanese suspension of traffic against Chinese vessels off South China and thereby to accelerate the collapse of the Chiang Kai-shek régime, while in its nature and duration Japan's occupation of the said island did not exceed military necessity. Foreign Minister Arita made it clear that Japan had no territorial designs on the island. The French Ambassador appreciated Foreign Minister Arita's explanation.

The Spratley Islands In March 31, 1939, the Japanese Government published a statement concerning the administrative jurisdiction over the Spratley Islands in the South China Sea as follows:

Shinnan Gunto (or the Spratley Islands) are a group of small reefs lying in the South China Sea, off the coast of French Indo-China. These reefs had long been known as ownerless. However, in 1917 Japanese began, before the nationals of any other country, to embark upon the economic development of the reefs, which has continued ever since, by investing a considerable amount of capital and erecting various permanent establishments. The Japanese Government, officially recognizing the acivities of these nationals, have on several occasions since sent warships to the reefs and been giving them various aids as occasion demanded. But the absence of administrative jurisdiction over the reefs has caused not only inconveniences with regard to the protection and regulation of the lives, property and enterprises of the Japanese nationals there, but has been liable to give rise to unnecessary disputes with France. Accordingly, the Japanese Government, in order to eliminate such inconveniences and disadvantages, have decided to place the reefs under the jurisdiction of the Government-General of Taiwan, and having published the fact under date of March 30, 1939, the Vice-Minister for Foreign Affairs, Mr. Renzo Sawada, notified the French Ambassador in Tokyo, Mr. Charles Arsène-Henry, to this effect on March 31.

France Protests The French Ambassador, Mr. Arsène-Henry, called on Foreign Vice-Minister Sawada at the Foreign Office at noon on April 5 and, under instructions from his home Government, handed to him a note protesting against the Japanese Government's previous communication in connection with its decision to place the Shinnan Gunto under the jurisdiction of the Formosan Government-General.

The Foreign Vice-Minister told the French Ambassador that there is no room for consideration regarding the issue, which was decided on the basis of established policy, and that the Japanese Government would receive the note only as a matter of reference.

Japan-Siamese Relation

The Government of Siam notified Japan on November 5, 1936, of its intention to abrogate the Japanese-Siamese commercial treaty with a view to realization of complete equality with other countries and to the restoration of self-government, both legally and financially. In 1937 a new Treaty of Commerce was signed between Japan and Siam.

Japanese-Burmese Commercial Treaty As Burma was scheduled to be separated from India on April 1, 1937, negotiations were opened between representatives of Japan and Burma at New Delhi in December, 1936, for conclusion of a Japanese-Burmese commercial treaty. As a result, a protocol was signed provisionally between Mr. Yonezawa, Japanese Consul General, and the Financial Secretary of the Government of India on March 1, 1937, and the formal signing took place later in London between representatives of Japan and Great Britain.

Japan and Transvaal

The authorities of the Transvaal in South Africa having prohibited the residence of coloured races in the gold-producing district including Johannesburg, the capital of the Transvaal, and having refused to permit coloured races to engage in wholesale business, which is closely related to the export and import trade, Mr. Ohta, Japanese Consul at Cape Town, endeavoured to have the unjustified regulation revised and the Japanese claims were accepted by the authorities in their entirety on June 15, 1936, the Parliament of South Africa passing a bill dividing the said regulations, and settling the question.

Japan and Turkey

The Government of Turkey notified the Government of Japan on October 27, 1936, of its intention to abrogate the provisional trade convension between Japan and Turkey which was enforced on January 1, 1935, and the arrangement made between the two countries concerning the enforcement. At the same time, the Turkish Government expressed its readiness to conclude a new

Digitized by Google

treaty. The Turkish note addressed to treaty, and a new treaty was concluded in 1937.

Relations with South and Central America

Anti-Japanese questions have often been heard of in regard to Brazil in South America but none of the questions has ever been brought up between the diplomatic organs of the two countries. But mention must be made of the fact that Brazilian economic mission headed by Mr. Salgado Filho, former Minister of Labour and member of the Lower House at the time, visited Japan in July, 1936, and greatly strengthened the tie of friendship between the nations.

In regard to Paraguay in Central America, it may be noted that about 35 families of Japanese emigrants settled in that country during 1936. Later, a French financial syndicate thought the co-operation of Japan in the industrial development of Paraguay would be of great benefit to that country and negotiations were conducted in this connection and on December 5, 1936, the President of Paraguay issued a decree authorizing the exportation of products of the country to Japan to the amount of 250,000 pesoes annually through the French financial syndicate and the entry into Paraguay of a total of 1,000 families of Japanese emigrants within 5 years or no more than 200 families annually.

Japan and Manchoukuo

The Manchurian Incident What is known as the Manchurian Incident broke out with the blasting of a section of the South Manchurian Railway near Liutiaokou by Chinese regular troops on September 18, 1931. It has brought about the foundation of a new nation in Manchuria and the withdrawal of Japan from the League of Nations. The incident though called in the singular was not really a single incident, but a series of incidents which followed one after another after the unexpected outbreak, the inevitable sequel to long-continued and growing anti-Japanese activities on the part of the old Mukden militarists.

The hostilities which occurred in Shanghai in January, 1932, as well as the threatening situation in Tientsin some time earlier were only two of the manifold ramifications of the Manchurian Incident. The state of affairs known as the Manchurian Incident continued until the truce concluded on May 31, 1933, at Tangku between the Japanese and Chinese forces, which to all intents and purposes wound up the Jehol expedition carried out by the combined Japanese and Manchoukuo armies to pacify the province and protect the provincial people from local banditry and invading troops from the south across the Great Wall.[1]

Founding of Manchoukuo The Manchurian Incident having resulted in the over-throw of the old régime of Chang Hsueh-liang, various groups came to declare independence in different districts of Manchuria.

The chief principles of the projected new government called for the suppression of the military cliques, co-operation with the rest of the world in line with the principle of the open door and equal opportunity for all, elimination of anti-foreignism, and promotion of the welfare of the people in place of the oppression and grinding taxation from which they had hitherto suffered.

Thus, on March 1, 1932, a manifesto was promulgated announcing that Manchoukuo was founded in response to the unanimous aspirations of the 30,000,000 people of Manchuria and Mongolia. On March 7, Mr. Henry Pu-yi, who had once reigned over the entire territory of China as the 12th Emperor of the Ching dynasty, consented to become the Chief Executive of Manchoukuo. This was followed by the installation in office of Mr. Henry Pu-yi and the ceremony celebrating the founding of Manchoukuo at Changchun on March 9. (For particulars see Chapter on Manchoukuo.)

The Japanese Envoy On August 8, 1932, General Nobuyoshi Muto was appointed commander of the Kwantung army with concurrent offices as Ambassador Extraordinary and Minister Plenipotentiary to Manchoukuo and Governor of the Kwantung Leased Territory.

Recognition of Manchoukuo The Japanese Government extended de jure recognition to Manchoukuo on September 15, 1932, when the protocol completing this procedure was signed at the Chief Executive's offices in Hsinking between General Muto representing Japan and Premier Cheng Hsiao-hsu representing Manchoukuo.

The official English translation of this protocol follows :

Whereas Japan has recognized the fact that Manchoukuo, in accordance with the free will of its inhabitants, has organized and established itself as an

1 For particulars of the incident see the Japan Year Book, 1933, Chapter VII.

Digitized by Google

independent State; and

Whereas Manchoukuo has declared its intention of abiding by all international engagements entered into by China in so far as they are applicable to Manchoukuo;

Now the Governments of Japan and Manchoukuo have, for the purpose of establishing a perpetual relationship of good neighbourhood between Japan and Manchoukuo, each respecting the territorial rights of the other, and also in order to secure the peace of the Far East, agreed as follows:

1. Manchoukuo shall confirm and respect, in so far as no agreement to the contrary shall be made between Japan and Manchoukuo in the future, all rights and interests possessed by Japan or her subjects within the territory of Manchoukuo by virtue of Sino-Japanese treaties, agreements or other arrangements or of Sino-Japanese contracts, private as well as public;

2. Japan and Manchoukuo, recognizing that any threat to the territory or to the peace and order of either of the High Contracting Parties constitutes at the same time a threat to the safety and existence of the other, agree to co-operate in the maintenance of their national security; it being understood that such Japanese forces as may be necessary for this purpose shall be stationed in Manchoukuo.

The present Protocol shall come into effect from the date of its signing.

The present Protocol has been drawn up in Japanese and Chinese, two identical copies being made in each language. Should any difference arise in regard to interpretation between the Japanese and the Chinese texts, the Japanese text shall prevail.

Partial Abolition of Extraterritoriality The basic treaty between Japan and Manchoukuo concerning the partial abolition of Japanese extraterritorial privileges in Manchoukuo, for which preparations had been underway for sometime, having been ratified by the Privy Councils of the two nations, was signed at Hsinking on June 10, 1936, by representatives of the two Governments concerned. The treaty was announced on June 12 and enforced on July 1.

The second treaty for the same purpose was concluded in November, 1937, and the operation of these treaties has proved satisfactory for both countries.

Relations with the League of Nations

Japan's connection with the League of Nations began with the inception of the international organization in April, 1919, when the Covenant was officially adopted at Paris, and came to a virtual end on March 27, 1933, when Japan gave notice of her withdrawal from membership on grounds of dissatisfaction with the dealings of the Geneva body with the Sino-Japanese dispute, particularly with the report adopted by the League Assembly on February 24 and the recommendations for the settlement of the problem as contained therein. The withdrawal became completely effective on March 26, 1935, in accordance with the provisions of the League Covenant.

Contribution to League's Work During the period of her participation in the activities of the League Japan made a material contribution to its work. In the Secretariat of the League, too, Japanese co-operation was by no means negligible, Dr. Inazo Nitobé and Dr. Yotaro Sugimura having served in the capacity of Assistant Secretary-General in succession until early March, 1933, shortly before Japan's virtual withdrawal. What follows is a cursory review of Japan's relations with the League.

From the inauguration of the League until 1933, Japan served as one of the five permanent members of the Council. Moreover, she contributed a considerable sum to the revenue of the body, her annual subscriptions between 1926-1932 having amounted to 16.5 per cent of the total expenditure.

The problem of general disarmament was taken up by the disarmament preparatory commission of the League in 1925. After meeting in session several times the commission submitted its draft formula for general disarmament to the Council in January, 1931 and the General Disarmament Conference was convened to meet at Geneva to discuss limitation of the military, naval and aerial armaments of all countries late in 1932, when Japan's delegates submitted their proposal regarding naval disarmament as outlined elsewhere.

Relations with the Permanent Court As regards the Permanent Court of International Justice at the Hague, Japan has rendered due assistance to the League of Nations' efforts for arbitration at this court by sending jurists to sit on its benches, but she has not yet participated in the general provisions for peaceable disposal of international disputes, which were adopted at the Assembly in 1928. Nor has she decided yet on the adherence to the "optional clause" of the Hague court, which has been signed or accepted by Great Britain, France, Italy and about forty other countries, thereby expressing their will-

Digitized by Google

ingness to accept compulsory arbitration in international disputes.

Relations with the International Labour Office Among the various conventions drafted by the International Labour Office of the League of Nations, Japan has ratified the following on the dates given in parenthesis :

(1) Convention concerning workmen's compensation for occupational diseases (November 2, 1922).

(2) Convention fixing the minimum age for admission of children to industrial employment (June 3, 1926).

(3) Convention fixing the minimum age for admission of children to employment at sea (June 4, 1924).

(4) Convention for establishing facilities for finding employment for seamen (November 23, 1922).

(5) Convention concerning the age for admission of children to employment in agriculture (December 9, 1923).

(6) Convention concerning the compulsory medical examination of children and young persons employed at sea (June 7, 1924).

(7) Convention concerning workmen's compensation for occupational diseases (October 8, 1928). Note : this convention does not apply to such overseas dependencies of Japan as Chosen, Taiwan, Karafuto, the Kwantung Leased Territory and the mandated islands in the Southern Pacific.

(8) Convention concerning equality of treatment for national and foreign workers as regards workmen's compensation for accidents (October 8, 1928). Note : this convention also does not apply to the overseas dependencies of Japan mentioned above.

(9) Convention concerning the simplification of the inspection of emigrants on board ship (October 8, 1928.) Note : this also does not apply to the above mentioned territories.

The League commission on international communication and transit has drafted several conventions, of which Japan ratified the one concerning freedom of communication in 1922, and two others concerning seaports and railway systems in 1926.

Sino-Japanese Issue and the League Following the outbreak of the Manchurian Incident, the Council of the League of Nations held an urgent session in compliance with a request of Dr. Alfred Sze, the Chinese representative, on September 22, 1931.

Following the publication of the statement of the Tokyo Government, the intentions of Japan gradually came to be understood by the Powers, and the League Council adjourned on September 30 after adopting a resolution.

The situation, however, threatened to grow worse on October 8, the air raid on Chinchow was reported, and on the following day Japan lodged a protest against the anti-Japanese movement and sent a naval force to South China.

For three days from October 14, the Council discussed the question of the proposal to invite an observer of the United States to attend the Council meeting. The Japanese representative objected to this proposal from a juridical viewpoint, but at a private session held on the 15th, the Council passed this proposal as a question of "procedure" by a majority vote with Japan alone dissenting.

Accordingly the United States was represented by Mr. Prentiss Gilbert, the American consul-general at Berne, as an observer at the Council meeting from October 16.

At its private session on October 17, which is known as the 13-power conference because of the absence of the Japanese and Chinese representatives, the Council, with the attendance of the American observer, resolved that the 13 Powers take steps to call the attention of Japan and China to the Kellogg-Briand anti-war pact with regard to the Manchurian situation.

Consequently the Powers interested sent notes to Japan and China to that end, and the Japanese Government replied to these notes on the basis of a decision reached at an urgent meeting of the Cabinet held on October 22.

Briand's Proposal In the course of this conference M. Briand proposed a tentative plan to Mr. Yoshizawa, suggesting that Japan recognize the sovereignty of China in Manchuria, that China suppress her anti-Japanese agitation, boycott and anti-Japanese education, that China guarantee the safety of the lives and property of the Japanese nationals in China, that China recognize the right of Japanese nationals to reside, travel and engage in business in Manchuria, and that China confirm before the League of Nations the rights vested by all the existing treaties including what is known as the "Twenty-one Demands."

On October 22 the Council proposed to make Japan complete the withdrawal of her troops by November 15 with neutral observers seeing to it that perfect peace and order would be maintained after the Japanese evacuation, and to make Japan and China appoint their respective representatives to take charge of the evacuation of the occupied area, it also being suggested that

Digitized by Google

Japan and China start direct negotiations immediately after the completion of the evacuation.

The Counter Proposal Against this, the Japanese representative, Mr. Yoshizawa, submitted a counter-proposal to the Council on the 23rd to the effect that the Japanese Government should withdraw those of its troops still remaining in a few localities outside the railway zone as the then-prevailing atmosphere of tension cleared and the situation improved, by the achievement of a previous understanding between the Chinese and Japanese Governments as regards the fundamental principles governing normal relations, that the Japanese and Chinese Governments should confer together at once with a view to arriving at the understanding mentioned above, and that the Japanese and Chinese Governments should appoint representatives to arrange the details of execution of the evacuation and of taking over the districts evacuated.

The Japanese counter-proposal was defeated by a vote of 13 to 1, and the Council's resolution also failed to pass by a unanimous vote, the vote being 13 to 1 in favour of the Council proposal, the Japanese representative dissenting.

The Five Principles Following this, the Japanese Government published a statement on October 26, regarding the "fundamental principles." In this statement Japan made it clear that these so-called "basic principles" related to:

1. Mutual repudiation of aggressive policy and conduct.
2. Respect for China's territorial integrity.
3. Complete suppression of all organized movements interfering with freedom of trade and stirring up international hatred.
4. Effective protection throughout Manchuria of all peaceful pursuits undertaken by Japanese subjects.
5. Respect for the treaty rights of Japan in Manchuria.

The League of Nations' Council held its third session to discuss the Sino-Japanese issue on November 16, 1932.

The Resolution of December 10 Before adjourning, the Council adopted a resolution by a unanimous vote on December 10. This resolution in effect provided that the Japanese Government should withdraw its troops within the railway zone in proportion as the safety of the lives and the protection of the property of Japanese subjects were effectively secured and that the two parties should undertake to adopt all measures necessary to avoid any further aggravation of the situation and to refrain from any initiative which might lead to further fighting and loss of life.

Regarding this resolution, the Japanese representative declared that his Government accepted the resolution on the understanding that it would not prevent the Japanese military authorities from taking action in defence of lives and property of Japanese nationals against bandits and other lawless elements rampant in various parts of Manchuria.

Opinion Adverse Just after the League Council met in its 66th regular session on January 25, 1932, troubles broke out in Shanghai and Mr. W. W. Yen, the Chinese representative, appealed to the Council on January 29 to invoke Article 15 of the League Covenant in regard to the affair.

Thus, at the Council meeting on January 30, it was decided that only the first paragraph of Article 15 of the Covenant would be invoked, in regard to the Shanghai incident alone. Accordingly, representatives of the neutral members of the Council organized an international committee at Shanghai to gather information on the spot and submit it to the Council.

This committee sent in four reports successively, first under date of February 6, second under date of February 12, third under date of February 20 and fourth under date of March 6. Of these, the first report was very favourable to Japan, but the second report proved decidedly unfavourable to Japan, it declaring that the Japanese and Chinese troops had been in a state of open hostilities since February 3.

Consequently, the Council caused the representatives of the 12 members of the Council other than Japan and China to address an appeal to Japan on February 16, regretting that it appeared that Japan could no longer trust to the peaceful settlement to be provided by the League of Nations.

Japan's Refutation Thereupon, in a statement published on February 23, the Japanese Government refuted this appeal in detail asserting that, although China had been treated in the past, by common consent, as if the expression connoted an organized people, such fictions could not last forever, nor could they be tolerated when they became grave sources of actual danger. Thus the Japanese Government declared that the time had inevitably come when realities, rather than fictions, had to be reckoned with.

Shanghai Armistice On February 27,

Digitized by Google

1932, the Japanese delegation at Geneva unofficially notified the representatives of the 12 member Powers of the Council that Japan was willing to participate in a roundtable conference if the Powers would sponsor such a parley at Shanghai.

The armistice conference was officially opened at Shanghai on March 24, but the progress of the parley was delayed owing to a divergency of opinion between the Japanese and Chinese delegates regarding the time to be fixed for the final withdrawal of the Japanese troops.

During this period of deadlock China made a sudden appeal to the League of Nations on April 11, reporting a rupture of the conference.

On receipt of this appeal, the Committee of 19, organized by the League Assembly on March 11 to continue in charge of the entire Sino-Japanese issue, immediately accepted this representation and opened a session on April 16 to discuss the situation.

At its session on April 19, the Committee of 19 drafted a resolution for the Assembly with the object of breaking through the reported deadlock between Japan and China.

This proposal was met by strong opposition from the Japanese Government as well as the military and public opinion of Japan, and another crisis arose between Japan and the League of Nations. But the situation was improved and the League Assembly adopted the Lampson plan by a unanimous vote on April 30. The crisis having thus passed, the armistice conference was resumed at Shanghai on April 28, and despite the occurrence of the tragic bombing outrage on the occasion of the celebration of the Emperor's birthday on April 29, an armistice was finally signed on May 5, 1932.

The League Commission of Inquiry The League of Nations' Commission of Inquiry, appointed in line with the resolution of December 10, 1931, and comprising the Earl of Lytton of Great Britain, Général de Division Henri Claudel of France, Major-General Frank Ross McCoy of the United States, Dr. Heinrich Schnee of Germany and Count Pldrovandi of Italy, arrived in Japan on February 29, 1932 accompanied by a party of their secretaries. The Commissions left Japan for China on March 11, and spent about four months to make investigations in China and Manchuria.

What the Commission learned was presented to the League of Nations on April 29 as a preliminary report.

In the course of this preliminary report, the Enquiry Commission stated that Manchuria was not under the authority of the Nanking Government and was infested by banditry, so that the Japanese troops could not be withdrawn, adding that the Nanking Government did not exercise its Power in any part of Manchuria in the prevailing situation.

The full text of the final report of the Commission was published at 9 p.m., Tokyo time, on October 2 in Tokyo, Geneva and Nanking simultaneously.

The contents of the report were considered comparatively impartial in its description of the outline of the history of the Sino-Japanese relations, Japan's interests in Manchuria and the general observations of the prevailing situation. However, that the Commission gave only a cursory account of the Shanghai incident, as if this incident had been outside the scope of its investigation work, was taken to show that the Commissioners did not fully understand what their true mission was. The Commissioners failed to recognize the military action taken by Japan on September 18, 1931, as an act of self-defence. The description of the circumstances pertaining to the founding of Manchoukuo was full of prejudiced misrepsesentations and the last two chapters containing what they called "principles and conditions of settlement" and "consideration and suggestions to the Council" were practically superfluous, especially after the de jure recognition extended to Manchoukuo by Japan.

Resolution of February 24 Following the publication of the Lytton Report, the League of Nations started its discussion thereon at the Council meeting convened on November 21, 1932, and, after complicated proceedings through the Assembly, the Committee of Nineteen and other committee meetings, a report with several recommendations was adopted by a vote of 42 to 1 on February 24, 1933, at the Assembly meeting, at which Siam abstained from voting and 12 countries were not represented.

The report was on the whole based upon the Lytton Report and was distinctly unfavourable for Japan and Manchoukuo, one of the recommendations contained therein purporting to recognize Chinese sovereignty and administrative integrity in Manchuria.

Japan's Withdrawal After voting against the report of the League of Nations Assembly on the Sino-Japanese dispute, the Japanese delegation to the

Digitized by Google

League meetings, headed by Mr. Yosuké Matsuoka, left Geneva without attending further meetings of the League, thereby expressing the firm determination of Japan.

In Japan, the Government decided on severance from the League of Nations and submitted a project to this end to the Throne. Accordingly the Privy Council met in plenary session on March 27, 1933, in the presence of the Emperor to recommend the project for Imperial sanction with a unanimous vote.

The Throne immediately sanctioned the project, a telegram was despatched to Geneva addressed to the Secretary-General of the League of Nations notifying the body of Japan's withdrawal from its membership, and simultaneously with this the Emperor issued an Imperial rescript announcing the policy to be followed by Japan after this action.

The official translation of the Imperial rescript follows :

"When the League of Nations came into being upon the restoration of a general peace, Our Imperial Father was pleased to order the entry of Our Empire thereinto ; and We, in Our turn, have laboured assiduously to fulfil the high purpose of the late Emperor. It is thus that Our Empire has for these thirteen years past extended consistently its co-operation to the League.

"Now Manchoukuo having of late been founded, Our Empire deems it essential to respect the independence of the new state and to encourage its healthy development, in order that the sources of evil in the Far East may be eradicated and an enduring peace thereby established. Unhappily, there exists between Our Empire and the League of Nations a wide divergence of view in this regard and it has devolved upon Us to cause Our government to take, upon mature deliberation, the necessary steps for the withdrawal of Our Empire from the League.

"However, the advancement of international peace is what, as evermore, We desire, and Our attitude toward enterprises of peace shall sustain no change. By quitting the League and embarking on a course of its own, Our Empire does not mean that it will stand aloof in the extreme Orient nor that it will isolate itself thereby from the fraternity of nations. It is Our desire to promote mutual confidence between Our Empire and all the other Powers and to make known the justice of its cause throughout the world.

"Every country is overtaken today by emergencies of an unprecedented magnitude. Our Empire itself is confronted by a situation fraught with momentous possibilities. It is indeed an hour that calls for an intensification of effort on the part of Our entire nation. We command that all public servants, whether civil or military, shall faithfully perform each his appointed duty, and that all private citizens shall pursue their wonted tasks with diligence. Stray not, in advancing, from the path of rectitude ; and in action, embrace always the golden mean. Strive to meet the present situation with a united will and with courage and resolution. So may ye carry forward the glorious work bequeathed by Our Grandsire and contribute to the prosperity and well-being of Mankind."

The Brussels Conference on the Sino-Japanese Conflict In September, 1937, the Nanking Government appealed to the League of Nations for urgent action in the conflict with Japan. The League Council immediately referred the appeal to the Advisory Committee, and issued an invitation to Japan, which she promptly refused. The League Council passed a decision of condemnation on Japan's action in China as a violation of the Nine-Power Treaty and the pact for renunciation of war and called a meeting of the signatories of the Nine-Power Treaty.

In consonance with the decisions of the League President Roosevelt made a speech indirectly referring to the Sino-Japanese conflict and putting blame on Japan, and later the State Department of the United States issued a statement against Japan in regard to the present affair. Great Britain and the United States of America worked in unison in convening a conference of the signatory Powers of the Nine-Power Treaty at Brussels. Japan was invited twice to the meeting but declined to attend, knowing well the unfriendly attitude of the League and the leading Powers toward her in the present situation, and feeling certain that no "just, equitable and realistic solution" of the Sino-Japanese conflict could be expected from the conference. With the refusal of Germany to participate in the Conference and Italy's strong support of Japan's stand the Brussels Conference could not come to any weighty decisions on the issue and adjourned without coming to any conclusion.

The following are the salient points contained in Japan's reply of October 27, 1937, to the first invitation extended by the Government of Belgium :

The League of Nations, in the report adopted by it on the 6th of this

Digitized by Google

month, has declared, on the basis of the statement made by only one of the two parties to the issue, that the military operations carried on by Japan in China are in violation of the Nine-Power Treaty. The action of Japan in China is a measure of self-defence which she has been compelled to take in the face of China's violent anti-Japanese policy and operations, especially expressed in provocative acts appealing to force of arms; and consequently, the issue is one which lies outside the purview of the Nine-Power Treaty.

The Assembly of the League of Nations has even gone the length of assuring China of its moral support and of recommending its members to abstain from any action that might weaken that country's power of resistance and add to its difficulties in the present conflict, and also to study how they might individually give aid to China. By this procedure, the League Council deliberately refused to take into account the just intention of the Imperial Government, who propose to bring about a sincere co-operation between Japan and China, to secure an enduring peace in East Asia, and to contribute thereby to the peace of the world. In other words, the method followed by the League is one of encouraging the hostile disposition of one of the parties, and of prolonging the conflict instead of bringing it to an early settlement.

The Royal Belgian Government make in their invitation no mention of the connection between the proposed Conference and the League of Nations. However, in view of the fact that in its resolution, the League of Nations has suggested a meeting of those of its members who are party to the Nine Power Treaty, and that the Government of the United States, who have acquiesced in the request of the Government of Great Britain for the convocation of the conference, have declared, on October 6, their approval of the Resolution, the Imperial Government cannot but conclude that the convocation of the conference is linked to the Resolution of the League of Nations. Now the League of Nations, as mentioned above, has expressed its views casting reflection upon the honour of Japan, and it has adopted a resolution which is incontestably unfriendly towards her.

In these circumstances, the Imperial Government are constrained to believe that a frank and full discussion to bring about a just, equitable and realistic solution of the conflict between Japan and China, cannot be expected from the Powers concerned at the proposed Conference.

Moreover, the present Sino-Japanese conflict arising from the special situation of East Asia has a vital bearing upon the very existence of the two countries. The Imperial Government are firmly convinced that an attempt to seek a solution at a gathering of so many Powers whose interests in East Asia are of varying degrees, or who have practically no interests there at all, will only serve to complicate the situation still further and to put serious obstacles in the path of a just and proper solution.

For these reasons explained above, the Imperial Government regret their inability to accept the invitation of the Royal Government.

The present conflict has been caused by none other than the Chinese Government who for these many years have been engaged as a matter of national policy in disseminating anti-Japanese sentiment and encouraging anti-Japanese movements in China, and who, in collusion with the communist elements have menaced the peace of East Asia by their virulent agitations against Japan. Consequently, what is most urgently needed for a solution of the conflict is a realization on the part of the Chinese Government of the common responsibility of Japan and China respecting the stability of East Asia, a revision of their attitude, and a change of their policy to that of co-operation between the two countries. What Japan asks of the Powers is that they comprehend fully this need. Their co-operation based upon such comprehension can alone, she believes, contribute effectively toward the stabilization of East Asia.

Sanctions against Japan On September 19, 1938, the Council of the League adopted China's appeal for the invocation of Article 17 of the League Covenant and sent an invitation to Japan, to which the latter replied declining to accept the invitation on the 22nd.

On the 30th of the same month, the Council adopted a report that the League members may individually apply Article 16 to Japan by virtue of paragraph 3 Article 17.

Complete Separation from the League On October 3, 1938, Japan announced the withdrawal of her cooperation with all committees of the League of Nations, stating, "Japan, even after her withdrawal from the League, has continued to copperate with that body in

Digitized by Google

social and technical fields. However, the League's organs even in these spheres have, since the outbreak of the present China Affair, gone beyond their proper duties and assumed a greatly deplorable attitude of indulging in political discussions and of slandering at every turn the actions of Japan in China. Now the adoption by the Council of the report concerning sanctions against Japan has made clear the irreconcilability between the position of Japan and the League, as a result of which Japan cannot but find it difficult to maintain the policy of cooperation she has hitherto pursued toward the League."

Relations with China

The Shanghai Affair Anti-Japanese feeling in China was increasingly accentuated following the Wanpaoshan affair, the conflict between Koreans and Chinese in Chosen and the Manchurian Incident in particular. Among other places Shanghai was the scene of most various and organized anti-Japanese activities, which culminated in the publication of an article disrespectful to the Imperial family of Japan by the Minkuo Jipao, a Chinese newspaper in Shanghai, in January, 1932. Shortly afterwards there occurred several untoward actions of the Chinese against the Japanese in the city.

The Japanese residents in Shanghai immediately held a mass meeting and lodged a strong protest with Wu Tieh-cheng, mayor of Shanghai.

Seeing the general situation, Consul-General Murai sent an ultimatum to the Chinese with a time limit set for 6 p.m. on January 28 and received a reply from Mayor Wu promising to suppress the anti-Japanese agitators and accept all the Japanese demands.

On the evening of January 28, however, Chinese crowds gathered around the municipal offices of Shanghai loudly accusing the mayor of having weakly yielded to the Japanese, and a serious situation threatened to prevail in all parts of the city, with the result that the Municipal Bureau of the International Settlement had to declare a state of siege, the foreign garrison forces taking up their positions in their respective areas of defence.

The situation, however, went from bad to worse, and the Japanese and Chinese troops came into a collision, which lasted from January 29 to March 3, when the former completely drove out the latter from the Chapei district.

On the completion of this achievement, General Shirakawa, commander of the Japanese expeditionary forces, and Vice-Admiral Nomura, commander of the Japanese fleet, ordered suspension of all hostilities at 2 p.m. on March 3.

Jehol Expedition The expedition carried out by the joint forces of Manchoukuo and Japan to Jehol to pacify this province of the new nation, and the subsequent truce concluded at Tangku between the hostile Chinese troops and the Japanese expedition on May 31, 1933, practically put an end to the long-protracted state of affairs popularly known as the Manchurian Incident.

The Jehol expedition, which was launched following a declaration to this end made by the Manchoukuo Government on February 26, 1933, announcing that it was despatching without delay necessary forces "to exterminate completely all bandits within and to dislodge all the invading armies from the province," was executed with amazing speed and on March 4 a Japanese contingent occupied Chengte, the capital of the province; a few days later the Japanese troops taking several important positions along the Great Wall.

After having been driven out of the province, however, the Chinese troops continued hostile operations on the Great Wall positions from the south, and the Japanese forces were obliged to advance south across the Great Wall more than once to destroy the bases of Chinese hostilities.

The Truce In fact, on the second occasion the Japanese advanced within a few miles of Peiping and Tientsin, but they refrained from actually entering these cities, and instead succeeded in including the representatives of the Chinese forces to sign a truce on March 31 at Tangku, providing for a demilitarized zone between Peiping and Tientsin districts and the Great Wall.

The Manchoukuo authorities, immediately after the pacification of Jehol, started a constructive programme in the province, readjusting finances and mapping out plans for future industrial and economic development for the people of the province.

Exchange of Ambassadors In July, 1924, Japan and China agreed on the exchange of ambassadors, but, due to the subsequent internal problems of China, the matter had been left unrealized. Sino-Japanese relations assumed a sudden turn for the better early in 1935. Taking advantage of this situation, Foreign Minister Koki Hirota made a proposal to the Nanking Government for the promotion of the Japa-

Digitized by Google

nese Legation in China to the status of an embassy and the matter was formally announced in Tokyo and Nanking at the same time on May 17. The Japanese Government promoted Mr. Akira Ariyoshi, Minister to China, to Ambassador, and the Chinese Government promoted General Tsiang Tso-pin, Chinese Minister to Tokyo, to Ambassador. At the initiative taken by Japan, both Great Britain and the United States at once promoted their Ministers in China to Ambassadors.

Incidents in 1935 Infringement of the Tangku truce pact on the Chinese side and violation of an official note exchanged between the Japanese and Chinese Governments regarding the retrocession of Tientsin in 1902 were the real causes of the North China incidents in 1935. Sun Yung-chin, bandit chieftain, with his followers, was expelled from Jehol Province by Japan-Manchoukuo combined forces to Shunhua in Hopei Province, where he was given support of a peace preservation corps under General Yu Hsueh-chung, chairman of the Hopei Provincial Government. It was discovered that General Yu supplied him with ammunition and foodstuffs. The Sun banditry, however, was subjugated by the Kwantung Army late in May, 1935. It was also found that General Ho Ying-chin, chairman of the Peiping branch of the National Military Council, had been giving bandits in Manchoukuo certificates of the Northeastern Volunteer Corps. All these were apparent instances of infringement of the Tangku truce pact.

Colonel Takashi Sakai, chief-of-staff of the Japanese Garrison in Tientsin, and Major Tan Takahashi, Japanese resident army officer in Peiping, called on General Ho on May 29 and blamed the dual policy of Generalissimo Chiang Kai-shek towards Japan, pointing out these two anti-Japanese incidents. They handed the following demands of Japan to the General Ho :

1. Dismissal of Yu Hsueh-chung who is directly responsible for the incidents and the evacuation of the Central Army of China from Hopei Province.

2. Dismissal of Chang Tingyo, Mayor of Tientsin, and Li Chunyo, Director of the Tientsin Public Peace Bureau, both directly responsible for the assassination.

On June 10 the Nanking Government replied that it accepted all the demands made by Japan.

Establishment of Two Governments Towards the close of November, 1935, an independent government was established with the demilitarized zone as the centre, which was named as the East Hopei Anti-Communist Autonomous Committee. Mr. Yin Ju-keng, special administrative inspector of the Lwanchow-Shanhai-kwan area of the zone, became its chairman. In December, the Committee was renamed as the East Hopei Anti-Communist Autonomous Government and appointed Mr. Yin its chairman.

The Kuomintang Government despatched its War Minister, General Ho Ying-ch'in to the north. As the result of his conference with General Sung Cheh-yuan and General Han Fu-chu the Hopei-Chahar Political Council was established as an organ to manage the administration of North China. General Sung Cheh-yuan was appointed as its chairman and assumed the office on December 18, 1935. This institution, while being under supervision of the Kuomintang Government, is a new political organ which has in its hand the power to negotiate with Japan and Manchoukuo for the maintenance of amicable relations with them. The domain over which the power of this political organ will be exercised comprises Hopei and Chahar Provinces, and Shantung, Suipuan and Shansi Provinces are governed by Han Fu-chu and Yen Hsi-shan respectively.

Sino-Japanese Questions in 1936 With reference to Sino-Japanese relations, mention must be made of the fact that the students' movement launched towards the end of 1935 served greatly to intensify the anti-Japanese sentiment throughout China. As a result, many terroristic actions were successively aimed at the Japanese residents and officers in China during 1936, beginning with January 21, 1936, when a police official named Sumida of the Japanese Consulate in Swatow was shot to death with a revolver while en route to his office.

Sino-Japanese Negotiations In view of the frequent anti-Japanese terroristic actions, the authorities of the Japanese Foreign Office and War Department resolved to open important negotiations with the Nanking Government with a view to preventing further aggravation of the situation and adjusting the relations between Japan and China.

The negotiations were commenced between Mr. Shigeru Kawagoé, the Japanese Ambassador to China, and General Chang Chun, the then Chinese Foreign Minister. Carrying the negotiations a step further, Ambassador Kawagoé had an interview with General Chiang Kai-shek, president of the Chinese Executive Yuan, on October 8. The negotiations were centered on the

Digitized by Google

North China question, the specific trade in North China, the control of anti-Japanese activities, the employment of Japanese advisers and the conclusion of a Sino-Japanese anti-Communist agreement.

The Chinese attitude towards the negotiations suddenly changed as a result of the outbreak of the East Suiyuan affair and on December 3 the negotiations in progress for nearly three months had to be discontinued. Two days later, Ambassador Kawagoé withdrew from Nanking to Shanghai.

East Suiyuan Question During the early part of November, 1936, skirmishes began to occur between the Chinese troops in Suiyuan Province and the Inner Mongolian forces in the eastern section of Suiyuan. On November 20, the central publicity headquarters of the Kuomintang, the Chinese Nationalist Party, issued a statement calculated to impress foreign countries that Japan was implicated in the Suiyuan affair, thus attempting to influence the negotiations in progress at the time between Mr. Shigeru Kawagoé, the Japanese Ambassador to China, and General Chiang Kai-shek, president of the Chinese Executive Yuan.

In order to clarify the situation, the Japanese Foreign Office also issued a statement on November 21, which read in substance as follows :

"Japan is always concerned over the conditions prevailing in the adjoining districts of Manchoukuo territory but she has nothing to do with the clash that took place between the Suiyuan troops and the Inner Mongolian forces. It hardly requires mentioning that the Japanese Army, not to say the Japanese Government, is not assisting the Mongols in any way."

Developments Following Sian Affair The Sian affair involving the forcible detention of General Chiang Kai-shek, president of the Chinese Executive Yuan and concurrently chairman of the National Military Council, by a group of troops under the control of Marshal Chang Hsueh-liang, the erstwhile Mukden warlord, suddenly occurred in the provincial capital of Shensi on December 12 but the Generalissimo returned safely to Nanking. Further, neither the Nanking Government nor the Kuomintang showed any agitation over the occurrence. These facts were taken to prove that the national unity of China had been greatly strengthened and accordingly, it came to be urged in various circles that China should he looked again in her new light.

It happened that the political change in Japan during March brought about the formation of the Hayashi Cabinet in succession to the Hirota Ministry. On March 3, Dr. Naotaké Sato who had just returned home with the intention of resigning from the post of Ambassador to France and retiring from active diplomatic service was appointed Foreign Minister of the new Cabinet. Speaking before the House of Peers and the House of Representatives, on March 8 and 11 respectively, Minister Sato set forth his foreign policy, which was well received abroad.

The Chinese interpreted Minister Sato's statements as meaning a revision of the three basic principles enunciated by Mr. Koki Hirota when he was Foreign Minister of the Okada Cabinet for adjusting Sino-Japanese relations. Further, as a result of the plenary session of the Central Executive and Central Supervisory Committees of the Kuomintang, which was held at Nanking in February, 1937, General Chang Chun was replaced by Dr. Wang Chung-hui, former judge of the Permanent Court of International Justice, as Foreign Minister of the Nanking Government. Following his assumption of the office, the new Chinese Foreign Minister emphasized that an adjustment of the relations between China and Japan should be based on the principles of reciprocity and equality.

In the meantime, there appeared increasing signs of a close cooperation between the Nanking Government and the Chinese Communist Army following the Sian affair. The movement launched by radical Chinese organizations for the establishment of a popular front against Japan was also intensified. All these combined to heighten the anti-Japanese sentiment among the Chinese people until finally they commenced to work desperately for placing North China under the complete control of the Nanking Government besides demanding dissolution of the East Hopei Anti-Communist Autonomous Government.

Under these circumstances, anti-Japanese outrages were repeated by the Chinese. On May 22, a police official of the Japanese Consulate at Swatow was subjected to violence. This caused the authorities of the Japanese Foreign Office to give warning that the sympathetic attitude which the Government and people of Japan had been manifesting towards China might be lost if the Nanking Government did not deal with the anti-Japanese activities in an appropriate manner.

Immediately following the outbreak of the Swatow affair, the Japanese

Digitized by Google

political situation underwent a change with the Hayashi Cabinet being replaced by a new Ministry formed under the Premiership of Prince Fumimaro Konoé, then president of the House of Peers. Ex-Premier Koki Hirota again assumed the portfolio of Foreign Affairs, which was interpreted by the Chinese to signify the revival of the so-called three Hirota principles. For this reason, they again accelerated their anti-Japanese movement and brought about conditions more unfavourable to an adjustment of Sino-Japanese relations.

The North China Incident On Wednesday night, July 7th, a small unit of Japanese troops was engaged in maneuvers on their usual grounds, near Marco Polo Bridge, southwest of Peiping, and in the vicinity of Lukouchiao and Lungwangmiao when suddenly, at 11:40 o'clock the Japanese troops were fired upon by Chinese soldiers from the directions of Lukouchiao and Lungwangmiao. The Japanese were utterly unprepared to return the fire, for they were only 150 strong and had a supply of live ammunition amounting only to one ball-cartridge per person, which was being kept by the commanding officer. All that they could do at this critical moment was to halt their maneuvers, concentrate at a spot some distance from the Chinese, and send for help to their headquarters, situated about two and a half miles away in the former British barracks at Fengtai. Reinforcements came quickly, and with the Japanese replying with real shots to the Chinese fire, the first clash occurred.

Matters went from bad to worse, the fight extending finally to the direction of Shanghai on August 13, 1937, and the event developed to a gigantic conflict between the two countries unprecedented in the history of either of them.

China Affair in 1937-39 Since the beginning of the Sino-Japanese conflict on July 7, 1937, two years have elapsed during which time the issue has developed into major hostilities, the termination of which still remains remote. Japan's desire to co-operate with China in order to bring about the mutual welfare and prosperity of the two great neighbouring peoples has been frustrated by the Kuomintang Government, and she is now engaged in eliminating the obstructionist forces in China so as to make possible the political and social regeneration of that country by assisting the Chinese people according to the principles of Oriental peoples on the basis of Japan's progressive experience of the past 80 years. Japan is confident that she can elevate thereby the cultural and economic levels of East Asia as a whole. But it is extremely regrettable that, in this case as in all others, destruction has had to precede construction.

The total area under Japanese occupation in China comprises the seven provinces of Chahar, Suiyuan, Hopeh, Shantung, Shansi, Kiangsu and Anhwei in their entirety, the greater part of Honan Province, wide areas in the four provinces of Chekiang, Kiangsi, Hupeh and Kwangtung and all of Hainan Island.

The Japanese occupied region in China covers an area of 1,562,938 square kilometres, about two-and-half times as large as Japan, the area of which is 675,365 square kilometres.

The proportion of the Japanese occupied area to China Proper, which has an area of 3,157,346 square kilometres, is 50 to 100, while the percentage of the Japanese occupied area to continental China (including the outlying provinces), which has an area of 10,059,877 square kilometres, is 16 to 100.

For the first 16 months of the conflict, hostilities were featured by mass troop movements and major engagements. The Chinese successively lost Shanghai, Nanking, Hsuchow, Canton and Hankow—crushing defeats all—before they were convinced that they could not stand before the superior arms of the Japanese. The fall of Hankow, on October 27, 1938, marked a turning point in Chinese military strategy. From that date, scarcely a week after the loss of Canton, the Chinese abandoned large-scale military operations and took resort to guerilla warfare and behind-the-lines "hit-and-run" tactics.

These new tactics favoured the Japanese. Already in control of the most important areas of the country, they were able to concentrate on the consolidation of these areas and the establishment of peace and order therein, which was effected by the strengthening of garrison forces in the rear, the organization of peace preservation committees and other measures of an effective nature.

Peace and order have been restored to a large extent in North and South China. In central China, resistance to pacification has been stronger than in the other regions, owing to the proximity of the Japanese occupied area to the Nationalist Government's shrinking domain. (See Chapter on China.)

CHAPTER VII

NATIONAL DEFENCE[1]

The Imperial Precepts to The Soldiers and Sailors

The forces of Our Empire are in all ages under the command of the Emperor. It is more than twenty-five centuries since the Emperor Jimmu, leading in person the soldiers of the Otomo and Mononobé clans, subjected the unruly tribes of the land and ascended the Imperial Throne to rule over the whole country. During this period the military system has undergone frequent changes in accordance with those in the state of society. In ancient times the rule was that the Emperor should take personal command of the forces; and although the military authority was sometimes delegated to the Empress or to the Prince Imperial, it was scarcely ever entrusted to a subject. In the middle ages, when the civil and military institutions were framed after the Chinese model, the Six Guards were founded, the Right and Left Horse Bureax established, and other organizations, such as that of the Coast Guards, created. The military system was thus completed, but, habituated to a prolonged state of peace, the Imperial Court gradually lost its administrative vigour; in course of time soldiers and farmers became distinct classes, and the early conscription system was replaced by an organization of volunteers, which finally produced the military class. The military power passed over entirely to the leaders of this class; through disturbances in the Empire the political power also fell into their hands; and for about seven centuries the military families held sway. Although these results followed from changes in the state of society and were beyond human control, they were deeply to be deplored, since they were contrary to the fundamental character of Our Empire and to the law of Our Imperial Ancestors. Later on, in the eras of Kokwa and Kaéi, the decline of the Tokugawa Shogunate and the new aspect of foreign relations even threatened to impair our national dignity, causing no small anxiety to Our August Grandfather, the Emperor Ninko, and Our August Father, the Emperor Koméi, a fact which We recall with awe and gratitude. When in youth We succeeded to the Imperial Throne, the Shogun returned into Our hands the administrative power, and all the feudal lords their fiefs; thus, in a few years, Our entire realm was unified and the ancient régime restored. Due as this was to the meritorious services of Our loyal officers and wise councillors, civil and military, and to the abiding influence of Our Ancestors' benevolence towards the people, yet it must also be attributed to Our subjects' true sense of loyalty and their conviction of the importance of "Great Righteousness." In consideration of these things, being desirous of reconstructing Our military system and of enhancing the glory of Our Empire, We have in the course of the last fifteen years established the present system of the Army and Navy. The supreme command of Our forces is in Our hands, and although We may entrust subordinate commands to Our subjects, yet the ultimate authority We Ourself shall hold and never delegate to any subject. It is Our will that this principle be carefully handed down to posterity and that the Emperor always retain the supreme civil and military power, so that the disgrace of the middle and succeeding ages may never be repeated. Soldiers and Sailors, We are your supreme Commander-in-Chief. Our relations with you will be most intimate when We rely upon you as Our limbs and you look up to Us as your head. Whether We are able to guard the Empire, and so prove Ourself worthy of Heaven's blessings and repay the benevolence of Our Ancestors, depends upon the faithful discharge of your duties as soldiers and sailors. If the majesty and power of Our Empire be impaired, do you share with Us the sorrow; if the glory of Our arms shine resplendent, We will share with you

1 Note: The Imperial Army and Navy are fundamentally reorganized since July, 1937, and all matters connected with the changes are kept secret as a matter of course. We are, therefore, obliged to give only what was known before the present wartime reorganizations, although an explanation of the revision in the military service law is given at the end of this chapter.

Digitized by Google

the honour. If you all do your duty, and being one with Us in spirit do your utmost for the protection of the state, Our people will long enjoy the blessings of peace, and the might and dignity of our Empire will shine in the world. As We thus expect much of you, Soldiers and Sailors, We give you the following precepts :—

(1) The soldier and the sailor should consider loyalty their essential duty. Who that is born in this land can be wanting in the spirit of grateful service to it? No soldier or sailor, especially, can be considered efficient unless this spirit be strong within him. A soldier or a sailor in whom this spirit is not strong, however skilled in art or proficient in science, is a mere puppet; and a body of soldiers or sailors wanting in loyalty, however well ordered and disciplined it may be, is in an emergency no better than a rabble. Remember that, as the protection of the state and the maintenance of its power depend upon the strength of its arms, the growth or decline of this strength must affect the nation's destiny for good or for evil; therefore neither be led astray by current opinions nor meddle in politics, but with single heart fulfil your essential duty of loyalty, and bear in mind that duty is weightier than a mountain, while death is lighter than a feather. Never by failing in moral principle fall into disgrace and bring dishonour upon your name.

(2) The soldier and the sailor should be strict in observing propriety. Soldiers and sailors are organized in grades, from the Marshal and the Admiral of the Fleet down to the private soldier or ordinary seaman; and even within the same rank and grade there are differences in seniority of service according to which juniors should submit to their seniors. Inferiors should regard the orders of their superiors as issuing directly from Us. Always pay due respect not only to your superiors but also to your seniors, even though not serving under them. On the other hand, superiors should never treat their inferiors with contempt or arrogance. Except when official duty requires them to be strict and severe, superiors should treat their inferiors with consideration, making kindness their chief aim, so that all grades may unite in their service to the Emperor. If you, Soldiers and Sailors, neglect to observe propriety, treating your superiors with disrespect and your inferiors with harshness, and thus cause harmonious co-operation to be lost, you will not only be a blight upon the forces but also be unpardonable offenders against the state.

(3) The soldier and the sailor should esteem valour. Ever since the ancient times valour has in our country been held in high esteem, and without it Our subjects would be unworthy of their name. How then may the soldier and the sailor, whose profession it is to confront the enemy in battle, forget even for one instant to be valiant? But there is true valour and false. To be incited by mere impetuosity to violent action cannot be called true valour. The soldier and the sailor should have sound discrimination of right and wrong, cultivate self-possession, and form their plans with deliberation. Never to despise an inferior enemy or fear a superior, but to do one's duty as soldier or sailor—this is true valour. Those who thus appreciate true valour should in their daily intercourse set gentleness first and aim to win the love and esteem of others. If you affect valour and act with violence, the world will in the end detest you and look upon you as wild beasts. Of this you should take heed.

(4) The soldier and the sailor should highly value faithfulness and righteousness. Faithfulness and righteousness are the ordinary duties of man, but the soldier and the sailor, in particular, cannot be without them and remain in the ranks even for a day. Faithfulness implies the keeping of one's word, and righteousness the fulfilment of one's duty. If then you wish to be faithful and righteous in any thing, you must carefully consider at the outset whether you can accomplish it or not. If you thoughtlessly agree to do something that is vague in its nature and bind yourself to unwise obligations, and then try to prove yourself faithful and righteous, you may find yourself in great straits from which there is no escape. In such cases your regrets will be of no avail. Hence you must first make sure whether the thing is righteous and reasonable or not. If you are convinced that you cannot possibly keep your word and maintain righteousness, you had better abandon your engagement at once. Ever since the ancient times there have been repeated instances of great men and heroes who, overwhelmed by misfortune, have perished and left a tarnished name to posterity, simply because in their effort to be faithful in small matters they failed to discern right and wrong with reference to fundamental principles, or because, losing sight of the true path of public duty, they kept faith in private relations. You should, then, take serious warning by these ex-

Digitized by Google

amples.

(5) The soldier and the sailor should make simplicity their aim. If you do not make simplicity your aim, you will become effeminate and frivolous and acquire fondness for luxurious and extravagant ways; you will finally grow selfish and sordid and sink to the last degree of baseness, so that neither loyalty nor valour will avail to save you from the contempt of the world. It is not too much to say that you will thus fall into a life-long misfortune. If such an evil once makes its appearance among soldiers and sailors, it will certainly spread like an epidemic, and martial spirit and morale will instantly decline. Although, being greatly concerned on this point, We lately issued the Disciplinary Regulations and warned you against this evil, nevertheless, being harassed with anxiety lest it should break out, We hereby reiterate Our warning. Never do you, Soldiers and Sailors, make light of this injunction.

These five articles should not be disregarded even for a moment by soldiers and sailors. Now for putting them into practice, the all important is sincerity. These five articles are the soul of Our soldiers and sailors, and sincerity is the soul of these articles. If the heart be not sincere, words and deeds, however good, are all mere outward show and can avail nothing. If only the heart be sincere, anything can be accomplished. Moreover, these five articles are the Grand Way of Heaven and Earth and the universal law of humanity, easy to observe and to practise. If you, Soldiers and Sailors, in obedience to Our instruction, will observe and practise these principles and fulfil your duty of grateful service to the country, it will be a source of joy, not to Ourself alone, but to all people of Japan.

The 4th day of the 1st month of
the 15th Year of Meiji.
(Imperial Sign Manual)

General

Special Position of Army and Navy The Japanese Army and Navy are under the direct command of the Emperor and neither the Government nor the Diet has any right to interfere in the strategic actions or the number of men or ships to be maintained. In making any decision on military and naval strength or the organization thereof, the Emperor consults the Chiefs of the respective General Staffs, who are thereupon required to submit their plans direct to His Majesty. The plans are then handed to the Prime Minister, who in his turn consults the Diet as to the necessary appropriations. Thus the Diet, while powerless to interfere with the actual naval and military projects, is entitled to determine the amount to be appropriated for their execution. If, however, the Service estimates are reduced in such a way as to render the original projects impossible of excution, this is deemed to be an infringement of the Imperial Prerogative under Article XII of the Constitution.

The Board of Field Marshals and Fleet Admirals This Board was created in 1898 as the Emperor's highest advisory body on military and naval affairs. Its members are at present as follows:

Field Marshal H. I. H. Prince Kan-in;
Field Marshal H. I. H. Price Nashimoto;
Fleet Admiral H. I. H. Prince Fushimi.

The High Military Council This is a larger advisory body which was created in 1887. Its membership includes, in addition to that of the above-mentioned Board, the Ministers of War and Marine, the Chiefs of the Naval and Military General Staffs and other generals and admirals specially nominated by the Emperor. Its functions are to advise the Emperor on all matters appertaining to war, especially on the correlation of the various departments of military administration, in the broader sense of the world. The Council may meet sections to deliberate and tender advice on issues concerning the Army or Navy separately.

Present members specially nominated by the Emperor are:

Lieutenant-General	H. I. H. Prince Asaka
Lieutenant-General	H. I. H. Prince Higashikuni
Admiral	Sankichi Takahashi
Admiral	Hisanori Fujita
General	Hisaichi Térauchi
Admiral	Nobumasa Suétsugu
Admiral	Minéo Ōsumi
Lieutenant-General	Kotaro Nakamura

The Military Service System[1] The system of compulsory military service in Japan is by no means a new one. It was established for the first time at the political innovation of Taika (646

1 **Note: In 1939 some important revisions are made in the system by the promulgation of the Law amending the Military Service Law, an explanation of which may be found at the end of this chapter.**

Digitized by Google

A.D.). And the system underwent a number of changes in course of time. It was improved greatly by the Taihoréi promulgated by the Mommu Tenno in the year 701 A.D. According to this law the whole country was divided into several military districts to facilitate the operation of the law and one-third of the youth in each district was compulsorily enlisted for military discipline. The number of the trained men in Japan in those days is said to have reached more than 100,000. A long period of peace then ensued, with the result that the law gradually dropped out of practice, giving room to the emergence of a division of people into two classes; namely, warriors on the one hand and farmers on the other.

The present law relating to military conscription was promulgated in 1872. By this law the conscription system of the country was brought back to what it was in the former times. This is numbered as one of the greatest achievements of the Meiji Tenno.

The fundamental aspects of the Japanese military service system are based upon the unique nature of the Japanese policy and the peculiar psychology of the Japanese people, who are not only willing, but deem it the highest honour, to serve in the army and the navy. All Japanese men, between 17 and 40 (except those who are disabled or those who have been imprisoned for six years or more) are required to serve.

The service is divided as follows:

(1) Jobi héi-éki (standing service). This is of two kinds: (a) Gen-éki (active service), 2 years for the army and 3 years for the navy; (b) Yobi-éki (1st reserve service), 5 years and 4 months for the army and 4 years for the navy.

(2) Kobi héi-éki (2nd reserve service), 10 years for the army and 5 years for the navy.

(3) Hoju héi-éki (replenishment reserve service). This is divided into two categories: — (a) First Supplementary Untrained Reservists, 2 years and 4 months for the army and 1 year for the navy, (b) Second Supplementary Untrained Reservists, 12 years and 4 months for the army and 11 years and 4 months for the Navy.

(4) Kokumin héi-éki (national service or Militia), extending in principle for the necessary period in either arm for the man to reach the age of 40.

Men are subjected to medical examination for conscription at the age of 20, and are classed as follows:

Class I; Class II, A, Class II, B; Class III; Class IV; and Class V. They are then allocated to the various categories of service according to their medical class as follows:

Medical Class	Description	Service to which Allocated
I, II A and B	Fit for active service.	Active service or replenishment reserve.
III	Fit for national service, but not for active service.	National service
IV	Unfit for any service.	Exempt from all service.
V	Nature of fitness undecided (may be included in Class I or Class II, A or B, in the following year.)	Allocation Postponed

They are then drafted to different branches of service according to the districts to which they belong and their ability and occupation.

Those who are fit for active service (Class I, Class II, A and B) are enrolled by lottery, at each conscription district, for active service or 1st or 2nd replenishment reserve. (Volunteer enrolments for active service are accepted.) Those having finished the period of active service are placed on the 1st reserve list for terms as stated above. At the end of such terms they are removed to the 2nd reserve, and then finally to the national service. Those who have gone through the period of replenishment reserve service are also transferred to the national service.

Sole supporters of families, and criminals sentenced to over 6 years' imprisonment or penal servitude are also exempt from service,. Those studying at certain schools, Government or private, which are recognized to be of equivalent or superior status to that of middle schools are exempt from conscription examination until the completion of their studies or until they attain their 27th year. Those staying abroad enjoy postponement of service under similar conditions, the age limit being 37.

By virtue of a revision of the conscription law in 1927, the active service of conscripts who have finished the course of a Young Peoples' School is reduced by six months, while that of the

Digitized by Google

graduates from normal schools by nineteen months. In other words, the former have to serve only eighteen months and the latter only five months, instead of full two years. A similar system of short term active service has also been adopted by the Navy.

The term of active service for graduates of middle schools and higher grade schools who have received full disciplinary training while at school and passed the final examination thereof is reduced to 12 months.

The conscription examination of such students is postponed till they reach the age of full 27 years.

After 3 month's active service they may be chosen as cadets and get special traning for the remaining 9 months. They may be promoted, according to ability, to either corporals or second lieutenants in the first reserve service at or after the expiration of active service. From among the graduates of technical or scientific departments of universities cadets may be chosen to supply engineers and technical officers of artillery and air forces.

Examination for Conscription According to medical examination, conscripts are classified into six grades as mentioned above. The figures for the past 8 years, 1928–1936, were as follows :

	Total Number Examined	Class I	Class II A	Class II B	Class III	Class IV	Class V
1928	568,796	171,744	64,970	119,783	171,758	39,861	680
1929	585,819	175,979	69,372	119,721	178,790	41,075	882
1930	595,505	174,482	69,275	121,961	187,863	40,989	938
1931	619,146	178,355	72,617	124,942	200,263	42,245	724
1932	621,844	174,282	71,556	125,938	207,401	41,951	716
1933	631,099	178,994	72,796	132,681	205,777	40,141	710
1934	641,969	185,432	72,979	135,275	206,810	40,822	651
1935	633,886	188,470	72,833	130,041	201,716	40,108	718
1936	630,802	195,832	73,722	134,744	186,610	34,316	578

Statistics on height and weight ascertained through the medical examinations for recent 8 years, 1928–1936, are as follows :

	Average Height	Average Weight
1928	1.596 m.	52.639 kg.
1929	1.602 m.	52.823 kg.
1930	1.598 m.	52.727 kg.
1931	1.600 m.	53.007 kg.
1932	1.600 m.	52.841 kg.
1933	1.602 m.	52.816 kg.
1934	1.603 m.	52.994 kg.
1935	1.603 m.	52.950 kg.
1936	1.603 m.	53.176 kg.

The grades of education attained by men examined for conscription in recent 8 years, 1928–1936, were :

	University	Higher School	Middle School	Higher Elementary School and Young People's School	Elementary School	Elementary School (Unfinished)	Uneducated
1928	81	1,209	43,309	266,611	209,413	42,200	5,973
1929	143	3,589	50,684	284,081	205,362	36,408	5,553
1930	493	7,303	65,944	296,829	197,312	31,812	4,812
1931	1,721	11,406	65,698	313,628	192,772	28,913	5,009
1932	3,741	13,188	69,147	324,204	182,064	25,323	4,177
1933	6,616	15,049	70,422	339,677	174,024	21,634	3,677
1934	9,031	16,467	72,622	356,135	165,240	18,802	3,672
1935	10,057	17,031	72,034	358,107	155,851	17,394	3,412
1936	10,285	17,155	70,992	373,823	140,910	14,591	3,046

Of those listed above as uneducated 3,463 for 1928, 3,045 for 1929, 2,873 for 1930, 3,090 for 1931, 2,543 for 1932, 2,268 for 1933, 2,433 for 1934, 2,220 for 1935 and 2,044 for 1936 were illiterates. The ratio of illiteracy, which was 4.28 per cent in 1903, 3.44 in 1911 and 2.17 in 1915, has been decreasing steadily, being 0.88 in 1925, 0.70 in 1927, 0.61 in 1928, 0.38 in 1934, 0.35 in 1935 and 0.32 in 1936.

Classified according to occupations of the households from which conscripts come in 1936, farmers head the list with 196,419 or 31.1 per cent of the total. Details follow :

Digitized by Google

Farmers	**196,419**
Fishermen	17,512
Miners	8,658
Industrial workers	192,348
Commercial workers	95,867
Transportation	24,486
Communications	5,807
Officials	16,698
Educators, priests, literary men, etc.	30,436
Miscellaneous	14,117
Unoccupied	28,454
Total	630,802

Volunteers The number of volunteers who are from 17 to 20 years of age, regulated by the Military Service Law, Article 7, was 25,891 in 1935 and 13,926 of which were allowed to enter the active service, a decrease of 182 in the number of volunteers and an increase of 1,132 in that of those who passed examination as compared with the previous year.

Conscripts and Leave of Absence Conscripts may return home to attend to family business for periods varying with the necessity of the case, but in no case exceeding 14 days. This departure from the general rule was proposed in 1919 to meet the convenience of the families of conscripts and was carried into effect at once.

Courts-Martial The Court-Martial Law provides that (1) all offences committed by officers and men shall be given public trial, (2) accused persons shall be given the benefit of counsel in their defence. Provision is also made for appeal.

The Army has eight courts-martial, namely, the High, the Divisional and six other temporary ones; the Navy has seven, the High, the Tokyo, the Admiralty and four other temporary ones. Courts-martial are always composed of judges (military or naval officers), law officials (civil) and clerks. The number of these varies in accordance with the nature of the court in question.

Gendarmerie The gendarmerie is under the control of the War Minister and mainly takes charge of military police, although it may assist civil or judicial police. Orders may, therefore, come from Ministers of Home Affairs and Justice. As military police its function is to see military laws and order kept. Guarding of military secrets, policing of fortress districts and naval stations, enforcement of laws concerning conscription, active service, calling out of the reserve, enforcing levy and martial laws, general surveillance of military discipline, and keeping order in war districts; these things come under its administrative responsibility. The searching and detection of crimes among military men, the collection of evidences and the arrest of culprits come under its judicial responsibility. The number of gendarmes is: Japan proper 1,450, Korea 490, Manchuria 190, and Formosa 90.

The Army

Outline History The Army under the Imperial régime was organized for the first time in the fourth year of Meiji (1871), when the samurai of the Kagoshima, Kochi and Yamaguchi clans formed an Imperial Bodyguard consisting of a few battalions, and four regular army divisions were established in Tokyo, Osaka, Kumamoto and Sendai. In January, 1873, the Government adopted a conscription system, by which members of all social classes were held equally liable for military service. The divisions in Nagoya and Hiroshima, which were established that year, were the first fighting units in this country to contain members of the farmer, merchant and other non-samurai classes. The total strength of the Japanese Army at that time was seven divisions consisting of about 36,000 men on peace standing and 46,250 on a war footing.

The number of soldiers to be mobilized was steadily increased after the Saigo Rebellion of 1877, but it was with this "cadre" of seven divisions that Japan defeated China in 1894-5. In the ten years following the Japan-China War, six more divisions were established with the result that Japan was able to put nearly one million men in the field during the Russo-Japanese War of 1904-5.

In 1922 Japan's Army strength reached twenty-one divisions consisting of 308,000 men on peace standing. The peaceful atmosphere in world affairs after the European War and the national financial condition made it necessary for Japan to reduce the army, and as the result of a readjustment effected between 1922 and 1924, a reduction of 1,800 officers, 56,000 men and 13,000 horses was made. This corresponds to a reduction of about five divisions on peace standing. In May, 1925, four more divisions (the 13th, 15th, 17th and 18th) was abolished, and the

Digitized by Google

present strength of the Japanese Army is 17 divisions and about 230,000 men on peace standing, inclusive of the Taiwan and Kwantung Armies.

Army Expenditure

The Army expenditure from 1893-94 down to 1937-38 have been as follows :

Year	Running Expenses	Extraordinary Expenses	Total
		(In yen)	
1893-94	12,420,000	2,301,000	14,721.000
(Just before Sino-Japanese War)			
1896-97	32,614,000	30,629,000	53,243,000
1903-04	39,353,000	7,529,000	46,884,000
(Just before Russo-Japanese War)			
1906-07	37,835,000	30,045,000	67,870,000
(Just after Russo-Japanese War)			
1912-13	80,175,000	23,950,000	104,125,000
1917-18	88,344,000	35,093,000	123,437,000
1923-24	176,224,000	47,704,000	223,927,000
1924-25	179,331,000	27,403,000	206,734,000
1925-26	170,761,000	44,044,000	214,805,000
1926-27	167,561,000	29,380,000	199,941,000
1927-28	174,190,000	43,913,000	218,104,000
1928-29	167,620,000	81,486,000	249,106,000
1929-30	178,898,000	48,356,000	227,255,000
1930-31	174,546,000	26,278,000	200,824,000
1931-32	163,679,000	63,808,000	227,488,000
1932-33	148,266,000	225,309,000	373,575,000
1933-34	166,471,000	296,173,000	462,644,000
1934-35 (Budget)	169,038,000	284,656,000	453,694,000
1935-36 („)	179,803,000	313,155,000	492,958,000
1936-37 („)	190,900,000	317,400,000	508,310,000
1937-38 („)	217,804,071	510,161,269	727,965,340
1938-39 („)	165,783,439	398,810,750	564,594,189

Note: For details of 1938-39 and 1939-40 budgets see Chapter VIII Public Finance, where the military expenditure in relation to the Sino-Japanese hostilities is given also.

Administrative Organization

Administration of the Army is conducted by the following three organs, the chiefs thereof working under direct order from the Throne :

The Ministry of War The central organ for military administration. The Ministry contains eight departments, the names and functions of which are listed below :

(a) The Minister's secretariat takes charge of all secret affairs, papers and other records, and general office work.

(b) The Bureau of Personal Affairs is in charge of all the affairs concerning the personnel of the army, It consists of two sections, the one dealing with appointments, promotion, etc., the other of decorations.

(c) The Bureau of Military Affairs is the real centre of military administration, and is responsible for the establishment of the system and organization of the Army, for the proclamation and withdrawal of martial law, and for all the affairs concerning ceremonies to be observed by the soldiers, morals and discipline among the men, the drafting of men and horses to various units, the conscription system, etc., etc.

(d) The Replenishment Bureau is divided into two sections, one for mobilization and the other for co-ordination, and is responsible for the establishment and improvement of the mobilization system, preparation and coordination of war supplies, improvement of military transportation, etc.

(e) The Arms and Ordnance Bureau consists of the section for rifles and guns and the section for various supplies. It is in the charge of arms, ordnance, and various supplies of war.

(f) The Intendance Bureau has four sections, the Paymaster's, Audit, Clothing and Provisions, and Construction. This bureau is responsible for expenditure, the inspection of accounts, preparation of budgets, provisions, clothing, structures, etc.

(g) The Medical Bureau is responsible for all sanitary and medical arrangements among officers and men. It con-

Digitized by Google

sists of the section for sanitary affairs and the section for medicine and surgery.

(h) The Judicial Bureau is responsible for the organization of courts-martial and all other affairs in connection with martial law.

The Ministry of War also supervises the following organizations situated in various parts of the country.

(a) The Military Aviation Bureau is the central organ for the study of military aviation, and is required to organize the education of pilots and mechanics, to supervise repairs, replenishment, and purchases of aeronautical supplies, etc.

(b) The Technical Investigation Bureau conducts researches on all technical developments likely to effect military efficiency. Inspection of ordnance and various war supplies is conducted by this bureau. Under its supervision is the Laboratory of Military Science which conducts research on methods of scientific warfare.

(c) The Military Technical Board. This is an organ for deliberation on all technical problems submitted by the War Minister.

(d) The Military Arsenal is responsible for the establishment of designs and plans of arms and ordnance, as well as repairs and examination of various supplies of war inclusive of gunpowder. It has branches in Osaka, Nagoya, Oji, Kokura and Héijo.

(e) The Woolen Factory at Senju is engaged in the manufacture of woollen yarn and clothes, for military supplies.

(f) The Remount Bureau has charge of horse replenishment, including breeding and purchase.

(g) The Military Arms Depot is responsible for the purchase, storage, repairs, maintenance, supply, exchange, and scrapping of arms and ordnance. It also takes care of the guns installed in fortresses. The main office is in Tokyo and there are branches in Chiba, Osaka, Nagoya, Kokura, and Hiroshima.

(h) The Military Clothing Depot has its head office in Tokyo, and branches in Osaka and Hiroshima. It takes care of the manufacture, purchase, storage, and supply of all clothing supplies.

(i) The Military Hygienic Supplies Depot is responsible for the manufacture, purchase, storage, supply, and inspection of all hygienic supplies.

(j) The Military Depot of Provisions and Forage, with its head office in Tokyo and branches in Osaka and Ujina, is in charge of the preparation and supply of provisions and forage.

(k) The Fortifications Bureau is responsible for the construction, inspection, and maintenance of all defensive structures, besides being required to conduct researches on artillery and military engineering.

(l) The Military Transport Bureau is situated at Ujina and looks after all matters concerning the transportation of troops.

The General Staff It deliberates on national defence and strategy. It is also required to train and supervise all staff officers. The Staff College and the Land Survey Bureau are under the control of the Chief of the General Staff.

The Land Survey Bureau is responsible for the replenishment of military maps, production of maps for public use and the training of experts for the Bureau services.

The Department of Military Training It is in charge of all military schools and the training and education of officers and men, as well as the co-ordination and development of military education; aeronautical education of military aviation, however, is entrusted to the Aviation Bureau, and the training of staff officers comes under the General Staff.

The Department consists of the headquarters and sections for cavalry, artillery, engineers and commissariat.

Field Organization

The Division A division generally consists of 2 infantry brigades, 1 cavalry regiment, 1 engineer battalion, and 1 commissariat battalion. To some larger divisions, a tank corps, or a mountain artillery regiment, or a heavy field artillery regiment, is attached. While a few others include a full cavalry brigade, a regiment of transport or an anti-aircraft regiment. Eight ammunition columns (4 infantry and 4 artillery), 6 field hospitals, and 1 remount depot accompany each division on service. The number is about 10,000 on peace standing. Divisional commanders hold the rank of Lieutenant-General, brigade commanders that of Major-General.

The Regiment An infantry regiment consists of 3 battalions and a machine-gun corps, and an infantry battalion of 3 companies of 150 men each, and a machine gun section. A company is subdivided into three sections.

A cavalry regiment, of which Japan has 25 at present, consists of 2 or 3 squadrons. Eight of these regiments are organized into four independent cavalry brigades, while the remaining seventeen

Digitized by Google

are attached one to each of the divisions.

Japan has 30 artillery regiments and 10 battalions, namely 15 regiments of field artillery, 1 battalion of horse artillery, 4 regiments and 1 battalion of mountain artillery, and 8 regiments of heavy field artillery. A field artillery regiment is divided into 3 battalions, and a battalion into 3 companies. On peace strength a field artillery regiment consists of only 6 batteries each equipped with four guns. In addition there are 3 regiments and 8 battalions of heavy artillery, which are responsible for the defence of fortified zones.

In peace time 1 regiment and 1 battery of anti-aircraft artillery are maintained.

Air Force Japan's air force is divided into units attached to the Army and Navy respectively. The Army air force consists at present of 11 reconnoitering squadrons, 11 fighting squadrons, 4 bombing companies, and 2 balloon companies, consisting of approximately 1,000 planes.

The Peace Strength

A full statistical classification of the peace strength of the Army, with the total number of soldiers nearly 250,000, in 1936, is given below. In addition to the units listed, a force of gendarmerie 2,220 strong and a medical corps, about 1,500 strong are maintained.

Units	No. of Complete Regiments	No. of Additional Battalions
Infantry	70	6
Cavalry	25	—
Field Artillery	14	—
Mountain Artillery	5	1
Mounted Artillery	—	1
Heavy Field Artillery	8	—
Heavy Artillery	3	8
Engineers	—	17
Railway Corps	2	—
Telegraph Corps	2	—
Air Force	9	—
		(corps)
Balloon Corps		1
Commissariat		15
Tank Corps		2
		(corps)
Anti-Aircraft Artillery	1	1

This force is divided into 17 divisions and 34 brigades and was stationed in December, 1935 as follows:

Imperial Guard Division

(17)	Ryojun (Port Arthur)	Kwantung Army

Promotion and Age Limit

Army officers in service are promoted to higher ranks by selection in accordance with the following rules in time of peace, the time limit being reduced by one-half in war time :

One year from Sub-Lieutenant to Lieutenant, 2 years from Lieutenant to Captain, 4 years to Major, 2 years to Lieutenant-Colonel, 2 years to Colonel, 2 years to Major-General, 3 years to Lieutenant-General. Promotion to full General and then to Marshal is subject only to the Emperor's will.

The age limit for officers on the active list varies according to rank as follows :

General	65
Lieutenant-General	62
Major-General	58
Colonel	55
Lieutenant-Colonel	53
Major	50
Captain	48
Lieutenant and Sub-Lieutenant	45

There is no age limit for Marshals.

Army Education

Schools providing instruction in military affairs are of three categories as follows :

(1) Those under the authority of the Department of Military Education, of which a full list is given below :

Name	Place
Artillery and Engineering School	Tokyo
Infantry School	Chiba prefecture
Cavalry School	,, ,,
Field Artillery School	,, ,,
Heavy Field Artillery School	Kanagawa prefecture
Engineers' School	Chiba ,,
Signallers' School	Tokyo ,,
Mechanical Transport School	,, ,,
Narashino Military School	Chiba prefecture
Toyama School	Tokyo city
Military Academy	,, ,,
Military Preparatory School	,, ,,
5 Non-Commissioned Officers' Schools	Tokyo, Sendai, Toyohashi, Kumamoto

Toyama School teaches fencing, gymnastics and military music to both officers and men.

(2) The Staff College (Tokyo City) under the direct control of the General Staff.

(3) Those under the control of various bureaux of the Ministry of War, of which a full list is given below :

Name	Place
Tokorozawa Flying School	Saitama prefecture
Akéno Flying School	Miyé prefecture
Hamamatsu Flying School	Shizuoka prefecture
Shimoshizu Flying School	Chiba prefecture
Engineering School	Tokyo City
Intendance School	Tokyo City
Army Medical School	Tokyo City
Army Veterinary School	Tokyo City
Gendarmerie Training School	Tokyo City

The Flying School at Tokorozawa is to give necessary training to military fliers as to how to handle and repair a plane and its engine, and meteorogical observation, besides a knowledge of the materials of which planes and engines are constructed. This school is opened to civilian students. The Flying School at Shimoshizu is to teach aerial photography, aerial communications and

Digitized by Google

reconnoitering. The Akéno Flying School gives courses to army pilots on the aerial tactics, air navigation, handling of machine-guns on a plane and also on the construction of aerial weapons.

To raise the level of educational capacity and general efficiency among officers, certain special courses and facilities are arranged. Graduates from universities in science or engineering are now entitled to the position of engineer of artillery lieutenants after six months' cadetship, while those from the medical and agricultural colleges are qualified to become surgeon and veterinary lieutenants respectively after three months' cadetship. Non-commissioned officers of ability may be promoted to the rank of lieutenant in virtue of a system adopted in 1930, after a short period of special training. Posts still higher, even to the supreme Marshalship, are open to non-commissioned officers of exceptional ability.

The Navy

Outline History As a result of the policy of seclusion strictly followed by the Shogunate Government of the Tokugawas, Japan was without anything worthy of the name of a navy, when Commodore Perry's fleet entered Uraga Bay in the 6th year of Kaéi (1853) with a view to inducing the Shogun's Government to open Japanese ports to the world. By the 4th year of Anséi (1857), however, Japan was in possession of a few warships given her by Holland and England. They formed the first squadron of the Western type that the nation ever had. By the efforts of the Meiji Government, this squadron developed into an efficient fleet of 28 fighting craft and 24 torpedo-boats, with a total tonnage of over 50,000 tons by 1894, when Japan declared war on China. After the Sino-Japanese War, Japan's navy grew very rapidly and in 1902, just before the outbreak of Russo-Japanese War, was in possession of 78 ships with a total tonnage of 256,816 tons.

The Naval Policy Japan's naval policy was, and is, to maintain a fleet powerful enough to defend the country against any naval force which could be dispatched to the western Pacific by any naval Power of the world. This policy was embodied first in the expansion plan adopted in 1907, including the construction of 8 battleships, 8 battle-cruisers, 21 light cruisers, 64 destroyers, and 32 submarines. As a preliminary to carrying out the plan, it was decided to build 8 battleships, 4 battle-cruisers, 11 light cruisers and a number of destroyers and submarines at a total expenditure of ¥254,000,000. In 1916, the Diet passed the programme to be carried out in the seven years ending 1923. In 1917, the programme was enlarged by a project covering the construction of 2 more battle-cruisers and a number of auxiliary ships in the six years ending 1923. In 1919, this programme was enlarged by a new project covering the construction of 8 capital ships and 85 auxiliary ships at a total expenditure of ¥750,000,000 to be appropriated in the eight years ending 1927. Thus, in 1921, Japan's naval expenditure amounted to about ¥500,000,000 or about one-third of the total amount of the budget.

The 1919 Programme The number and kind of ships to be constructed by the 1919 plan were 8 battleships armed with 16-inch guns (Nagato, Mutsu, Tosa, Kaga, etc.) and 8 battle-cruisers (Amagi, Akagi, etc., etc.) 26 light cruisers, 94 destroyers, and 93 submarines. As a result of the Washington Conference, the construction of these ships was abandoned, the Mutsu and the Nagato being retained on the list, while the Akagi and the Amagi were retained for conversion into plane carriers. (The great earthquake of 1923 made the Amagi unfit for service, and she was replaced by the Kaga).

After the Conference every effort was made to build up a powerful fleet of auxiliary ships to compensate for the deficiency in capital ships, of which Japan was allowed only 9 as against the 15 each of America and Britain. This effort resulted in the establishment of a well balanced fleet of auxiliary ships. The Naval Treaty signed in London in 1930, however, again gave Japan a low ratio in the number and tonnage of eight-inch gun cruisers, and allowed her only 52,700 tons of submarines, in spite of her demand for a minimum of 78,000 tons. This made it necessary further to reinforce the auxiliary fleet.

The 1931 Plan In 1931, the First Naval Replenishment Plan was referred to the Diet which passed it almost unanimously. The plan covers the construction of 4 light cruisers of 8,500 tons each, 12 first class destroyers of 1,400

Digitized by Google

tons each, 9 first class submarines, 1 large mine-layer, 3 smaller mine-layers, 4 torpedo-boats, and 6 mine-sweepers, at a total expenditure of ¥247,080,000 to be appropriated in the 6 years.

The 1932 Plan The replenishment plan is accompanied by two other plans, the first of which covers the establishment of 12 naval flying corps on land and an aeronautic arsenal, the improvement and reinforcement of other ships, and the improvement of planes carried on plane-carriers and arms to be mounted on naval planes. The total expenditure for this, amounting to ¥81,970,000, is to be voted by 1936. On its completion, the plan is to be followed by another expansion plan covering the establishment of 2 more flying corps on land at a total expenditure of ¥50,000,000. The second plan supplementary to the 1931 Replenishment Plan covers a total expenditure of ¥44,950,000 to be appropriated for the modernization of capital and auxiliary ships, plane-carriers, submarines, and the replacement of guns, etc. When these replenishment programmes are completed, Japan will have 12 Treaty cruisers, 23 light cruisers, 4 plane-carriers, 4 submarine tenders, 6 mine-layers, 8 coast defence ships, 13 gunboats, 79 first class destroyers, 34 second class destroyers, 33 first class submarines, 38 second class submarines, 4 torpedo-boats, 14 mine-sweepers, 3 training-ships, 1 target ship, 2 surveying ships, 17 transports, and 1 ice-breaker.

The naval authorities referred a second naval replenishment plan to the Ministry of Finance for study on October 31, 1932. The plan calls for a total expenditure of ¥460,000,000 covering the construction of one plane-carrier of 8,000 tons, two 8,500 ton cruisers with 6-inch guns, 14 first class destroyers of 1,400 tons each, six submarines, one mine-layer of 5,000 tons type, a number of torpedo-boats and mine-sweepers, and the establishment of 8 flying corps on land, all for completion in the 4 years ending 1936.

Improvement In 1935 the Second Air Force Squadron was added to the Second Fleet which was composed of the Akagi, aircraft carrier, and 9th destroyer flotilla.

Naval defence on Chinese seas was formerly divided into three sections, i.e. north China defended by boats under the Ryojun Minor Naval Station, central China defended by the Third Fleet and south China by boats under the Bako Minor Naval Station. These three were united into one in 1935 and is now defended by the Third Fleet which was composed of the 10th and 11th Squadrons and the 5th Destroyer Squadron.

In addition to the naval barrack which had been instituted in 1933 defence corps were organized in 1935 to reinforce the coastal defence (see "The Three Districts", this Chapter).

An air force enlargement plan has been carried out according to the first and second programmes. Kuré and Saéki air corps were completed, and the four corps at Kisarazu, Maizuru, Tomioka (Yokohama) and Shikaya (Kagoshima prefecture) are to be completed by the end of 1936.

In educational line improvements were made by prolonging school years in Naval College, Naval Engineering College and Naval Paymasters' College from 3 years 8 months to 4 years, and a greater number of freshmen were taken into these colleges.

Naval Expenditure

The naval expenditure from 1893-94 down to 1937-38 have been as follows (As to the minutes of the 1937-38 budget, see Chapter VIII, Public Finance, Budget for 1937-38.)

Year	Running Expenses	Extraordinary Expenses (In Yen)	Total
1893-94 (Just before Sino-Japanese War)	5,141,000	2,960,000	8,101,000
1896-97 (Just after Sino-Japanese War)	7,351,000	12,655,000	20,006,000
1903-04 (Just before Russo-Japanese War)	21,530,000	14,588,000	36,118,000
1906-07 (Just after Russo-Japanese War)	27,991,000	33,885,000	61,876,000
1912-13	41,534,000	53,952,000	95,486,000
1917-18	48,528,000	113,906,000	162,434,000
1925-26	122,242,000	106,761,000	229,003,000
1926-27	127,428,000	109,879,000	237,307,000
1927-28	136,545,000	136,992,000	273,537,000
1928-29	143,026,000	125,106,000	268,132,000

Digitized by Google

Year	Running Expenses	Extraordinary Expenses (In Yen)	Total
1929-30	147,648,000	120,016,000	267,664,000
1930-31	146,888,000	95,147,000	242,035,000
1931-32	138,914,000	88,215,000	227,129,000
1932-33	140,740,000	172,069,000	312,809,000
1933-34	179,027,000	230,948,000	409,975,000
1934-35 (budget)	199,909,000	289,237,000	489,147,000
1935-36 („)	215,917,000	313,765,900	529,683,000
1936-37 („)	236,750,000	313,640,000	550,390,000
1937-38 („)	273,953,380	407,700,236	681,653,616
1938-39 („)	293,382,149	383,976,291	677,358,440

Note: For details of 1938-39 and 1939-40 budgets see Chapter VIII, Public Finance, where the Navy expenditure in relation to the Sino-Japanese hostilities is given also.

Administrative Organization

Warships and other vessels organized into fleets and squadrons actually represent what is called the Japanese Navy, and all the organs under the jurisdiction of the Ministry of Marine are intended for the construction, maintenance, control and successful utilization of these vessels. Each naval station and fleet is placed in the charge of a Commander-in-chief, who is responsible for the discipline and education of his men.

The Minister The Minister of Marine is in charge of the administration of the Navy, while the Chief of the Naval Staff is directly responsible to the Emperor for operation, mobilization and intelligence. The administrative departments under the supervision of the Minister of Marine are the following:

(1) Ministerial Secretariat
(2) Bureau of Military Affairs
(3) Personnel Bureau
(4) Education Bureau
(5) Bureau of Stores
(6) Medical Bureau
(7) Bureau of Accounts and Supplies
(8) Bureau of Civil Engineering
(9) Bureau of Judicial Affairs
(10) Library
(11) Telegraphy Division

The schools under the supervision of the Minister are:

(1) Naval War College (Tokyo). This school is intended for the training of advanced students selected from among naval officers.

(2) Naval College (Etajima). This school is intended for the education of intending naval officers. Warrant officers are also educated here before they are promoted to the rank of special service officer.

(3) Naval Engineering College (Maizuru). This school is intended for the education of intending engineering officers. Warrant engineering officers are received under the same conditions as at the Naval College.

(4) Naval Medical College. This school is to train surgeons and pharmacists and to conduct research in the field of surgery, medicine and naval sanitation. Warrant Ward masters are educated here before they are qualified for the rank of Wardmaster Lieutenant.

(5) Naval Paymasters' College. This school is intended for the education of intending naval paymasters. Warrant Writers are educated here before they are qualified for the rank of Accountant Lieutenants.

Under the Commander-in-Chief The following schools are under the direct supervision of the Commanders-in-Chief of the Naval Stations.

(1) Naval Gunnery School (Yokosuka). Officers, special service officers, warrant officers and seamen of special-ratings are admitted.

(2) Torpedo School (Yokosuka). Officers, warrant officers and seamen specially selected are admitted.

(3) Naval Communication School (Yokosuka). Officers, warrant officers and seamen specially selected are admitted.

(4) Navigation School (Yokosuka). Officers, warrant officers and seamen specially selected are admitted.

(5) Submarine School (Kuré). Officers, warrant officers and seamen specially selected are trained here for submarine warfare. Researches on submarine construction and operation are also conducted.

(6) Naval Machinists' School (Yokosuka). This school is for the training of warrant officers and seamen aspiring to the rank of engineering officer, or special service engineering officer, or shipwright.

Active Service Organization

The Three Districts The coasts of

Digitized by Google

Japan and the seas surrounding the country are divided into three Naval Districts, and these districts are placed in the charge of naval stations as follows :

1st Naval District, consisting of the coasts of Aomori, Iwaté, Miyagi, Fukushima, Ibaraki, Chiba Tokyo, Kanagawa, Shizuoka, Aichi, Miyé, Hokkaido and Karafuto, and the adjacent seas, is in the charge of the Yokosuka Naval Station.

2nd Naval District, consisting of the coasts of Wakayama, Osaka, Hyogo, Okayama, Hiroshima, Yamaguchi, Shimané, Tottori, Kyoto, Fukui, Ishikawa, Toyama, Niigata, Yamagata, Akita, Tokushima, Kochi, Ehimé, Kagawa, Oita, Miyazaki, and the eastern part of Fukuoka prefecture, and the adjacent seas, is in the charge of the Kuré Naval Station.

3rd Naval District, consisting of the coasts of the remainder of Fukuoka prefecture, Saga, Nagasaki, Kumamoto, Kagoshima, Okinawa, Taiwan and Chosen and the adjacent seas, is in the charge of the Sasébo Naval Station.

The coasts and adjacent seas of the South Sea Islands, now under mandate to Japan, are in the charge of the Yokosuka Naval Station. There are also minor naval Stations at Maizuru in Kyoto prefecture, Ohminato in Aomori prefecture, Chinkai in Chosen, Bako in the Boko Islands (Pescadores) and Ryojun (Port Arthur) in Kwantosyu (Kwantung).

The naval districts have each a naval barrack, which is responsible for the defence of the naval port where it is posted, besides being required to protect the neighbouring district from attack. In addition to the naval barrack, each naval station or minor naval station has a defence corps, which is responsible for the defence of the neighbouring seas. Where there is no naval barrack, the defence corps is required to take care of the port where it is stationed and to protect the neighbouring district from attack. The naval ports and minor naval ports have respectively one or more air force detachments, which are required to protect the port and neighbouring district from naval and aerial raids.

Naval Office in Manchoukuo

Japan's recognition of Manchoukuo and provisions of the Japan-Manchoukuo Protocol necessitated military and naval actions in that country on the part of Japan and to meet the emergency the Naval Department of Japan issued a law in March, 1933, for the establishment of the Naval Department in Manchoukuo to be located in Hsinking.

The Office takes charge of the watch and protection of the rivers and the coast lines of Manchoukuo. The commander is directly under the Emperor, and as to the administration he acts in accordance with the order of the Minister of the Navy of Japan. At present a provisional Naval Defence Brigade is quartered at Harbin and is guarding the banks of the Sungari.

Ryojun (Port Arthur) Naval Station The Imperial Naval Station at Port Arthur was abolished in November, 1922, according to the Naval disarmament programme. But the newly created situation in Manchuria made it a matter of necessity to revive it and it was re-established in April, 1933. The station is under a special regulation independent of the Naval stations in home land. It has specific duties in the Kwantung Leased Territory and is engaged in the protection of the coasts of Kwantung Province, Manchoukuo and the North China above the Yangtze.

The Standing Fleets

The standing fleets as reorganized on November 3, 1936, are as follows:

Combined Fleet

The Combined Fleet is organized with the 1st, 2nd fleets and the 12th Squadron, Mamiya and Naruto appended.

1st Fleet

1st Squadron—Nagato, Mutsu, Hyuga.
3rd Squadron—Haruna, Kirishima.
8th Squadron—Kinu, Natori, Yura.
1st Destroyer Squadron—Kawachi, 9th and 21st destroyer flotillas.
1st Submarine Squadron—Isuzu, 7th and 8th submarine flotillas.
1st Air Force Squadron—Hosho, Ryujo, and 30th destroyer flotilla.

2nd Fleet

4th Squadron—Takao, Maya.
5th Squadron—Nachi, Haguro, Ashikaga.
2nd Destroyer Squadron—Jintsu, 7th, 8th and 19th destroyer flotillas.
2nd Submarine Squadron—Jingéi, 12th, 29th and 30th submarine flotillas.
2nd Air Force Squadron—Kaga, 22nd destroyer flotilla.
12th Squadron—Okishima, Kamoi, 28th destroyer flotilla.

3rd Fleet

10th Squadron—Izumo, Tenryu, Tatsuta.
11th Squadron—Ataka, Toba, Séta, Katada, Hira, Hotzu, Atami, Futami, Kuri, Tsuga and Hasu.

Digitized by Google

5th Destroyer Squadron—Yubari, 13th and 16th destroyer flotillas.
Saga is appended.

Training Squadron

Yakumo and Iwaté.

The Naval Air Force

The Naval Air Force consists of :
(1) 7½ aeroplane corps at Kasumigaura, 5 aeroplane corps at Yokosuka, 5½ aeroplane corps at Tatéyama, 1½ aeroplane corps at Sasébo, 2½ corps at Omura, 1½ corps at Kuré, 1½ Corpse at Sahéki and 1½ Corps at Ominato, the number of planes belonging to these air corps are unavailable ; and (2) the aircraft-carriers proper, Kaga, Akagi, Hosho, Notoro, Ryujo, Kamoi and several other ships, the number of planes carried are unavailable. Flying officers and men number over 10,000.

The Personnel

Classified according to ranks, naval officers on the active list were as follows at the end of 1934 :

Admirals to Rear-Admirals and non-executive officers	148
Captains to Lieut.-Commanders and non-executive officers	2,395
Lieutenants to 2nd Sub-Lieutenants, non-executive officers, midshipmen and special service officers	3,958
Warrant officers	1,953
Cadets at school	348
Total	8,802

Equipment Each naval station is equipped with a shipbuilding yard, and one or more dry docks for accomodating warships. The Yokosuka and Kuré arsenals are capable of taking in superdreadnoughts of over 40,000 tons, but those of Sasébo and Maizuru are only fit for building cruisers and smaller ships. There are a number of up-to-date private establishments, such as the Mitsubishi shipyard at Nagasaki, Kawasaki shipyard at Kobé, Fujinagata shipyard at Osaka, and Ishikawajima shipyard at Tokyo. Of these the Mitsubishi and Kawasaki shipyards are capable of building superdreadnoughts.

Warship Building

The first warship built in Japan was the Séiki (870 tons) launched at Yokosuka in 1875. She played an important part in the civil war of 1877. The Hashidaté (4,228 tons), launched just before the Sino-Japanese War of 1894-5, remained the largest warship built at home until 1903. Soon after the Russo-Japanese War, Japan succeeded in building the battle-cruisers Tsukuba (13,800 tons), Ikoma, and Kurama (14,600 tons each), the battleships Satsuma (19,300 tons), Aki (19,250 tons), Kawachi and Settsu (20,800 tons each). The two last named were the first dreadnoughts planned and constructed at home and marked a new stage in the progress of naval architecture in Japan.

The Tsukuba and Kawachi sank 18 and 17 years ago respectively as a result of an explosion of their magazines, the former at Yokosuka and the latter at Tokuyama, while the Satsuma and Aki were removed from the list and sunk in target practice. The Settsu has been converted into a target ship of 16,130 tons and is still in service.

Independent of Foreign Material Up to recent years, Japan was dependent on foreign countries as regards war material, but is now almost independent in this connection. She has ample supplies of coal, iron, copper and zinc as long as she controls the mines in Manchuria. At present 95 per cent of warship building materials is of home production and in case of international competitive building of warships Japan will lose little out of the competition in international payments. The supply of crude oil as still insufficient, but the rapid progress in the oil-shale industry of Manchuria, and the remarkable development of the oil industry in North Saghalien, Formosa, etc., show that the empire will shortly be self-sufficing in this respect also. The Imperial Iron Works at Yawata (Kyushu) has an annual output of about 200,000 tons armour plates, rails, etc., while the Muroran Steel Works of Hokkaido is turning out an ample quantity of steel for use by the Army and Navy. In the chemical industry also, Japan is now almost independent and prepared for any form of chemical warfare.

List of Ships

The Navy consisted on September 30, 1936 of the following ships, classified by types with the total tonnage in each :

Type	No.	Tonnage
Battleships	9	272,070
Training Battleship	1	19,500
1st Class Cruisers	12	107,800
2nd Class Cruisers	25	107,255
Aircraft Carriers	6	68,370
Seaplane Carriers	3	31,050
Submarine Tenders	5	31,015
Mine Layers	6	19,630

Digitized by Google

Type	No.	Tonnage
Coast Defence Vessels	7	55,450
Gun Boats	11	5,045
1st Class Destroyers	80	95,479
2nd Class Destroyers	30	23,390
1st Class Submarines	37	49,157
2nd Class Submarines	25	20,927
Torpedo Boats	12	2,108
Mine Sweepers	12	6,642
Special Service Ships	21	219,935
Total	302	1,134,823

(Tonnage of ships under construction is not included. The full individual list of warships at the same date is given in the Japan Year Book, 1937.)

The Planes

The battle planes in use in the Naval Air Force are of type 3 and type 90. The bombers and torpedo planes in use are of type 13, type 89 and type 92. Some of these machines played an important part in the Sino-Japanese conflict in Shanghai, but some of them are not suitable for an aerial war in the future.

The reconnoitering planes in use are of type 14. They are equipped with a 450 h.p. motor and can cover nearly 200 kilometres an hour. They are armed with a machine-gun mounted behind the seat of the reconnoitering officer, so that he can defend the machine against enemy fire from behind. Their speed is considered too slow for satisfactory service in the future. There are also in use type 15 and type 90.

There are also a few large patrol planes of type 90. No. 1 of these is of metallic material, 21 metres long, 30 metres wide, 12 tons in weight, and is equipped with a number of motors producing 2,100 h.p. in all. Its maximum speed is 220 kilometres an hour. The No. 2 of type 90 is 20 metres long, 30 metres wide, 13 tons in weight, and equipped with motors producing 2,400 h.p. in all. Both of them are superior in capacity to the PN-12 of the American Navy, which has a speed of less than 200 kilometres.

Naval Promotion

Officers are promoted by selection, and candidates for special promotion are selected at the conference of the Admirals' Council.

The regular course of promotion for them is: Midshipmen, over one year's service on a training ship; 2nd Sub-Lieutenants, over one year's service; 1st Sub-Lieutenants, over 18 months' service including 6 months' service in Torpedo or Gunnery School. Lieutenants of over 4 years' service are promoted to Lieutenant-Commander.

Special service 1st Sub-Lieutenants, over two years' service; Special service 2nd Sub-Lieutenants, over three years' service. Special service Lieutenants (combatants, engineers and paymasters) may be promoted to Lieutenant-Commander by special appointment.

The qualifications for subsequent promotion are as follows:

Promotion	Minimum Service in Lower Rank
Commanders—Lieutenant-Commanders	2 years
Captains—Commanders	2 ,,
Rear-Admirals—Captains	2 ,,
Vice-Admirals—Rear-Admirals	2 ,,
Admirals—Vice-Admirals	Period determined by Imperial order subject to special merit

N. B. 1st class warrant or ranking officer of over 6 years in the service may be promoted to 1st Lieutenant or ranking officer.

Revision of the Military Service Law

The Law Amending the Military Service Law was promulgated on March 8, 1939. The items of revision include: amendments to the regulations on the term of military service; conscription of ex-service men; postponement of conscription for students and the manner of this conscription; abrogation of the short-term service system; and recognition of the privilege of postponement of conscription for Japanese students in Manchoukuo Government schools.

Revision of the Term of Service Both the development of the China Affair and the rapid change in the trend of international politics require that the Imperial forces be strengthened quickly through increases in the number of men in the services. To maintain sufficient forces, the term of service needs to be lengthened and the number of new conscripts must be increased.

Digitized by Google

Accordingly, under the new Law the term of the supplementary reserve service for the Army has been lengthened from 12 years and four months to 17 years and four months, while that of the first reserve service for the Navy has been prolonged from four years to five years and that of the second reserve service from five years to seven years.

Change in Method of Conscription of Young Men To meet the demand for a stronger national defence, a sizable increase in the number of conscripts is inevitable. The physical standard of soldiers must be upheld, if not raised, since the technical progress of and growing complications in modern armies require a high degree of strength and endurance in the individual soldier. Unfortunately, the physical condition of young men in Japan has tended to deteriorate in recent years, making it difficult to obtain the increased number of conscripts without adopting revisions in the old method of conscription. Therefore, necessary changes have been made in the method of selecting the young men at the physical examination for military service.

According to the old provisions pertaining to the physical standards of young men to be taken as conscripts, the minimum height of those fit for service, i.e. men who may be classed medically in Classes I and II, was fixed at 1.5 metres, and the active service men and the first supplementary untrained reservists were to be chosen from among the men with heights of 1.6 metres or above. The final selection was made by a drawing participated in by those whose height was 1.6 metres or above and who were classed medically as fit for the said service. All those who were lower in height, no matter what their other physical qualifications were, were exempted from the drawing and were enlisted as second supplementary untrained reservists.

In case the required number of those eligible for first-reserve service was unobtainable from those who measured 1.6 metres or above, the standard height was to be lowered by one millimetre at a time until the quota was filled. It may be seen that according to this method of lowering the standard height for eligibles before the final drawing took place, it was possible for a certain number of those under the standard height to be selected instead of those who measured 1.6 metres or above.

To prevent this, the new Law provides for a new method to be adopted wherein the supplementary eligibles are not allowed to draw lots with the originally eligible men measuring 1.6 metres or more.

Revised Method of Calling Ex-service Men for Training Ex-service men constitute the most valuable asset, as it were, for recruiting soldiers in time of war. Obviously, they must be called out for training regularly to be instructed in new kinds of drills in order to keep them competent as well-trained reservists. Only in this way will the Army and the Navy be able to mobilize first-class forces quickly in time of war. The following revisions have been made in the method of calling out ex-service men for periodical training.

1. According to old provisions, the duration of training for ex-service men was fixed at less than 35 days for the Army and less than 70 days for the Navy, while the latter could be increased up to 50 days when deemed necessary. The new regulation extends this lengthening privilege to the Army also in view of the necessity of drilling army ex-service men in the advanced and more complex technique of present-day military science.

2. Formerly, first supplementary untrained reservists only were called out for actual training. Now, second supplementary untrained reservists may also by called out for this purpose.

3. Formerly, when there was a shortage in forces even with the recalling of all those under leave of absence at the time of special need, such as the stationing of garrisons, only those ex-soldiers who were in the first year of their first-reserve service were summoned to cover the shortage. But the actual conditions on the Asiatic Continent are now such that a considerable number of soldiers must be stationed in different districts, and the number of ex-service men resident on the Continent is relatively small. It is considered that a time may come when the armies on the Continent supplemented only with recruits from the first-reserve service men in their first year of service will be altogether insufficient for garrisons or for other military purposes. To eliminate this danger, the new provisions empower the Army to call out when necessary all men in the first reserve list, regardless of the year of service they are in.

4. Conscripts may be found non-effective at the time of medical examination on their entrance to the barracks to which they are assigned, as a result of suffering disease or accident in the in-

Digitized by Google

terval between enrolment and the actual call to service. According to the old provisions, these men were exempted from service altogether. The revised provisions prescribe that "They shall be called to active service at a later date or year, or may be exempted from it." The proper application of this provision is left to the judgment of competent authorities.

Abrogation of the Short-term Service System The short-term service system for teachers in elementary schools is peculiar to Japanese conscription. The reason for the survival of this system through all former revisions in the military service law may be found in the fact that the Government was anxious not to weaken the teaching force in elementary schools by the absence of teachers from their duties even for purposes of national defence. The short-term system allowed these teachers to remain only five months in active service and this period was devoted to making them acquire a knowledge of military affairs so that they could accomplish their duty as educators of the people both in scientific and military subjects. The system worked well as a result of the complete understanding between the military and educational authorities.

But times have changed and the five-month service is now all too short to provide teachers with a comprehensive knowledge of military affairs to the extent that they may give proper instructions on military subjects in their schools. Simultaneously, their influence on pupils and communities will be greatly increased with a knowledge of military affairs acquired by entering the full service with other members of the nation or by going to the front when so destined. Under such considerations, the short-term service system has been abrogated entirely, although investigations are being made by competent authorities not to cause any material harm to the education of the younger generation by this sudden change.

Hitherto, those entitled to the short-term service entered the service without drawing lots or passing the conscription medical examination. Now, they are handled in the same manner as all other young men as regards physical standards and methods of selection. The number of conscripts taken from among elementary school teachers may be comparatively small. It is undeniable that the number of those who are thus taken will not be so large as might be expected because of the change in the regulations for conscripts taken from other sources whereby these will be unproportionately increased in the near future, while a large number of men in the reserve service may be trained in peace-time. Once taken into the defence services, these teacher-soldiers and -sailors will not only be trained much more thoroughly in military affairs than in the past but also many of them will be chosen as cadets, with the result that they will gain the military point of view and when they are released from active service they will achieve greater distinction in the eyes of their pupils in elementary schools and may accordingly achieve brilliant success in their chosen field.

Revisions in Postponement of Student Conscription The strength of an army is subject to the amount of mental vigour and physical strength of its soldiers. Both of these qualities are, as a rule, the possessions of young men with life before them. Therefore, conscripts should be chosen before they advance over the fixed age of twenty. But the medical examination and enrolment of students who reach the age of twenty has been postponed for as many years as they pursue their studies in schools and consequently many are much older than other young men at the time of their examination and enrolment, whereas their earlier enrolment is desirable since most of them may become important constituents of the army as reserve or non-commissioned officers.

The revised system, therefore, places a certain limit to the term of postponement, shortening it by an extent that will not deter their studies in schools, yet that will amend the irrationality which formerly arose by the application of rules under which they were conscripted according to certain fixed ages, regardless of the month of their birth or the number of years they needed to complete their respective studies. A comparison of the new and old regulations concerning the maximum years of age up to which conscription is postponed follows:

Universities, Medical Department	25	26

Furthermore, a new provision is added to the new system according to which all students in the above-mentioned schools may be conscripted in time of emergency even before the expiration of the term of postponement so that they may take part in the defence of their country.

These new rules will come into force from December 1, 1939. Those who are in schools on that day shall remain under the old rules so as not to interfere with their course of study.

Extension of Privilege of Postponement of Conscription to Japanese Students Abroad Japan is eager to assist Manchoukuo in her efforts to develop her national life and to give her all aid in such matters as educational enterprises which are most important in the mutual development of the two countries. Thus, the Japanese Government has extended the application of the system for the postponement of conscription for students to Japanese subjects studying in the government schools of Manchoukuo whose grades of study and school status are analogous to the above-mentioned schools in Japan.

CHAPTER VIII

PUBLIC FINANCE

Finance of the Showa Era

For the first six years of Showa, 1926–32, two Séiyukai and two Minséito (incarnation of Kenséikai) Cabinets came into power in turn. The former stood for a traditional inflation policy, while the latter for deflation policy. Financial retrenchment was carried out by the Minséito Cabinet and the gold embargo was lifted by the Hamaguchi Cabinet (Minséito) on January 11, 1930. Mr. Junnosuké Inoué, Finance Minister of that Cabinet, adopted a no-loan policy. A noteworthy financial retrenchment was carried out by Mr. Inoué in the 1930–31 fiscal year's budget and, in spite of a strenuous protest of the army and navy against the retrenchment, he was successful in effecting a saving of ¥35,063,000, of which ¥26,733,000 was the result of reduction of administrative expenses and ¥8,330,000 by the postponement of different enterprises.

The Inukai Cabinet that succeeded the Wakatsuki Cabinet on December 16, 1931, decided to adopt the budget drafted by the preceding Cabinet, due to lack of time to formulate a new one. However, the new Cabinet determined not to abolish the Overseas Ministry and other administrative organizations, which were decided on by the Wakatsuki Cabinet, but decided to carry out administrative readjustment. The sinking fund system was temporarily suspended and the deficient income was to be met by loans.

Expansion of National Budget

The first expansion of Japanese finance had come with the World War when it had passed the ¥1,000,000,000 mark and the next one came with the Manchurian incident, and in 1932 it approached the ¥2,000,000,000 mark. The increase of the national ways and means has continued since and the budget for 1937–38 reaches ¥2,815,000,000, an increase of ¥510,000,000 or 18 per cent as compared with the previous year.

The exchange rate of the yen has greatly fluctuated in these years. But even when the lowered value of the yen is taken into consideration the real increase in the national finance cannot be denied, while the rate of its per capita increase far exceeds that of population.

The per capita national wealth, national revenue and national expenditure have all increased greatly since 1912, the index numbers on the base of that year taken as 100 being 290.2 for national wealth in 1930, 289.7 for national revenue in 1934 and 293.3 for national expenditure in 1936, or the rate of their increase is almost on a par with each other.

Among the resources of national revenue the rate of increase of loans is much more ahead of those of taxes and others. The outstanding national loans which amounted to ¥2,570,000,000 at the end of 1912 increased to ¥9,850,000,000 at the end of 1935, or the per capita debt increased from ¥50 for Japan proper and ¥37 for the Empire in 1912 to ¥145 for Japan proper and ¥102 for the Empire in 1935. The amount of national revenue from taxes increased, but its proportion to the total revenue decreased and the per capita amount of taxes also decreased as compared with 1926 as given in the following table.

As to the finance of local governments its increase is still more rapid than that of the central government, its index number in 1935 being 555.65 against 371.71 for the latter as compared with 1912.

Note: For the detailed historical accounts of public finances up to the Taisho Era see previous numbers of the Japan Year Book.

Budget for the Fiscal Year 1938-39

General Features In the compilation of the Budget Estimates for the fiscal year 1938-39, comprising those of the General Account and Special Accounts, endeavours were made to increase as much as possible expenditures for the undertakings connected with the China incident, while at the same time, retrenchment was effected in other categories of expenditure. On the side of revenue, not only were tax increases of temporary nature made to apply the receipts to a part of the expenditure for the China incident, but a considerable growth in the tax and other receipts, arising from activity in the economic sphere, was also estimated. Deficits were to be covered by the proceeds of public loans.

The Budget Estimates approved by the Diet in the 73rd Session (December 1937 to March 1938) consisted of the original Budget and Supplementary Budgets Nos. 1, 2 and 3 for the General Account, and the original Budget and the Supplementary Budgets Nos. 1 and 2 for the Special Accounts. The sequence of the original Budget and the Supplementary Budgets for the General Account will be stated below:—

Digitized by Google

(1) The original Budget was as follows:

Revenue	¥
Ordinary	2,023,028,727
Extraordinary	844,768,128
Normal revenue	150,604,389
Receipts from the issue of public loans	694,163,739
Total	2,867,796,855
Expenditure	
Ordinary	1,640,536,301
Extraordinary	1,227,260,554
Total	2,867,796,855

(2) The Supplementary Budget No. 1 was as follows:

Revenue	¥
Ordinary	164,218,985
Extraordinary	222,273,345
Nomal revenue	149,231,510
Receipts from the issue of public loans	73,041,835
Total	386,492,330
Expenditure	
Ordinary	69,195,890
Extraordinary	317,296,440
Total	386,492,330

(3) The Supplementary Budget No. 2 was as follows:

Revenue	¥
Ordinary	15,671,723
Extraordinary	155,334,135
Normal revenue	1,515,112
Receipts from the issue of public loans	153,819,023
Total	171,005,858
Expenditure	
Ordinary	55,199,594
Extraordinary	115,806,264
Total	171,005,858

(4) The Supplementary Budget No. 3 was as follows:

Revenue	¥
Ordinary	842,343
Extraordinary	88,384,029
Normal revenue	1,346,546
Receipts from the issue of public loans	87,037,483
Total	89,226,372
Expenditure	
Ordinary	2,514,734
Extraordinary	86,711,638
Total	89,226,372

When these amounts are included, the total figures of the Budget Estimates for the General Account for the fiscal year 1938-39 were as follows:

Revenue	¥
Ordinary	2,203,761,778
Extraordinary	1,310,759,637
Normal Revenue	302,697,557
Receipts from the issue of public loans	1,008,062,080
Total	3,514,521,415
Expenditure	
Ordinary	1,767,446,519
Extraordinary	1,747,074,896
Total	3,514,521,415

Comparison of the Budget for 1938-39 with the Budget for 1937-38

General Account The following are the comparisons of the Budget for 1938-39 with the revised Budget for 1937-38:—

	1938-39	1937-38	Increase (+) or Decrease (−) compared with 1937-38
		(In yen)	
Revenue			
Ordinary	2,203,761,778	1,833,085,852	(+) 870,675,926
Extraordinary	1,310,759,637	1,081,841,527	(+) 228,918,110
Normal revenue	302,697,557	233,797,096	(+) 68,900,461
Receipts from the issue of public loans and borrowings	1,008,062,080	827,395,329	(+) 180,666,751
Transfer of surplus from the preceding year	0	20,649,102	(−) 20,649,102
Total	3,514,521,415	2,914,927,379	(+) 599,594,035
Expenditure			
Ordinary	1,767,446,519	1,528,781,338	(+) 238,665,181
Extraordinary	1,747,074,896	1,452,909,850	(+) 294,165,046
Total	3,514,521,415	2,981,691,188	(+) 532,830,227

Note:—For comparison with the Budget for 1938-39, certain adjustments were made in the Budget figures for 1937-38.

Special Accounts The Budget for the most important Special Accounts for 1938-39, and comparisons with the Budget for 1937-38 are as follows:—

Current Accounts of Revenue and Expenditure for 1938-39

(As outstanding on May 31, 1939)

According to the report of the Finance Ministry the revenue and expenditure of the General Account for the fiscal year 1938-39 stood on May 31, 1939, as follows:

	Amount	Increase as compared with May, 1938
	(Unit ¥1,000)	
Revenue,		
Ordinary	2,052,350	376,873
Extraordinary	1,252,256	459,131
Total	3,304,606	836,004
Expenditure		
Ordinary	1,597,127	188,385
Extraordinary	1,372,821	74,202
Toral	2,969,948	262,587

Increase of Revenue Increase of revenue from ordinary taxes amounted to ¥36,000,000 as compared with the similar figures in May, 1938 for the fiscal year 1937-38. Customs duties decreased by ¥18,000,000, and revenue from the land tax, the foreign bond special tax, the negotiable papers transfer tax, the gasoline tax, the tax on bourses, and tonnage dues also decreased. But, in all

Digitized by Google

other items it showed a remarkable increase, headed by ¥254,193,000 of the income tax.

Receipts from public undertakings and State property increased by ¥11,660,000, revenue from the Bank of Japan ¥3,432,000, and that from the special profits tax ¥83,470,000.

Revenue from all taxes amounted to ¥1,983,165,000, consisting of ¥1,689,726,000 from ordinary taxes and ¥293,439,000 from extraordinary taxes, resulting from the measures for the increase of revenue from taxes and natural increase of taxes on account of the industrial boom in the emergency.

Details of the revenue account follow:

	Amount	Increase or decrease (-) as compared with May, 1938

Note:—(1) The financial year begins on April 1st and ends on March 31st.
(2) The figures for 1935-36 and the years preceding it represent the settled accounts.
(3) * Represent the actual account on July 31, 1937.
(4) ‡ Represent the budget.
(5) The gross surplus indicates the balance of revenue over expenditure for each financial year. Under the Budget and Account Act the surplus actually created in each financial year is transferred to the Budget of the succeeding year, and this Gross

Digitized by Google

Surplus includes not only the accumulation brought forward from preceding financial years, but the net surplus actually created in that year. Accordingly, the balance of the gross and the net surplus represents a part or a total of the surplus created in the preceding year. Part of the gross surplus is applied to disbursements and deferred expenditures during the succeeding year and the balance is carried forward as a surplus to be used in succeeding financial years.

The National Loan Redemption Act as amended in 1915 required redemption of the national debt up to 1.16% of the amount outstanding at the commencement of the preceding financial year. The same Act was further amended in 1927 to require an additional appropriation for the same purpose of not less than 25% of the surplus actually created in the year before the preceding one. The same Act as amended in 1932, however, provides that the amount to be applied to redemption of the national debt shall, for the time being, be over one-third of 1.16% of the total debts outstanding at the commencement of the preceding financial year, and that the additional appropriation for the same purpose of not less than 25% of the surplus actually created in the year before the preceding one may be suspended.

(6) As fractions not exceeding 1 yen are omitted, the totals of the figures and the grand total do not correspond. This explanation is applicable to the following tables.

SPECIAL MILITARY EXPENSES

Revenue	4,605,000,000
Expenditure	4,605,000,000

Actual Amount of the 1939-40 Budget

According to the statement made by the Finance Ministry on May 25, 1939, the estimated revenue for the 1939-40 fiscal year is ¥8,380,738,000 and the estimated expenditure ¥8,123,621,000. These figures are obtained by deducting overlapping funds in the general account and in the special accounts (which there are 40 different kinds). When it is compared with the 1938-39 Budget the increase of revenue is ¥2,052,493,000 and that of expenditure ¥2,031,145,000. If the ¥4,605,000,000 for the special account for extraordinary military expenses and the special account for extraordinary military material purchasing funds, which was approved by the Diet, this year, without fixing the year of disbursement, is added to the above, as it may be expended in the current fiscal year, the total amount will reach ¥12,985,738,000 for revenue and ¥12,728,621,000 for expenditure, increasing ¥1,770,902,000 and ¥1,786,145,000 respectively over the similar figures for the 1938-39 Budget.

The process by which these figures are computed is outlined as follows in terms of ¥1,000:

	Revenue	Expenditure
General Account	4,804,543	4,804,543
Special Accounts	17,356,159	16,616,120
Total	22,160,702	21,420,664
Overlap deductions	5,097,026	4,614,105
Remainder	17,063,675	16,806,558
Further deductions;		
1. Transfer deductions (to special arms accounts)	4,586,690	4,586,690
2. Transfer deductions (payment to the extraordinary military account for materials, by other military special accounts)	1,051,549	1,051,549
3. Deduction of the Rice note redemption	2,997,669	2,997,669
4. Deduction of the Silk note redemption	47,027	47,027
Total deduction	8,682,937	8,682,937
Net total after all deductions	8,380,738	8,123,621

National Debts

Internal Loans Five per cent loan. This loan was issued mainly for the construction and improvement of the Imperial Railways, the compensation for and purchase of private railways, the colonization of Chösen, Taiwan, Karafuto and Kwantung Province, the relief of Japanese subjects suffering war

Digitized by Google

losses, rewards for distinguished services during the war in 1914–15, retiring allowances in connection with both the administrative readjustment and the reduction of armaments, compensation payments resulting from the reduction of the Army and Navy, the reconstruction works in Tokyo and Yokohama necessitated by the Earthquake disaster, compensation for loss sustained by the Bank of Japan in discounting Earthquake Bills, compensation for losses sustained in the accommodation extended to banking institutions in Taiwan and other undertakings and various grants. The total issue amounted to ¥2,239,377,375 of which ¥387,855,925 has already been redeemed, and ¥1,851,521,450 was still unredeemed at the end of March, 1938.

Five per cent loan ("Kō"). This loan was issued during 1908–09 for the purpose of meeting the purchase price of railways owned by seventeen private companies. The total issue amounted to ¥476,318,800, of which part has been redeemed, and ¥396,695,400 left unredeemed. The principal private railways in our country were purchased outright through the proceeds of this loan and were then unified into one State system.

Five per cent loan ("Onshi"). This loan, amounting to ¥30,000,000, was created at the time of the annexation of Chōsen by Imperial Ordinance No.327 of 1910, and the bonds were specially granted to the Korean peers and to public corporations of the Peninsula to provide funds for promoting industries and education and for famine relief.

Four per cent loan (1st and 2nd Series). In order to consolidate the national debt, the Government planned the conversion into low-interest loans of the outstanding five per cent domestic loans issued before 1905, and with this end in view issued in the home market with better results than had been anticipated two series of four per cent loans amounting to ¥100,000,000 each. As all the five per cent loan bonds previously issued were accepted in place of cash in subscriptions for the four per cent loans, such receipts amounted to ¥64,467,500 in the first issue of the four per cent loans and to ¥86,612,920 in the second. In addition to the total issue of ¥200,000,000 mentioned above, there was a loan of the first issue amounting to ¥76,220,500 which was delivered in place of cash to the bondholders of various five per cent loans.

Four per cent loan. In accordance with the provisions of Law No. 16 of 1933, the Government issued in December, 1933, a 4 per cent loan with a total face-value of ¥8,145,550. The object of the loan was to deliver to the Industrial Bank of Japan those loan bonds to be appropriated for the increase, arising out of the decline in the yen exchange, in the principal and interest charges of the Industrial Bank of Japan 5 per cent Sterling Debentures which were issued in 1908 for the purpose of making advances to the Korean Government for the development of enterprises in that country. Further issues were made to the amount of ¥65,180,675 in 1934, ¥9,368,875 in 1935 and ¥13,175 in 1936 for such purposes as the purchase of raw silk given as security in the case of accommodation of funds made by banks, the purchase of private railways, compensation payments to private railways and tramways, the purchase of private camphor manufacturing factories in Taiwan, and rewards for distinguished services in the Manchurian incident. The total issues from 1933 to 1936 thus amounted to ¥82,708,275 of which ¥3,325 was redeemed, and ¥82,704,900 remained outstanding at the end of the fiscal year 1937-38.

Three and a half per cent loan.

This loan was issued to the amount of ¥35,356,300 in 1936 and ¥21,584,550 in 1937 for such purposes as the purchase of raw silk given as security in the case of accommodation of funds made by banks, the development of public undertakings in Chosen, the purchase of private railways, and compensation payments to private railways and tramways, and rewards for distinguished services in the Manchurian incident. Of the total issues from 1936 to 1937 amounting to ¥56,940,850, ¥2,000 was redeemed and ¥56,938,850 remained outstanding at the end of the fiscal year 1937-38.

Four and a half per cent Exchequer Bonds. These bonds were issued in order to enable the Government to meet expenditures in connection with the Manchurian incident, the extension of the telegraph and telephone system, improvement of roads, reconstruction works necessitated by the Earthquake of 1923, construction and improvement of railways, various public undertakings in Chōsen, Taiwan, Kwantung Province and Karafuto, and the covering of revenue deficits in the General Account. The total issues from 1932 to March 1933 reached ¥715,000,000.

Four per cent Exchecquer Bonds. These bonds were issued for the first

Digitized by Google

time in 1933 for the same purpose as that of the four and a half per cent Exchequer Bonds mentioned above. The total amount of issue reached ¥3,070,-424,000 during the fiscal years 1933–34 to 1935–36.

Three and a half per cent Exchequer Bonds.

These bonds were issued to convert the 5 per cent. Exchequer Bonds, to defray the expenditure in connection with the Manchurian incident, to cover revenue deficits, to finance reconstruction works necessitated by the earthquake of 1923, to improve roads, to develop public undertakings in Chōsen, to construct and improve Government railways, to expand the postal, telegraph and telephone services, and to defray the expenditure for the China incident. The issues amounted to ¥2,-837,590,000 in the fiscal year 1936-37, and to ¥2,230,000,000 in the fiscal year 1937-38, giving a total of ¥5,067,590,000. Of this, ¥3,850 was redeemed and ¥5,067,-586,150 remained outstanding at the end of the fiscal year 1937-38.

External Loans Four per cent Sterling Loan of 1899 (1st Series). For the purpose of meeting the expenditures required for the construction of railways, improvement of the existing Government railways, construction of railways in the Hokkaido, steel manufacture, and extension of the telephone system, and in accordance with the provisions of the Railway Construction Law (Law No. 4, 1892), the Public Undertakings Loan Regulations (Law No. 59, 1896), the Hokkaido Railway Construction Law (Law No. 93, 1896), and Law No. 101, 1899, the Government issued in London in June, 1899, a loan of £10,000,000 at an issue-price of £90 per £100 face-value, the principal of which is, after being left unpaid for ten years from January, 1899, to be redeemed at the option of the Government by means of drawings in forty-five years.

Five per cent Sterling Loan of 1907. For the purpose of consolidating and redeeming the six per cent Sterling Loan of £22,000,000 issued in 1904, the Government raised in March, 1907, a five per cent Loan of £23,000,000 in London and Paris in accordance with the provisions of Law No. 1 of 1904, Law No. 12 of 1905, and Imperial Ordinance No. 23 of 1907. Its issue-price was £99 10s. per £100 face-value, and the principal is to be left unpaid until March 11, 1922 and thereafter to be redeemed at the option of the Government by means of drawings by March 12, 1937. The proceeds of this loan were applied to the redemption of the six per cent Sterling Loan of £22,000,-000.

Four per cent Franc Loan of 1910. The four per cent Franc Loan was issued in Paris in 1910 with the same object as the four per cent Loan issued at home; a portion of its proceeds was appropriated for use as fund for the redemption of domestic loan bonds which were exported abroad, and another portion for use as fund for the redemption of the five per cent loan bonds in circulation at home. The amount of issue was 450,000,000 francs, the rate of interest four per cent, payable on the 15th of May and November every year; the issue-price was 95 francs 50 centimes, and the loan to remain unredeemed for ten years, after which it is to be redeemed within fifty years.

Four per cent Sterling Loan of 1910 (3rd Series). The four per cent Sterling Loan of 1910 was raised for the same purpose as the four per cent loan raised at home and the four per cent Franc Loan of 1910 raised in France, and was employed as fund for the redemption of the indorsed War and five per cent Loans in circulation in London. The amount of issue was £11,000,000, the rate of interest four per cent, payable on the 1st of June and December, the issue-price was £95, and the loan to remain unredeemed for ten years, after which it is to be redeemed within fifty years; and as the object of the loan was the redemption of the indorsed loans above referred to, the latter loan bonds were accepted in place of cash when the former loan was subscribed for.

South Manchuria Railway Sterling Debentures. The South Manchuria Railway Sterling Debentures of 1911 with a total face-value of £6,000,000, the liability for the service of which had been assumed by the Government, fell due on January 1, 1936, and consequently, the greater part of the Debentures was redeemed in cash, while a part was repaid by conversion into domestic loan. The Government has been further authorised by Law No. 34 of 1933 to subscribe to the shares of the Company, and instead of paying cash for the shares, to assume liability for the service of the Sterling Debentures with a total face-value of £4,000,000 issued in 1933 by the Company. Thus, the amount outstanding at the end of March, 1938 was £4,000,000.

Six and a half per cent Gold Bonds of 1924. Partly, for the purpose of redeeming the outstanding Imperial Japanese Government 4½% Sterling Loan of the first and second series, which fell

Digitized by Google

due January 15, 1925, and July 10, 1925, respectively and, partly for the purpose of purchasing materials and supplies for reconstruction necessitated by the earthquake and fire of September, 1923, loans with a total face value of 150,000,000 dollars were issued in New York in February, 1924, in accordance with Art. 1 of Law No. 56, 1923 and Art. V of Law No. 6, 1906. The issue-price was 92½ dollars per 100 dollars face-value and the loan is to remain unredeemed for fifteen years, after which it is to be redeemed within fifteen years, namely, by February 1, 1954.

Six per cent Sterling Loan of 1924. Loans with a total face-value of £25,000,000 were issued in London in February, 1924, in accordance with Art. 1 of Law No. 56 promulgated in 1923 and Art. V Law No. 6, in 1906, for the same purpose as the 6½% Loan of 1924 issued in the United States of America. The issue-price was £87½ per £100 face-value and the loan is to remain unredeemed for fifteen years, after which it is to be redeemed within twenty years, namely, by July 10, 1959.

Five and a half per cent Sterling Loan of 1930. For the conversion of the 4% Sterling Loan of 1905, the Government issued a 5½ per cent Sterling Loan of £12,500,000 in London in May, 1930 in accordance with the provisions of Law No. 6 of 1906. The issue-price was £90 per £100 face-value. The principal is to be left unpaid for ten years, after which it is to be redeemed by May 1, 1965.

Five and a half per cent Gold Bonds of 1930. For the conversion of the 4% Sterling Loan of 1905, loans with a total face-value of $71,000,000, were issued in New York in May, 1930 in accordance with Law No. 6 of 1906. The issue-price was $90 per $100 face-value. The loan is to remain unredeemed for ten years, after which it is to be redeemd by May 1, 1965.

State Property

(1) The Legal Definition and Categories of State Property.

State Property mentioned above is defined under Article 1 of the State Property Law, promulgated by Law No. 43 in April, 1921 as follows:

"The State Property under this Law includes all the State-owned real estate and such movable estate and rights belonging to the State as provided in the Imperial Ordinance."

Article 1 of the Imperial Ordinance No. 15 concerning the State Property Law defines, however, State movable estate and rights that are State Property in the following manner:

"The following State-owned movable estate and rights are to be State Property as provided in Article 1 of the State Property Law:

(a) Ships, floats, floating piers and floating docks.

(b) Appendages of real estate or movable estate given in (a).

(c) Machine and important equipment in Government factories such as iron works, shipbuilding yards, arsenals, the mint, tobacco mills and railways.

(d) Surface rights, servitudes, mining rights, alluvial mineral rights and other rights similar to these rights.

(e) Rights relating to stocks and investments.

The scope of the term "factory" under (c) above is to be determined by the respective Ministers after consultation with the Minister of Finance."

State-owned movable estate and rights, such as, cash, deposits, loans, common fixtures and books, for instance, not

Digitized by Google

mentioned in the above provisions are therefore State Property in substance, but do not come under the provisions of this Law.

Article 2 of the State Property Law divides State Property into four classes, namely, Public Property, Official Property, Property used for Forestry Management and Miscellaneous Property. Public Property is that directly used or to be used for public service by the State; Official Property is that used or to be used, by the State, for Shinto Shrines, or for State service and enterprises or for residences of officials and other personnel; Property used for Forestry Management is that used or to be used, by the State, for the management of forests, while Miscellaneous Property is that not belonging to these three categories.

(2) The Legal Limitation of the Content of the "State Property Account" and its Categories.

Article 26 of the State Property Law requires the Government to make a yearly statement of the increase or decrease in the State Property, and, every fifth year, to issue a comprehensive report covering the entire property for the period; and both these statements are to undergo examination by the Auditing Board and then to be presented to the Imperial Diet.

The following are, however, excluded from the statements :—

(a) Movable estate and rights owned by the State; but not subject to the provisions of the Imperial Ordinance, that is, State Property in reality if not in law (Art. 1, State Property Law; Art. 1, Imperial Ordinance concerning the State Property Law).

(b) Public Property (Art. 28, State Property Law).

(c) The value of lands used for religious purposes by Buddhist temples, the public land of public corporations and of sites of Shinto shrines (Art. 2 and 5, Ordinance No. 14, Department of Finance).

The figures given in the following table are based on these official statements of State Property, and accordingly, the total value of the property owned by the Imperial Japanese Government including State Property mentioned in (a)—(c) above will be much higher than the figures given in this table. It should be noted that the Government, recognizing that it was expedient to apply the State Property Law to Chosen, Taiwan, Karafuto, Kwantung Province, and Nanyo (Mandated Territory in the North Pacific), put this Law into effect as from April 1, 1937, and the property in these regions was included in the Statements of the financial year 1937. Further, as there prevails an opinion that the value and volume of property mentioned in (b) and (c) should be given in the statements, they will be included therein in the near future.

(3) Administration of State Property.

The administrative service over State Property includes both direct management and general administration, the former under the direction of the respective Departments, the latter under the Minister of Finance. Each Minister administers the State Property of his Department; but the Minister of Finance also undertakes, as the competent Minister, the general management of all the Property and, thus, unifies the direct management by each Minister, keeping one in touch with the other, so as to secure the full use of the Property.

(4) Increase or Decrease in State Property.

The increase in the total value of State Property is attributed to such factors as the purchase, expropriation and contribution of property, construction of buildings and ships, and the acquisition of rights (acquisition of real estate without owner, acquisition of stocks and of rights due to investment, establishment of surface rights, etc.), while the decrease in property is due to the sale, conveyance without compensation, exchange and collapse of property, and extinction of rights (extinctive prescription, reduction of capital, etc.). Moreover, the re-valuation of property made every fifth year causes an increase or decrease in the total value of State Property.

(5) The Funds from the Adjustment of State Property.

With the exception of receipts coming under other special accounts and those from the disposition of State forests and plains or of uncultivated places in the Hokkaidō, the receipts from the adjustment and disposition of State Property and other miscellaneous receipts constitute the Funds from the Adjustment of State Property and the revenue and expenditure are segregated in a Special Account.

These funds are transferred to the General Account and then, in addition to being used for building and repair and other expenditure necessary for the adjustment of State Property, are, in case of necessity, used for purposes other than those mentioned above in accordance with the Budget Estimates (Articles 1—4, Special Account Law for Funds from the Adjustment of State

Digitized by Google

Property by Law No. 6, 1922; Exceptions in the Special Account Law for Funds from the Adjustment of State Property by Law No. 15, 1927).

The following are the statistics of revenue and expenditure in the Funds from the Adjustment of State Property for the financial years 1928-29 to 1938-39:

Financial Years	Revenue	Expenditure
	(In yen)	
1928-29	11,373,386	15,913,470
1929-30	9,349,573	9,102,751
1930-31	6,439,664	6,237,805
1931-32	4,870,211	5,963,898
1932-33	4,755,566	5,823,635
1933-34	5,973,512	6,198,998
1934-35	7,523,004	6,786,056
1935-36	6,812,346	3,470,679
1936-37	8,459,373	5,269,417
1937-38	7,994,559	4,528,542
1938-39	6,120,854	2,160,934

Note:—The figures for the financial years 1928-29 to 1937-38 represent the settled accounts, but those for 1938-39 and 1937-38 the budget estimates.

Note:—

(1) The figures for 1928 to 1931 were computed by adding the increase in the value of State property in each financial year to the appraised value of 1933.

(2) The following are excluded from this table: (a) State movable estate and rights not provided in the of Shinto shrines, and (d) public land of public corporations.

(3) As from April 1, 1937, the State Property Law was also put into operation in Chosen, Taiwan, Karafuto, Kwantung Province, and the Mandated South Ses Islands.

Appendix—The value of State Property under the jurisdiction of our colonial Governments on March 31, 1936 is as follows:

Digitized by Google

Government of Chōsen	¥ 664,179,205
Government of Taiwan	312,433,468
Government of Karafuto	50,726,345
Government of Kwantung	158,010,446
Government of Nanyo (Mandated South Sea Islands)	20,343,824
Total	1,205,693,288

Note:—This table indicates only the value of State-owned real estate and ships and their equipment, but excludes the value of Public Property.

Deposit Funds Management Bureau of the Department of Finance[1]

Organization of the Deposit Funds Management Bureau Although the Deposit Funds have been in existence since 1877, it was only after many changes that the present system was established in 1925. The chief of the Deposit Funds Management Bureau is under the control and supervision of the Minister of Finance and he is responsible for its activities and efficiency. Its finances are segregated in a Special Account and the Bureau is given control over the expenditure of its entire revenue. The chief business of the Bureau is not merely confined to the control of deposits, but also includes the investment and management of other funds. The deosits, which are made according to laws and ordinances, consist, for the most part, of postal savings deposits received by the Government; but the Deposit Funds also include other deposits, reserves in the Special Account of the Deposit Funds and surpluses. It may specially be noted that the total of the Deposit Funds reached 5,492 million yen on March 31, 1938, this representing some ½ of the total deposits in ordinary banks throughout the country. All business connected with receipt and payment of cash is transacted on behalf of the Bureau by the Bank of Japan in accordance with instructions from the Minister of Finance.

Investment of the Deposit Funds It is laid down by law that the Deposit Funds are to be invested solely for the benefit of the State and the public in profitable and safe manner, and that such investments are to be made only after investigation of their purposes and methods in consultation with the Committee on Investments of the Deposit Funds. The following is an explanation of the nature of the Committee and the methods it employs.

Committee on Investments of the Deposit Funds This Committee consists of the following members: The Minister of Finance, as a chairman, the Parliamental Vice-Minister of Finance, high officials of the Government Offices concerned, one of the Chief Auditors of the Auditing Board, the Governor of the Bank of Japan and other learned and experienced persons. The number of full members is not to exceed fifteen; but in order to meet special needs, temporary members may be appointed. The Committee is placed under the supervision of the Minister of Finance, and its function is to answer the question of the Minister, after both investigation and study of matters relating to the investment of the Deposit Funds. At the beginning of every fiscal year, the Minister of Finance is to draw up the necessary plan to govern the investment of the funds to submit it to this Committee, and the same process is to be undertaken should there be any occasion to supplement or to change this plan. In addition to answering the question of the Minister of Finance the Committee may send his proposals concerning the investment of the Deposit Funds. The Minister should present to the Committee, after every fiscal year, a report stating particulars of important matters concerning conditions of investment of the Deposit Funds and changes in the funds invested.

Method of Investment As mentioned above, the Deposit Funds are to be invested for the benefit of the State and the public welfare in a profitable and safe manner. Consequently, in con-

1. Note: This name of the Bureau is newly given to the "Deposits Bureau" formerly mentioned in this Year Book.

Digitized by Google

formity with this principle, the investment of funds is to be limited to the following items:

(a) The subscription to, underwriting or purchasing of national loans or making of loans to the General or Special Accounts of the Government.

(b) The subscription to, underwriting or purchasing of local loans, irrigation associations' loans or health insurance associations' loans, or making of loans to local public corporations, irrigation associations or health insurance associations.

(c) The subscription to, underwriting or purchasing of bonds issued by corporations organized under special laws or making of loans redeemable within a period not exceeding three years to these corporations.

(d) Loans to banks organized under special laws but not authorized to issue debentures.

(e) The subscription to and purchasing of foreign Government bonds.

(f) Deposits with the Bank of Japan to be held abroad for designated purposes.

These items only indicate the method of the investment of the funds and the question whether any particular investment is for the promotion of the benefit of the State or public welfare or whether it is profitable and safe is left to the joint consideration and decision of the Minister of Finance and this Committee.

The investment of the Deposit Funds is determined, within the limits mentioned above, at the beginning of every fiscal year. The Deposit Funds Management Bureau gives, at the end of March, 1938, the following figures of investment, classified according to purposes:

Items	(In thousands of yen)	%
National loans	2,796,045	50.91
Loans to the General and Special Accounts	81,409	1.48
Local funds invested	2,050,396	37.33
Loans to the special banks and companies	144,214	2.63
Special advances	192,099	3.50
Foreign Government bonds	75,439	1.37
Funds held abroad	1,016	0.02
Cash	123,406	2.25
Others	28,264	0.51
Total	5,492,288	100.00

Local funds representing the funds to be invested for the benefit of local districts to local public corporations, various associations and individuals are advanced from the Deposit Funds Management Bureau to the borrowers either directly or through special banks and similar institutions. These funds are alloted for the following purposes:—

1. Advances to be generally made every year for:

(a) Public utility undertakings of public corporations such as water supply works, prevention of disasters, sanitary arrangements, improvement of roads, rivers and harbours, road making and construction of bridges, reclamation works, construction of schoolhouses and teachers' dwelling-houses, electric and gas enterprises, and tramway, local railway and car enterprises.

(b) Social works such as housing reform and the establishment of public markets, public pawnshops, day nurseries and intelligence offices and others.

(c) Enterprises by various associations such as land adjustment associations, industrial associations, forestry associations, fishery associations, live-stock breeding associations, manufacturers' associations and commercial associations and those by federations of these associations.

2. Advances to be made for urgent needs:

Repair works of disasters, reconstruction works necessitated by the earthquake, accommodation to the silk-raising industry, the relief of the unemployed, and accommodation to middle and lower class merchants, manufacturers and farmers.

3. Advances to be made for:

Such institutions as public corporations and various associations in our colonies.

With regard to the rate of interest paid on the deposit it is to be noted that the rate was reduced as from April 1, 1937 to 2.76 per cent per annum for the greater part of postal savings. The postal savings amount to some 71 per cent of the total amount of the Doposit Funds, and details are given in the Statement of the Deposit Funds (Table No. 91). Other deposits are divided into two classes, namely, fixed deposits and ordinary deposits. The rate of interest on fixed deposits is in principle 2.5 per cent per annum, but the rate on deposits of such character that the depositing of cash is confined by laws and ordinances to the Deposit Funds Management Bureau is 3 per cent. The rate on ordinary deposits is in principle 0.75 per cent per annum, while that on deposits of such character that the depositing of cash is confined by laws and ordinances to the Deposit Funds Management Bureau is 1 per cent. The rates on fixed deposits have been effec-

Digitized by Google

tive since July 1, 1936 and those on ordinary deposits since April 1 of the same year. Turning to the rates for the advances made by the Deposit Fund Management Bureau, it will be found that those for the advances to prefectures, large cities, and local corporations remain, for the most part, at 3.2 per cent per annum. As to the advances made through banks and similar institutions, the intermediate institutions gain 0.7 per cent and actual borrowers must pay at the rate of 3.9 per cent.

3. Plans approved in 1937.

Plans for the investment of funds to the amount of ¥851,533,000 were made in the fiscal year 1937. Of these, items involving more than 5 million yen each are as follows:—

	(In yen)
(a) Funds for taking up national loans to be issued in 1937, and for purchases of loan bonds	500,000,000
(b) Loans to public corporations for their adjustment of arable land and to various associations for their undertakings	74,700,000
(c) Emergency loans for the relief of unemployment	10,000,000
(d) Loans for city planning	5,000,000
(e) Loans for repair works following disasters of 1934 and 1935	15,000,000
(f) Loans for the economic development of agricultural villages in depressed conditions	6,750,000
(g) Loans to the medium and smaller merchants and manufacturers	10,000,000
(h) Loans for drainage works in Chōsen	5,000,000
(i) Funds for taking up the national bonds of Manchoukuo	20,000,000
(j) Loans to public corporations and corporations or associations on a non-commercial basis within the limits of the deposits with the Deposit Funds as received from the Post Office Life Insurance of Chōsen	17,100,000
(k) Loans for the adjustment of debts in agricultual villages	20,000,000
(l) Loans for the creation and maintenance of independent farmers	10,000,000
(m) Loans for repair works following disasters of 1937	12,000,000
(n) Loans for the re-inauguration of businesses by Japanese residents in China	20,000,000
(o) Emergency loans for the silk-raising industry, the storage of rice, the purchase of fertilizers, and the storage of unhulled rice	80,000,000

It should specially be noted that in addition to the above-mentioned items of accommodation considerable short-term loans have recently been made for the expansion of productive capacity and the easing of the monetary position. Such amounts have sometimes reached 260 million yen.

Japan's National Wealth

The national wealth of Japan proper for 1930, the most recent date for this kind of investigation, was estimated at ¥110,188,000,000, according to the Cabinet Statistics Bureau. This included the following :

	(Estimates in thousands of yen)
Land	41,091,348
Mines	6,499,651
Ports, harbours and canals	343,143
Bridges	483,000
Trees	6,706,815
Live-stock and poultry	346,356
Buildings	22,843,300
Industrial machines and apparatus	1,809,381
Railways and tramways (street cars)	3,598,138
Vehicles and aeroplanes	660,294
Shipping	2,060,236
Electric and gas supply equipment	1,905,044

Digitized by Google

		(Estimates in thousands of yen)
Telegraph and telephone equipment		196,102
Waterworks equipment		352,779
Property in store:		18,847,310
Household property	12,473,201	
Manufactures	5,457,466	
Coins and gold and silver bullion	916,643	
Miscellaneous		2,250,515
Balance of Japan's foreign credit and debt		191,592
Total		110,188,004

The total is classified into Government property 12 per cent, public property 4 per cent and private property 84 per cent. Land, buildings, trees and mines combined make a total of 81 per cent in all. Manufactured goods, railways and tramways, shipping, electric and gas equipment and industrial machines and tools combined make a total of 13 per cent. The remainder is 6 per cent. The national wealth for 1930 per household was ¥8,672 and per capita was ¥1,710. The change of national wealth, investigated by Mr. Hideomi Takahashi, a statistical authority in Japan, follows :

Time of	Year	National wealth (in millions of yen)
Arrival of "Black Ships"	1851	5,085
Sakuradamon Murder Incident	1860	5,769
Meiji Restoration	1868	6,818
Abolition of feudal clans and establishment of prefectural government	1873	7,317
Satsuma Rebellion	1877	8,571
Promulgation of Imperial Constitution	1889	13,043
Sino-Japanese War	1894	16,667
Russo-Japanese War	1904	22,742
First Year of Taisho Era	1912	37,524
	1921	93,026
June,	1924	101,978
March,	1925	105,742

Public Finance in 1937-38

As has been stated in the Japan Year Book, 1938-39, the Budget for the fiscal year 1937-38, with the Supplementary Budget No. 1, passed the Diet in the 70th Session (December 1936 to March 1937). In view, however, of the outbreak of the China incident and subsequent developments of the situation, the Government submitted the Supplementary Budgets Nos. 1, 2, 3 and 4 to the Diet in the 71st Session (July to August 1937), specially convoked for the purpose, and secured its approval. In September, 1937, the Diet was again specially convoked, and not only was the Supplementary Budget No. 1 approved in this 72nd Session, but also the Special Account for Emergency Military Expenditure was created. When including the Supplementary Budgets Nos. 1 and 2 that passed the Diet in the 73rd Session (December 1937 to March 1938), the total figures for the Budget for the General Account for the fiscal year 1937-38 were as follows:—

(In this Budget, however, there is not included an amount of ¥507,208,270 which has been transferred to the Special Account for Emergency Military Expenditure).

Revenue	(In yen)
Ordinary	1,833,085,852
Extraordinary	1,081,841,527
Normal Revenue	233,797,096
Receipts from the Issue of Public Loans	827,395,329
Transfer of Surplus from the Preceding Year	20,649,102
Total	2,914,927,379
Expenditure	
Ordinary	1,528,781,338
Extraordinary	1,452,909,850
Total	2,981,691,188

When classifying the above Budget figures into the original Budget and the Supplementary Budgets, the following figures will be given:—

Revenue	(In yen)
Original Budget approved in the 70th Session	2,813,937,971
Supplementary Bndgets	100,989,408
Approved in the 70th Session No. 1	58,197,902
Approved in the 71st Session No. 1	1,625,136
No. 2	13,389,749
No. 3	7,317,570
No. 4	7,611,290
Approved in the 72nd Session: No. 1	6,651,919
Approved in the 73rd Session: No. 1	0
No. 2	6,195,842
Total	2,914,927,379
Expenditure	
Original Budget approved in the 70th Session	2,813,937,971
Supplementary Budgets	167,753,217
Approved in the 70th Session: No. 1	58,197,902

Japan's National Wealth

The national wealth of Japan proper for 1930, the most recent date for this kind of investigation, was estimated at ¥110,188,000,000, according to the Cabinet Statistics Bureau. This included the following :

	(Estimates in thousands of yen)
Land	41,091,348
Mines	6,499,651
Ports, harbours and canals	343,143
Bridges	483,000
Trees	6,706,815
Live-stock and poultry	346,356
Buildings	22,843,300
Industrial machines and apparatus	1,809,381
Railways and tramways (street cars)	3,598,138
Vehicles and aeroplanes	660,294
Shipping	2,060,236
Electric and gas supply equipment	1,905,044

Digitized by Google

	(Estimates in thousands of yen)	
Telegraph and telephone equipment		196,102
Waterworks equipment		352,779
Property in store:		18,847,310
Household property	12,473,201	
Manufactures	5,457,466	
Coins and gold and silver bullion	916,643	
Miscellaneous		2,250,515
Balance of Japan's foreign credit and debt		191,592
Total		110,188,004

The total is classified into Government property 12 per cent, public property 4 per cent and private property 84 per cent. Land, buildings, trees and mines combined make a total of 81 per cent in all. Manufactured goods, railways and tramways, shipping, electric and gas equipment and industrial machines and tools combined make a total of 13 per cent. The remainder is 6 per cent. The national wealth for 1930 per household was ¥8,672 and per capita was ¥1,710. The change of national wealth, investigated by Mr. Hideomi Takahashi, a statistical authority in Japan, follows:

Time of	Year	National wealth (in millions of yen)
Arrival of "Black Ships"	1851	5,085
Sakuradamon Murder Incident	1860	5,769
Meiji Restoration	1868	6,818
Abolition of feudal clans and establishment of prefectural government	1873	7,317
Satsuma Rebellion	1877	8,571
Promulgation of Imperial Constitution	1889	13,043
Sino-Japanese War	1894	16,667
Russo-Japanese War	1904	22,742
First Year of Taisho Era	1912	37,524
	1921	93,026
June,	1924	101,978
March,	1925	105,742

Public Finance in 1937-38

As has been stated in the Japan Year Book, 1938-39, the Budget for the fiscal year 1937-38, with the Supplementary Budget No. 1, passed the Diet in the 70th Session (December 1936 to March 1937). In view, however, of the outbreak of the China incident and subsequent developments of the situation, the Government submitted the Supplementary Budgets Nos. 1, 2, 3 and 4 to the Diet in the 71st Session (July to August 1937), specially convoked for the purpose, and secured its approval. In September, 1937, the Diet was again specially convoked, and not only was the Supplementary Budget No. 1 approved in this 72nd Session, but also the Special Account for Emergency Military Expenditure was created. When including the Supplementary Budgets Nos. 1 and 2 that passed the Diet in the 73rd Session (December 1937 to March 1938), the total figures for the Budget for the General Account for the fiscal year 1937-38 were as follows:—

(In this Budget, however, there is not included an amount of ¥507,208,270 which has been transferred to the Special Account for Emergency Military Expenditure).

Revenue	(In yen)
Ordinary	1,833,085,852
Extraordinary	1,081,841,527
Normal Revenue	233,797,096
Receipts from the Issue of Public Loans	827,395,329
Transfer of Surplus from the Preceding Year	20,649,102
Total	2,914,927,379
Expenditure	
Ordinary	1,528,781,338
Extraordinary	1,452,909,850
Total	2,981,691,188

When classifying the above Budget figures into the original Budget and the Supplementary Budgets, the following figures will be given:—

Revenue	(In yen)
Original Budget approved in the 70th Session	2,813,937,971
Supplementary Bndgets	100,989,408
Approved in the 70th Session	
No. 1	58,197,902
Approved in the 71st Session	
No. 1	1,625,136
No. 2	13,389,749
No. 3	7,317,570
No. 4	7,611,290
Approved in the 72nd Session:	
No. 1	6,651,919
Approved in the 73rd Session:	
No. 1	0
No. 2	6,195,842
Total	2,914,927,379
Expenditure	
Original Budget approved in the 70th Session	2,813,937,971
Supplementary Budgets	167,753,217
Approved in the 70th Session:	
No. 1	58,197,902

a corporation which, though not having a head office or principal business office within the territory where this Law is in force, has capital within the territory where this Law is in force is made in the same manner as mentioned above.

The tax rate is 0.1%. When, however, the tax calculated is less than ₹10, it is levied at the rate of ₹10 a year. Corporations without any income are exempted from the imposition of the tax. (For the temporary increase in the tax rate, see the Law relating to Emergency Taxes for the China Incident).

4. Corporations exempted from the Tax.

Corporations on the non-commercial basis, which are exempted from the imposition of the income tax in accordance with the Income Tax Law and other laws, are exempted from the Tax on the Capital of Corporations.

Special Tax on Foreign Currency Securities

The Law relating to this tax was promulgated by Law No. 5 of 1937, and put into effect as from April 1 of the same year. The important points of the Law are summarized as follows:

1. Tax Payers.

Holders of foreign currency securities, who have domicile or a temporary residence for one year or more within the territory where this Law is in force, are liable for payment of this tax. "Foreign currency securities" here means Japanese national bonds, Japanese municipal bonds, and debentures issued by Japanese corporations, all expressed in foreign currencies.

2. Basis of Assessment.

The tax is levied on interest on foreign currency securities. Interest received between January 1 and June 30, and that received between July 1 and December 31, are taken as the assessable amount.

3. Tax Rates.

(a) In the case of interest on national bonds in foreign currencies:

7/10 of the amount remaining after deduction of the amount equivalent to 5% (a year) of the face-value.

(b) In the case of interest on foreign currency securities other than national bonds in foreign currencies:

7/10 of the amount remaining after deduction of the amount equivalent to 5.5% (a year) of the face-value.

4. Tax Exemption.

The following interest is exempted from the imposition of the tax:—

(a) Interest on foreign currency securities as received by holders who are exempted from the Class II income tax under the Income Tax Law and other laws.

(b) Interest on foreign currency securities held outside the Japanese Empire including Kwantung Province and Nanyo (Mandated territory in the Pacific).

(c) Interest on national bonds in foreign currencies with interest rates not exceeding 5% a year.

(d) Interest on foreign currency securities (other than national bonds in foreign currencies) with interest rates not exceeding 5.5% a year.

(e) Interest on foreign currency securities issued under the contract that the issuer of the securities will pay the tax; provided, however, that such contract must be that concluded before January 1, 1937.

Gasoline Tax

The Law relating to this tax was promulgated by Law No. 6 of 1937, and put into operation as from April 1 of the same year. The important points of the Law are summarised as follows:

1. Taxable Article.

The tax is levied on gasoline (mineral oil, the specific gravity of which is not exceeding 0.8017 at 15° C.), except in the case of gasoline manufactured from coal, lignite, oil shale, or natural gas.

2. Tax Rate.

₹13.2 per kilolitre.

3. Collection of Tax.

The gasoline tax is collected, at the time gasoline is delivered from the factories or bonded areas, from persons who take delivery of the gasoline; provided, however, that in the event of the security equivalent to the tax being offered in accordance with the provisions of Ordinance, the collection of such tax may be postponed for a period not exceeding two months.

Tax on the Transfer of Securities

The Law relating to this tax was promulgated by Law No. 7 of 1937, and put into effect as from April 1 of the same year. The important points of the Law are summarised as follows:—

1. Scope of Taxation.

The tax is imposed in respect of the transfer of securities made in the form of purchase and sale, exchange, presentation, legacy, and other acts. "Securities" here means national bonds, local government bonds, company debentures, debentures of the Central Chest for Industrial Associations, debentures of the Central Chest for Commercial and Industrial Associations and shares, and the securities of similar nature issued by

Digitized by Google

foreign governments or foreign corporations.

2. Tax Payers.

The tax is imposed on persons who have acquired the securities.

3. Tax Rate.

The tax is levied at the rate of 1/10,000 to 8/10,000 of the value of acquisition. In the case of the transfer of securities by purchase and sale, the value of acquisition represents the price of purchases and sales, and in the case of the transfer by other acts, it represents the price at the time when such transfer has been made.

4. Persons exempted from the Tax.

Corporations on the non-commercial basis, which are exempted from the income tax in accordance with the Income Tax Law and other laws, are exempted from the imposition of the tax.

5. Securities exempted from the Tax.

(a) Government securities redeemable within a period not exceeding one year.

(b) Local bonds, hypothec debentures, and debentures with a face-value of not more than ¥20 as specified by Ordinance.

6. Cases where, though Transfers are made, the Tax is exempted.

No tax is levied in such cases as the transfer of securities arising from inheritance, the merger of corporations, or from the transfer of all insurance contracts concluded under the provisions of Article 13, (5) of the Insurance Business Law, the transfer of national bonds in cases in which one of the parties to purchases and sales is the Bank of Japan, and transfers by other acts.

Law Relating to Emergency Taxes for the China Incident

It was immediately after the outbreak of the North China incident that the Law relating to Emergency Taxes for the North China Incident, effective for a period of one year, was promulgated for the purpose of increasing tax receipts by some 100 million yen. Subsequent developments of the incident, however, necessitated a further increase in taxation, and the Law relating to Emergency Taxes for the North China Incident was replaced by the Law relating to Emergency Taxes for the China Incident, newly enacted for the purpose by Law No. 51 of 1938. This, together with the increase of the Special Profits Tax, aims at a growth of some 300 million yen in tax receipts. By this Law not only were the rates increased in the Income Tax, the Tax on the Capital of Corporations, the Sugar Excise, and the Tax on Bourses, but also the Tax on Dividends, the Tax on Interest on National Bonds and Company Debentures, the Travelling Tax, the Admission Tax, the Special Admission Tax, and the Tax on Commodities were newly created. It should, however, be noted that the above mentioned Tax on Dividends, Tax on Interest on National Bonds and Company Debentures, and Tax on Commodities are the continuation of those created by the Law relating to Emergency Taxes for the North China Incident. It may further be noted that this Law is to be abrogated on December 31 of the year following the year in which the China incident comes to an end. The important points of the Law are summarised as follows:

1. Increase in the Income Tax.

(A) Income coming under Class I.

(a) Ordinary income of corporations and net assets of corporations at liquidation or amalgamation.

In the case of the ordinary income of corporations, the tax rates of 5% as provided for in the Income Tax Law is raised to 12.25%, and in the case of the net assets of corporations at liquidation or amalgamation, the rate of 10% is raised to 22.5%. As, however, these two rates had already been increased to 11% and 22% respectively by the Temporary Tax Increase Law and the Law relating to Emergency Taxes for the North China Incident, the actual increase in the tax rates under the present Law is 1.25% and 0.5% respectively.

(b) Excess profits of corporations.

The tax rate on the excess profits of corporations is increased by 10% of the tax as assessed under the Income Tax Law. It should, however, be noted that this increased rate is the same as provided for in the Law relating to Emergency Taxes for the North China Incident and not that newly realized by the present Law.

(c) Restrictive provisions.

It is regulated by the Law that the total of the increased taxes on the ordinary income of corporations and on the excess profits of corporations and the special profits tax should not exceed 50% of the ordinary income of corporations.

(d) Undivided profits of family corporations.

The tax rate is increased by 83.75% of the tax as assessed under the Income Tax Law. As, however, the rate nad already been increased by 50% by the Temporary Tax Increase Law and by 15% by the Law relating to Emergency Taxes for the North China Incident, the actual increase under the

Digitized by Google

a corporation which, though not having a head office or principal business office within the territory where this Law is in force, has capital within the territory where this Law is in force is made in the same manner as mentioned above.

The tax rate is 0.1%. When, however, the tax calculated is less than ¥10, it is levied at the rate of ¥10 a year. Corporations without any income are exempted from the imposition of the tax. (For the temporary increase in the tax rate, see the Law relating to Emergency Taxes for the China Incident).

4. Corporations exempted from the Tax.

Corporations on the non-commercial basis, which are exempted from the imposition of the income tax in accordance with the Income Tax Law and other laws, are exempted from the Tax on the Capital of Corporations.

Special Tax on Foreign Currency Securities

The Law relating to this tax was promulgated by Law No. 5 of 1937, and put into effect as from April 1 of the same year. The important points of the Law are summarized as follows:

1. Tax Payers.

Holders of foreign currency securities, who have domicile or a temporary residence for one year or more within the territory where this Law is in force, are liable for payment of this tax. "Foreign currency securities" here means Japanese national bonds, Japanese municipal bonds, and debentures issued by Japanese corporations, all expressed in foreign currencies.

2. Basis of Assessment.

The tax is levied on interest on foreign currency securities. Interest received between January 1 and June 30, and that received between July 1 and December 31, are taken as the assessable amount.

3. Tax Rates.

(a) In the case of interest on national bonds in foreign currencies:

7/10 of the amount remaining after deduction of the amount equivalent to 5% (a year) of the face-value.

(b) In the case of interest on foreign currency securities other than national bonds in foreign currencies:

7/10 of the amount remaining after deduction of the amount equivalent to 5.5% (a year) of the face-value.

4. Tax Exemption.

The following interest is exempted from the imposition of the tax:—

(a) Interest on foreign currency securities as received by holders who are exempted from the Class II income tax under the Income Tax Law and other laws.

(b) Interest on foreign currency securities held outside the Japanese Empire including Kwantung Province and Nanyo (Mandated territory in the Pacific).

(c) Interest on national bonds in foreign currencies with interest rates not exceeding 5% a year.

(d) Interest on foreign currency securities (other than national bonds in foreign currencies) with interest rates not exceeding 5.5% a year.

(e) Interest on foreign currency securities issued under the contract that the issuer of the securities will pay the tax; provided, however, that such contract must be that concluded before January 1, 1937.

Gasoline Tax

The Law relating to this tax was promulgated by Law No. 6 of 1937, and put into operation as from April 1 of the same year. The important points of the Law are summarised as follows:

1. Taxable Article.

The tax is levied on gasoline (mineral oil, the specific gravity of which is not exceeding 0.8017 at 15° C.), except in the case of gasoline manufactured from coal, lignite, oil shale, or natural gas.

2. Tax Rate.

¥13.2 per kilolitre.

3. Collection of Tax.

The gasoline tax is collected, at the time gasoline is delivered from the factories or bonded areas, from persons who take delivery of the gasoline; provided, however, that in the event of the security equivalent to the tax being offered in accordance with the provisions of Ordinance, the collection of such tax may be postponed for a period not exceeding two months.

Tax on the Transfer of Securities

The Law relating to this tax was promulgated by Law No. 7 of 1937, and put into effect as from April 1 of the same year. The important points of the Law are summarised as follows:—

under Class I, the prices of which are below the fixed level. The details of assessable commodities are mentioned in the table annexed to Imperial Ordinance No. 200 of 1938.

Class I.

A. (1) Precious stones or semi-precious stones, or commodities combined with precious or semi-precious stones.
(2) Pearls or commodities combined with pearls.
(3) Manufactures of precious metals or commodities combined with gold or platinum.
(4) Manufactures of tortoise shell.
(5) Manufactures of corals.

B.

(6) Clocks and watches.
(7) Fountain pens, gold pens and sharp pencils.
(8) Jewelry and other articles for personal adornment.
(9) Toilet instruments.
(10) Smoking instruments.
(11) Hats, caps, bonnets, sticks, whips, umbrellas, and parasols.
(12) Bags and trunks made of leather or metal.
(13) Boots, shoes, slippers, sandals, clogs, and the like.
(14) Pictures and writings and curios.
(15) Articles for interior ornamentation.
(16) Illuminators.
(17) Articles for go and chess playing.
(18) Furnitures.
(19) Lacquer-ware, pottery and glass manufactures, not otherwise provided for.
(20) Manufactures coated or covered with precious metals, not otherwise provided for.
(21) Furs or fur manufactures.
(22) Manufactures of feathers or those combined with feathers.
(23) Manufactures of leather, not otherwise provided for.
(24) Knitted tissues, lace tissues, felt, and manufactures thereof.

Class II.

A. (1) Photographic instruments, photographic enlargers, cinematograph projectors, and parts and accessories thereof.
(2) Dry plates, films and sensitized paper for photograph.
(3) Phonographs and parts thereof.
(4) Records for phonographs.
(5) Musical instruments and parts and accessories thereof.
(6) Binoculars and monocles.
(7) Rifles and parts thereof.
(8) Cartridges and bullets.
(9) Golf instruments and parts and accessories thereof.
(10) Motor boats, skirrs, and yachts for recreation.
(11) Billiard instruments.
(12) Neon tubes and transformers thereof.
(13) Lighters for smoking.

B.

(14) Radio receiving sets and parts thereof.
(15) Vacuum-tubes for radio receiving and microphones.
(16) Electric fans and parts thereof.
(17) Electric, gas and mineral oil stoves for heating.
(18) Refrigerators and parts thereof.
(19) Safes and steel furnitures.
(20) Automobiles.
(21) Toilet articles.

Class III.

(1) Matches.
(2) Saké and other alcoholic liquors, excluding Dakushu (unrefined or muddy saké) and that made from fruits.

(B) Tax Payers.

In the case of the commodities under Class I, retailers are liable for payment of this tax, and in the case of the commodities under Class II and III manufactures are under obligation to pay the tax; provided, however, that as regards the commodities taken delivery of from the bonded areas, persons who take delivery of such commodities are liable for payment of the tax.

(C) Basis of Assessment and Tax Rates.

In the case of the commodities under Class I, assessment is made on the basis of the selling price of retailers; in the case of the commodities under Class II, on the basis of the price at a time when such commodities are taken out of the factories; and in the case of the commodities under Class III, on the basis of quantity (matches: match-sticks and saké and other alcoholic liquors: koku).

The following rates are applicable:

Class I.
- A 15% of the price.
- B 10% of the price.

Class II.
- A 15% of the price.
- B 10% of the price.

Class III.
- (1) 5 sen per 1,000 match-sticks.
- (2) Saké and other alcoholic liquors:
  - (a) Seishu (refined saké), shirozaké (white saké), mirin (sweet saké) shochu (distilled saké), and beer 5 yen per koku.
  - (b) Wine 10 yen per koku.
  - (c) Others (only those subject to the Law relating to the Tax on Alcohol and Alcoholic Liquors) 7 yen per koku.

Digitized by Google

(D) Tax Exemption.

The following commodities are exempted from the tax:

(a) Commodities used for the manufacture of those coming under Class II.

(b) Wine used for the brewing of saké and other alcoholic liquors.

(c) Commodities of export.

(d) Commodities used for scientific research.

(e) Commodities used for medical treatment, for manufacturing of machinery or manufacturing industry, for a ceremony or a divine service in Shinto shrines and Buddhist temples, for education, for military purposes, and for communication.

It should, however, be noted that the Hokkaido, prefectures, cities, towns, and villages are prohibited in principle to impose a surtax in respect of the taxes newly created or increased under the present law and to impose local taxes on the basis of admission fees on which the Admission Tax and the Special Admission Tax are levied.

Law Relating to Emergency Measures Regarding Taxes

This Law provides en bloc emergency measures to be taken regarding taxes to cope with the changes in economic conditions that may arise from the developments of the China incident. By this Law not only are reductions made in the rates of the Land Tax on Rice and Other Fields, the Business Profits Tax, the Tax on Mining Products, the Special Tax on Mining Products, and the Textiles Consumption Tax, but also the Special Placer Tax is created.

1. Reductions in the Land Tax on Rice and Other Fields and the Business Profits Tax

(1) When the incomes of independent farmers show a decline of more than 25% as against the average profits of the years 1934, 1935 and 1936, reductions of 20 to 50% of the land tax on rice and other fields are made.

(2) When the net profits from businesses show a decline of more than 25% as against the average net profits of the years 1934, 1935 and 1936, reductions of 20 to 50% of the business profits tax are made, provided, however, that this does not apply to cases where the net profits are in excess of ¥6,000. It should, however, be noted that in cases where the capital of a corporation is in excess of ¥200,000, no reduction is made notwithstanding that net profits are less than ¥6,000.

2. Emergency Measures regarding Mining Products

(1) In order to encourage the production of the important mining products, such as gold, copper, tin, zinc, iron sulphide, manganese, and nickel ores, the mining sets created as from January 1, 1938 are exempted from the imposition of the Tax on Mining Products or the Special Tax on Mining Products. When output of each year exceeds the total products of 1937, that portion of excess is exempted from the imposition of the Tax on Mining Products or the Special Tax on Mining Products.

(2) With a view to encouraging the working of dormant mining sets, the Special Placer Tax is imposed on the holders of alluvial mining rights whose object is the extraction of alluvial ores other than alluvial gold, and the tax rate is 30 sen per cho or 1,000 tsubo of placer areas.

3. Partial Exemption from the Textiles Consumption Tax

For the purpose of effecting ecoromy in the consumption of raw cotton, the tissues manufactured with cotton yarns mixed with more than the fixed quantity of staple fibres or hemp, and the tissues manufactured with these mixed yarns and rayon yarns are exempted from the imposition of the Textiles Consumption Tax.

Partial Revision While general reform in central and local taxation systems has been postponed on account of changes in the basis factors underlying taxation owing to the outbreak of the China incident, the following partial revisions have been made with a view to adjusting as far as possible the burden imposed on the people by the current system.

1. The Temporary Tax Increase Law. Under this law, income taxes and succession taxes on individuals had been increased somewhat roughly with extra rates imposed on upper brackets. Under the current revision, moderate progressive rates have been adopted.

2. The Income Tax Law. An income tax will be imposed on retirement allowances or other allowances of like nature in excess of ¥5,000, and also on postal annuities after deducting the amounts of premiums paid. The income tax has also been imposed on the inhabitants of the Ogasawara Islands and the seven islands of Izu.

3. The Succession Tax Law. This law has been so revised that the tax shall be levied in principle on all inherited property on a composite basis, irrespective of location. Another change made is that when a successor receives life insurance money or other special al-

Digitized by Google

lowances in excess of ¥5,000 due to death of the succeeded, the excess portion is to be included in the property to be assessed.

4. The Registration Tax Law. Alleviation is made in the rates of this tax against the acquirement of ownership of real estate through transaction or donation, with a view to lessening the tax burden on holders of immovable property.

5. The Brewery Tax Law. A licence system has been adopted with regard to sale of liquors, beer, other alcoholic beverages and alcohol in order to insure perfect application of the brewery tax. The Laws Concerning the Saké Tax, the Alcohol and Alcoholic Beverage Tax and Beer Tax have been revised accordingly.

BANKING AND THE MONEY MARKET

Banking in 1937 and 1938

Returns of the Bank of Japan Private deposits with the Bank of Japan in 1937 remained in monthly average between 102 million and 71 million yen, showing a slight increase over the preceding year. The maximum figure of the year was 183 million and the minimum 55 million. The volume of deposits on December 31 totalled 140 million, an increase of 7 million over the corresponding figure a year ago.

The volume of advances ranged in monthly average from 526 million to 753 million yen. In the first six months of the year, it showed a decline below the corresponding period of the preceding year due largely to a construction of the advances for foreign exchange contracts, while in the second six months, large requirements of credits for foreign exchange contracts and for industrial purpose caused an increase. The highest figure of the year was 821 million and the lowest 503 million. On December 31, the volume totalled 628 million, a decline of 117 million as compared with the corresponding figure a year ago.

Government current deposits with the Bank remained in monthly average between 298 million and 146 million yen, and the average for the year showed a slight decline as against the preceding year. The maximum of the year was 412 million and the minimum 70 million. The volume on December 31, at 188 million, represented an increase of 83 million over the corresponding figure a year ago.

The issue of Bank notes continued to expand during 1937, the average for the year, at 1,535 million yen, representing a growth of 195 million yen over that of the preceding year. This growth was due to the increased demand for currency arising from the expansion of commercial transactions, to an increase in notes applicable to the reserves against the issue of the notes of the Bank of Chosen and the Bank of Taiwan, and to other factors. The highest figure of the year was 2,399 million and the lowest 1,319 million. The issue on December 31, at 2,305 million, represented an increase of 440 million over the corresponding figure a year ago.

Movement of Funds The rate of increase in deposits in banks throughout the country, excluding the Bank of Japan, somewhat slowed down in 1937 as compared with the preceding year, but taking the year as a whole, the volume of deposits, influenced by activity in financial circles, was still on the increase. The volume that stood at 13,816 million yen on January 31, increased to 14,305 million on March 31, and to 14,893 million on June 30. In July when the China incident broke out, however, the movement of deposits resulting from the development of the situation carried the volume down to 14,646 million, this being 247 million less than a month earlier. From August onward, it tended upward, and after rising in November to the 15,000 million level, it touched on December 31 at 15,747 million, representing a rapid increase of 1,778 million over the corresponding figure a year ago.

Under the influence of the strong demand for industrial funds resulting from the expansion of productive capacity, the growth of credits caused by the recession of activity in the issue market, accommodation of funds available for calls in respect of shares, and the increase in credit requirements for commercial transactions, the volume of advances continued to expand from the commencement of 1937. After the outbreak of the China incident, moreover, steady progress in the expansion of productive capacity, especially in the munitions industry, combined with the development of the situation in China, provoked a greater demand for funds than before, resulting in a sharp increase in advances. The volume of advances that stood at 9,995 million yen on January 31, rose to 10,558 million on June 30. It exceeded the level of 11,000 million on October 31 and touched on December 31 at 11,653 million, representing an increase of 1,637 million as against the corresponding figure a year ago.

Cash deposits in trust companies throughout the country indicated a rising tendency from the beginning of 1937. The volume, remaining at 1,840

lowances in excess of ¥5,000 due to death of the succeeded, the excess portion is to be included in the property to be assessed.

4. The Registration Tax Law. Alleviation is made in the rates of this tax against the acquirement of ownership of real estate through transaction or donation, with a view to lessening the tax burden on holders of immovable property.

5. The Brewery Tax Law. A licence system has been adopted with regard to sale of liquors, beer, other alcoholic beverages and alcohol in order to insure perfect application of the brewery tax. The Laws Concerning the Saké Tax, the Alcohol and Alcoholic Beverage Tax and Beer Tax have been revised accordingly.

CHAPTER IX

BANKING AND THE MONEY MARKET

Banking in 1937 and 1938

Returns of the Bank of Japan Private deposits with the Bank of Japan in 1937 remained in monthly average between 102 million and 71 million yen, showing a slight increase over the preceding year. The maximum figure of the year was 183 million and the minimum 55 million. The volume of deposits on December 31 totalled 140 million, an increase of 7 million over the corresponding figure a year ago.

The volume of advances ranged in monthly average from 526 million to 753 million yen. In the first six months of the year, it showed a decline below the corresponding period of the preceding year due largely to a construction of the advances for foreign exchange contracts, while in the second six months, large requirements of credits for foreign exchange contracts and for industrial purpose caused an increase. The highest figure of the year was 821 million and the lowest 503 million. On December 31, the volume totalled 628 million, a decline of 117 million as compared with the corresponding figure a year ago.

Government current deposits with the Bank remained in monthly average between 298 million and 146 million yen, and the average for the year showed a slight decline as against the preceding year. The maximum of the year was 412 million and the minimum 70 million. The volume on December 31, at 188 million, represented an increase of 83 million over the corresponding figure a year ago.

The issue of Bank notes continued to expand during 1937, the average for the year, at 1,535 million yen, representing a growth of 195 million yen over that of the preceding year. This growth was due to the increased demand for currency arising from the expansion of commercial transactions, to an increase in notes applicable to the reserves against the issue of the notes of the Bank of Chosen and the Bank of Taiwan, and to other factors. The highest figure of the year was 2,399 million and the lowest 1,319 million. The issue on December 31, at 2,305 million, represented an increase of 440 million over the corresponding figure a year ago.

Movement of Funds The rate of increase in deposits in banks throughout the country, excluding the Bank of Japan, somewhat slowed down in 1937 as compared with the preceding year, but taking the year as a whole, the volume of deposits, influenced by activity in financial circles, was still on the increase. The volume that stood at 13,816 million yen on January 31, increased to 14,305 million on March 31, and to 14,893 million on June 30. In July when the China incident broke out, however, the movement of deposits resulting from the development of the situation carried the volume down to 14,646 million, this being 247 million less than a month earlier. From August onward, it tended upward, and after rising in November to the 15,000 million level, it touched on December 31 at 15,747 million, representing a rapid increase of 1,778 million over the corresponding figure a year ago.

Under the influence of the strong demand for industrial funds resulting from the expansion of productive capacity, the growth of credits caused by the recession of activity in the issue market, accommodation of funds available for calls in respect of shares, and the increase in credit requirements for commercial transactions, the volume of advances continued to expand from the commencement of 1937. After the outbreak of the China incident, moreover, steady progress in the expansion of productive capacity, especially in the munitions industry, combined with the development of the situation in China, provoked a greater demand for funds than before, resulting in a sharp increase in advances. The volume of advances that stood at 9,995 million yen on January 31, rose to 10,558 million on June 30. It exceeded the level of 11,000 million on October 31 and touched on December 31 at 11,653 million, representing an increase of 1,637 million as against the corresponding figure a year ago.

Cash deposits in trust companies throughout the country indicated a rising tendency from the beginning of 1937. The volume, remaining at 1,840

Important Laws Issued The law amending the law concerning the Central Chest for Cooperative Societies was promulgated on March 18, 1938. In view of the existing methods of financing the fishing industry, the present amendment provides for participation on the part of the Federation of Fishery Associations and the Union of Fishing Industries in the Central Chest for Cooperative Societies. In keeping with this arrangement the capital of the said Chest will be increased by ¥5,000,000, one-half of which amount will be contributed by the Government. The number of councillors of the Chest will also be increased. The new Law provides that should dividends awarded to contributors other than the Government fall below the stated rate, a limit shall be imposed on the dividend to be paid on the Government contribution. The effective date of this Law is to be fixed by Imperial Ordinance with each provision considered separately.

On March 31, 1938, the Law Concerning Security Underwriting was promulgated. The purpose of this Law is to ensure more adequate control over the underwriters of securities, who play an important part in the money market and in financing growing industrial activities. It places the business of security underwriting on a licence basis and defines clearly the scope of the business. The Law prohibits any company with a capital of less than ¥2,000,000 from conducting this business and authorizes the competent Cabinet Minister to suspend the operations of an existing business when deemed necessary, as well as other measures. Any violation of the Law or of ministerial orders shall be punished by suspension of business, re-election of the officers of companies or cancellation of licences. This Law shall not apply to banks, trust companies and persons legally incorporated under special laws who handle the underwriting of securities.

On April 1, 1938, the Law concerning Temporary Extension of the Maximum Limit for Issuing Convertible Notes against Securities by the Bank of Japan was promulgated. In view of the fact that the note issue of the Bank of Japan is tending to increase in connection with the China Affair, the present Law provides for the raising of the maximum limit of note issue against security reserves by 700,000,000, from the former ¥1,000,000,000 to ¥1,700,000,000. This Law is to be annulled within one year after the termination of the Affair.

Imperial Ordinance Concerning Organization of Commission to Promote Savings was promulgated on June 6, 1938. This Commission has been created to conduct investigations and studies concerning the promotion of savings on the part of the people. It functions under the supervision of the Minister of Finance. The Commission is empowered to make recommendations to the Ministers concerned. The Minister of Finance is ex officio chairman of the Commission, which consists of members chosen from among senior officials in Government service, members of the House of Peers and the House of Representatives and private persons with knowledge and experience in pertinent matters.

The Imperial Ordinance for Amendment to the Ordinance Concerning the Temporary Capital Adjustment Law was issued on August 15, 1938. With regard to the condition of demand for capital and commodities and with a view to adjusting the demand more drastically, the minimum amounts subject to licence or approval under the above-named law have been lowered as regards capital investment and loans. In consequence, the limits were lowered from ¥500,000 to ¥200,000 in the case of corporation capital, and from ¥150,000 to ¥100,000 in the following cases: loans, subscription acceptance, transactions in subscriptions of securities and establishment of new equipment, extension or improvement with one's own capital.

Remarks: The figures do not include accounts of the banks located outside of Japan proper, Taiwan and Karafuto.

Various loans made by savings banks are collectively included in the item of loans on bonds.

The Bank of Japan

(Nippon Ginko)

The Bank of Japan, established in 1882, is the central bank of the Empire on the strength of its privilege of issuing convertible bank notes and its management of Treasury receipts and disbursements as well as the important part it plays in adjusting the money market through the execution of its money rate policies and its conduct of open market operations (See pp. 325-327, Japan Year Book, 1936).

In August, 1937, there were promulgated the Gold Reserve Valuation Law and other laws regarding the gold reserve of the Bank of Japan. In respect of the gold coins and bullion held by the Bank as the reserves for exchange against convertible bank notes, valuation has hitherto been made at the rate of ¥1 per 750 milligrammes of fine gold in accordance with the provisions of the Coinage Law. As, however, owing to a substantial advance in the price of gold in recent years, the valuation made at such rate could not indicate the actual position of the gold reserve of the Bank of Japan, a decision was taken to increase the value of gold applied to the reserves to the approximate level of the current international value. It was, however, recognized that in the world situation when the currencies of various countries are still unstabilized, the time is not yet opportune for changing the value of Japanese currency by

Digitized by Google

Yokohama Specie Bank

(Yokohama Shokin Ginko)

The Yokohama Specie Bank is an organ charged with the special task of affording financial facilities for foreign trade through its conduct of the foreign exchange business (See pp. 328, 329, Japan Year Book, 1936). The importance of its functions cannot be over-emphasized in view of the fact that Japan, being rather poor in natural resources, has to import from foreign countries such materials for her major industries as raw cotton, wool, crude oil and iron on the one hand and on the other, export her manufactures such as piece-goods, rayon textiles and raw silk in order to support her rapidly growing population.

The clash over the issue of banknotes between it and the Bank of Chosen, which had been issuing gold notes in Manchuria, was settled on October 1, 1936, through the withdrawal of the Chao-piao in Manchoukuo including the Kwantung Leased Territory.

Remarks: The figures do not include accounts of the banks located outside of Japan proper, Taiwan and Karafuto.

Various loans made by savings banks are collectively included in the item of loans on bonds.

The Bank of Japan

(Nippon Ginko)

The Bank of Japan, established in 1882, is the central bank of the Empire on the strength of its privilege of issuing convertible bank notes and its management of Treasury receipts and disbursements as well as the important part it plays in adjusting the money market through the execution of its money rate policies and its conduct of open market operations (See pp. 325-327, Japan Year Book, 1936).

In August, 1937, there were promulgated the Gold Reserve Valuation Law and other laws regarding the gold reserve of the Bank of Japan. In respect of the gold coins and bullion held by the Bank as the reserves for exchange against convertible bank notes, valuation has hitherto been made at the rate of ¥1 per 750 milligrammes of fine gold in accordance with the provisions of the Coinage Law. As, however, owing to a substantial advance in the price of gold in recent years, the valuation made at such rate could not indicate the actual position of the gold reserve of the Bank of Japan, a decision was taken to increase the value of gold applied to the reserves to the approximate level of the current international value. It was, however, recognized that in the world situation when the currencies of various countries are still unstabilized, the time is not yet opportune for changing the value of Japanese currency by

Digitized by Google

amendment of the Coinage Law, and consequently, a step has provisionally been taken to alter the value of gold applied to the reserves, notwithstanding the provisions of the Coinage Law, by making valuation at the rate of ¥1 per 290 milligrammes of fine gold. At the same time, both the Bank of Japan's obligation (as provided for in the Convertible Bank Note Regulations) to convert the bank notes into gold coins and the Government obligation (as provided for in the Coinage Law) to comply with the requirements of persons who bring gold bullion for the minting of gold coins have been suspended for the time being. It should further be noted that not only has revaluation been made in the same manner of the gold coins and bullion held by the Bank of Chosen and the Bank of Taiwan as the reserves for exchange against convertible bank notes, but the Government has also authorized these two Banks to transfer such gold in whole or in part to the Bank of Japan for the purpose of securing the centralization of gold holdings into the Bank of Japan. The profits obtained by the Bank of Japan from such revaluation have been paid to the Government, and with the amount so paid the Government has created a Gold Fund Special Account. Certain portion of this fund is applied to expenses necessary for the increase of gold production, while certain portion is used for the purchase of gold bullion or investment in national bonds. It was in September, 1937, that investments in industrial debentures were allowed to be made from this Account. Another law, namely, the Gold Production Law was enacted to secure the centralization of gold holdings and the increase of gold production, whereby the Government is authorized to purchase new gold with the funds of the Gold Fund Special Account, with the result that the Law concerning the Purchase of Gold by the Bank of Japan has been abrogated.

In consequence of the aforesaid revaluation and other factors, the gold reserve of the Bank of Japan expanded to some 800 million yen. In view, however, of the Government policy of increasing the exports from the country by facilitating the importation of certain materials used for merchandise of export, and also of the existing position of exchange funds, the Bank of Japan created on July 23, 1938 the Special Fund for Foreign Exchange with 300 million yen released from its holding of gold bullion, and deposited the fund with the Yokohama Specie Bank. This fund is, as mentioned above, made available for financing imports when necessary, and is replenished with the proceeds of export bills. When it becomes unnecessary to maintain this fund, it will at any time be restored to the gold reserve of the Bank of Japan.

Yokohama Specie Bank

(Yokohama Shokin Ginko)

The Yokohama Specie Bank is an organ charged with the special task of affording financial facilities for foreign trade through its conduct of the foreign exchange business (See pp. 328, 329, Japan Year Book, 1936). The importance of its functions cannot be over-emphasized in view of the fact that Japan, being rather poor in natural resources, has to import from foreign countries such materials for her major industries as raw cotton, wool, crude oil and iron on the one hand and on the other, export her manufactures such as piece-goods, rayon textiles and raw silk in order to support her rapidly growing population.

The clash over the issue of bank-notes between it and the Bank of Chosen, which had been issuing gold notes in Manchuria, was settled on October 1, 1936, through the withdrawal of the Chao-piao in Manchoukuo including the Kwantung Leased Territory.

The Hypothec Bank of Japan (Nippon Kwangyo Ginko)

With an authorized capital standing at upwards of ¥110,000,000 and advances reaching the neighbourhood of ¥1,000,000,000, the Hypothec Bank of Japan is now, in fact as well as in name, the central organ of the nation in making loans on mortgage of immovable property. Since 1921, when a law governing the amalgamations was promulgated, it has annexed the greater part of the Agricultural and Industrial Banks (Noko Ginko), which were established as prefectural financial institutions for accommodating provincials with loans on security of immovable property.

The tendency toward such mergers was further promoted following the formation of the Hirota Cabinet, the Agricultural and Industrial Bank of Tokyo Prefecture being annexed to the Hypothec Bank. There are at present only 16 Agricultural and Industrial Banks as compared with 46 in 1900. By thus increasing its capital and enlarging its structure, the Hypothec Bank is becoming more and more positive in improving the financial conditions of cities and agricultural districts (See pp. 330-332, Japan Year Book, 1936)

Agricultural and Industrial Banks (Noko Ginko)

The Agricultural and Industrial Banks are prefectural financial institutions for accommodating provincials with long-term loans at a low rate of interest on security of immovable property and, being established in every prefecture, are most useful through their connection with their central institution, the Hypothec Bank of Japan. But with a view to affording further financial facilities to local districts, the law concerning the amalgamation of the Hypothec Bank and the Agricultural and Industrial Banks was enacted in 1921. By virtue of this law the former was allowed to take over the business of the latter on condition that it establish its branches in places where head offices and branches of the latter were in existence. The Agricultural and Industrial Banks are joint-stock companies, each having a capital of not less than ¥200,000. Each of these banks has, as a general rule, for its exclusive business district a prefecture. The business of the Agricultural and Industrial Banks is principally the same as that of the Hypothec Bank of Japan. These banks may become agents for the Hypothec Bank or other Agricultural and Industrial Banks. When acting as agents for loans made by the Hypothec Bank, Agricultural and Industrial Banks may guarantee to the bank the solvency of the debtors. They may take charge of the receipt and disbursement of the funds of prefectures or cities. They are authorized, when at least one-fourth of the nominal capital has been paid up, to issue agricultural and industrial debentures to an amount not exceeding fifteen times the paid-up capital. Such debentures, however, must not exceed the amount remaining after the deduction of the amount of pledges given for money borrowed from the Hypothec Bank from the total amount of outstanding loans redeemable by annual instalments and at a fixed time. The face-value of agricultural and industrial debentures which was originally not less than twenty yen has been reduced to ten yen and upward; and when debentures of not

Digitized by Google

more than twenty yen face value are to be issued, such issue may be effected by sale. For this purpose a term must be fixed for the sale, and the amount sold within that term is taken as the amount of issue. These agricultural and industrial debentures must be redeemed by means of drawings at least twice a year in amounts proportionate to the amount to be redeemed in the same year of the loans redeemable by annual instalments except that part thereof given as security to the Hypothec Bank as mentioned above. There were 6 of these banks in existence throughout the country at the end of 1937.

The Industrial Bank of Japan
(Nippon Kogyo Ginko)

The primary function of the Industrial Bank of Japan is to underwrite national and prefectural bonds and company debentures and make loans on security of foundations created as prescribed by law. Its leadership among the underwriters is attracting a great deal of public attention, particularly because of its efforts to purify the underwriting world and rationalize the terms for underwriting. In addition to its endeavours for promoting financial facilities for medium-sized and small-scale industry, this bank is now being called upon to become more active in the furtherance of the shipbuilding industry along the lines of the national policy on shipping (See pp. 333, 334, Japan Year Book, 1936).

The Hokkaido Colonial Bank
(Hokkaido Takushoku Ginko)

The Hokkaido Colonial Bank was established with the object of supplying capital for enterprises for colonizing and developing Hokkaido and Karafuto (the Japanese half of Saghalien), and especially for the purpose of facilitating the supply of capital by making loans on

Digitized by Google

security of agricultural products and company shares and debentures as well as making long-term loans at low interest rate on immovable property. The bank had at first a capital of ¥3,000,000 but on April 23, 1922 it was increased to ¥20,000,000, of which ¥12,500,000 has been paid up. The business scope is very much similar to that of the Hypothec Bank of Japan and the Agricultural and Industrial Banks. The bank is authorized to issue debentures of not less than ten yen face value to an amount not exceeding 15 times its paid-up capital. Such debentures, however, must not exceed the total outstanding amount of loans which are redeemable by annual instalments or at a fixed date, and when debentures of not more than twenty yen face value are to be issued by the bank such issue may be effected by sale. These debentures must be redeemed by means of drawings at least twice a year in amounts proportionate to the amount of the said loans to be redeemed in the same year.

The Bank of Taiwan (Taiwan Ginko)

The Bank of Taiwan was founded in September, 1889, four years after Japan's occupation of Formosa, as the result of the Sino-Japanese War.

It is a joint-stock company with an authorized capital of ¥15,000,000, of which ¥13,125,000 has been paid up.

The Bank is privileged to issue banknotes of denomination of one yen and upward, which are at any time convertible into gold yen. It is required to hold as conversion reserve gold and silver coins and bullion of the same amount as the notes issued; the amount of notes not covered by this specie reserve is limited to ¥20,000,000; they may be issued on security of Government paper money and securities, notes of the Bank of Japan, and other bonds and commercial bills of a reliable nature. Notes issued beyond this limit are subject to a tax of not less than three per cent, per annum.

The Bank of Chosen
(Chosen Ginko)

The Bank of Korea was established in October, 1909, its name being changed to the Bank of Chosen in 1911 by virtue of the Bank of Chosen Act issued by the Government following Korea's annexation to Japan in April, 1910. The bank took over the assets and liabilities of the Bank of Korea, following the transfer of the assets and liabilities of the Dai-Ichi (First) Bank, which had been established in Korea since 1879, and which had received its right of issuing notes in that country in 1901, and which had acted as the central Japanese banking institution since the close of the Russo-Japanese War. The bank is authorized to issue bank notes. In 1917 the bank's notes were given sole right of legal tender in the Kwantung Leased Territory and along the South Manchuria Railway, and the limit of its guaranteed note issue was increased to ¥50,000,000. The bank greatly increased its activities during the World War extending to Japan proper, where it commenced foreign exchange transactions. The financial reaction following the World War caused it to narrow its business activities. It wrote off frozen assets to the amount of ¥36,000,000 for the first half of 1925 and halved its capital to ¥40,000,000. The bank borrowed a large amount of money from the Bank of Japan after 1920 on 10 years' repayment. Through revision of the Bank of Chosen Act in 1924 the right of control of the bank was transferred from the Governor-General of Korea to the Minister of Finance. After the foundation of Manchoukuo, however, steps were taken by the Manchou Government to stabilize the value of the yuan and to adjust the complicated currency system of that country, and in conformity with this policy, the Bank of Chosen reduced the issue of its notes in Manchoukuo (excluding Kwantung Province) from December 23, 1935 onward. Simultaneously with the establishment of the Industrial Bank of Manchou at Hsingking, the branches of the Bank of Chosen in Manchoukuo (excluding Kwantung Province) were all turned over to the Industrial Bank of Manchou in December, 1936, with the result that the issue of the Bank of Chosen notes in Manchoukuo was entirely discontinued. It may further be noted that with the abolition of extra-territoriality in Manchoukuo and the transfer of the administrative power in the South Manchuria Railway Company Zone to Manchoukuo on December 1, 1937, the provisions respecting the legal tender of the Bank of Chosen notes in the Zone were also abrogated.

Trust Business

Wartime Effect on Trust Companies The accounts of trust companies in this country had been steadily increasing during the past 10 years at the rate of an annual average of ¥160,000,000. When the taxation reform plan worked out under the quasi-wartime system was announced during the latter part of 1936, however, the increasing rate of monetary trusts which form the major part of the accounts of trust companies slackened on account of the fear of a heavy tax. In February, 1937, the taxation reform plan was replaced by a temporary taxation increase plan which brought about an atmosphere of assurance in financial circles. The monetary trusts then showed a sign of a renewed tendency toward increase but the expectations of a definite increase were bound to remain unfulfilled as funds poured into the stock

Digitized by Google

market manifesting a remarkable activity during April.

Further, the strained relations with China and the Soviet Union caused a tremendous amount of funds to be assigned to the purchase of raw materials from foreign sources and the expansion of the productive facilities of the domestic industry. Under the circumstances, withdrawals of monetary trusts which fell due were far in excess of new trusts. Thus, the accounts of trust companies which recorded an increase of only ¥72,000,000 between the end of 1936 and May, 1937, began to show a decrease in June, which was the first phenomenon of its kind since December, 1932. The decreasing tendency of monetary trusts was still in evidence in August although the total amount of the accounts of trust companies showed a slight increase because of increased securities trusts.

In order to cope with the situation, the Mitsui Trust Company modified its time-honoured policy and alleviated the restrictions on the acceptance of big lots of monetary trusts in the form of fixed deposits. This action on the part of the Mitsui Trust attracted a great deal of attention in the banking circles. During the past several years of depression when a low-interest tendency prevailed, local banks, insurance companies and leading industrial companies were inclined to put their spare funds in trust for a higher interest. Considering such trusts as unsteady and tending to lower unduly the yields of trusts in general, the Mitsui Trust Company adopted a policy of avoiding acceptance of them as much as possible. The situation, however, changed in 1937 in such a manner that even big lots of trusts were not considered as unsteady and there was no uncertainty as to the manner of investment as there was an active demand for industrial funds.

Change in Substance of Assets As already stated, monetary trusts fell into an unusual depression at the beginning of 1937 and thus exercised a negative influence on the whole assets of trust companies for a time, which is an unusual phenomenon in recent years. Still more abnormal was the rapid increase of leading securities put in trust. Accounts indicated that monetary trusts had recorded an increase of ¥32,000,000 at the end of December, 1937, over the figures for the end of December, 1936, but, as a matter of fact, the monetary trusts were at a standstill because the system of accounting of trust companies reckons the monthly profits amounting to several millions of yen as a natural increase in trusts under ordinary circumstances. Securities trusts, on the other hand, increased by as much as ¥100,000,000 during the same period. This was the first time that securities trusts increased in a larger measure than monetary trusts.

During 1933, monetary trusts accounted for 96 per cent of the increased trusts. This percentage then declined to 91 per cent and later to 78 per cent and finally fell to 20 per cent in December, 1937. On the contrary, securities trusts exhibited an increasing tendency and far surpassed monetary trusts in 1937.

A review of the operating conditions of assets of trust companies during 1937 reveals that the amount of securities in hand, which had recorded an unusual increase at the end of 1936, appeared to have slowed down while advances increased markedly. The slackened rate of increase in the securities in hand was due to a decrease in foreign bonds as well as in local bonds and debentures which in turn was attributable to the depression in underwriting circles. On the other hand, the marked increase in advances was illustrative of the active demand for industrial funds.

Increased Influence of Trust Companies The total assets of trust companies throughout the country now reach upwards of ¥2,700,000,000. As a result of the increased financial influence of the trust companies, the question of co-operation between the trust companies and underwriting circles is assuming an increasing importance as also the question of defining the spheres of influence of the trust companies and banks.

Although there exists a general contention that the spheres of activities of trust companies and banks are not clearly defined, it is an admitted fact that the trust companies are increasingly becoming a machinery for long-term financial contracts. Monetary trusts under contracts lasting for five years or more accounted for only 6 per cent of the total amount of trusts at the end of 1926 but the figure increased to approximately 30 per cent at the end of 1935 while the percentage of those under contracts lasting for less than five years decreased from over 87 per cent to nearly 66 per cent. This fact indicates that the spheres of influence of the trust companies and banks are being gradually and definite-

Digitized by Google

ly established. It is particularly so since the big twelve of the 31 trust companies throughout the country have adopted a policy of according better treatment to trusts of longer terms.

Mutual Loan Companies (Mujin Kaisha)

In addition to the banking institutions there are mutual loan companies (Mujin Kaisha), which are credit establishments peculiar to Japan and are based on mutual credit among the middle and lower classes of people. Mutual credit societies have existed in Japan since olden times. The Mutual Loan Society Law was promulgated in June, 1915, whereby the mutual loan societies acquired a legal standing. But in order to enable these societies to perform the function of financial institutions for lower classes and to extend their business operations, fundamental amendments were made in the law in 1931. According to the provisions of the Mutual Loan Company Law, put into effect on and after July 1, 1931, the business of the companies is to make the subscribers pay money in instalments during a fixed period and then to distribute it, in lots, among the subscribers, by drawings, biddings or some similar means, the number of such lots and the sum of money to be thus distributed being previously fixed. Each company must have a nominal capital of more than ¥30,000 and a paid-up capital of more than ¥15,000. No company is allowed to carry on this kind of business without permission of the Minister of Finance. Those so engaged are prohibited from carrying on any other business at the same time and are under obligation to present business reports to the Government. Restrictions also are put on the use of business funds.

The total amount handled by these mutual credit societies throughout the country is given as between ¥3,000,000,000 and ¥4,000,000,000 and members of the societies are said to number some 4,000,000 persons. Many prefectural governments have issued decrees controlling the societies with a view to preventing evil practices.

Co-operative Credit Associations

Credit Associations acquired a legal standing under a new system as defined by the so-called Co-operative Association Law, promulgated in March, 1900. The business of these associations is to lend money to their members in order to better their economic conditions and to employ their savings. By virtue of the revision of the law in July, 1917, the business of the Credit Associations has been expanded and they may use the savings of the families of their members, public corporations or legal persons who do not aim at profit. Especially, the Credit Associations in cities or city areas designated by the competent Minister of State may, besides the business above described, discount bills for their members and handle savings of persons who are not their members but reside inside the same boundary. Therefore, they may be called the People's Banks in city areas, and are placed under the control of the Minister of Finance and the Minister of Agriculture and Forestry. The actual number of these associations was 274 at the end of December, 1937.

Central Chest for Co-operative Associations

(Sangyo Kumiai Chuo Kinko)

As an institution for regulating the movement of funds of the Federations of Co-operative Associations and of individual Co-operative Associations and for bringing them into close touch with the central money market, the Central Chest for Co-operative Associations was established by law on April 5, 1923. Its capital at present amounts to ¥30,700,000, of which ¥15,000,000 is invested by the Government and the remainder, ¥15,700,000, by the Co-operative Associations throughout the country. The Associations that participate in the investment amount to more than 80 per cent of the total number existing. The principal business of the Central Chest for Co-operative Associations is as follows:

(1) To make without security loans redeemable at a fixed time within a period of not more than five years to Federations of Co-operative Associations or Co-operative Associations;

(2) To make loans without security redeemable by annual instalments within a period not exceeding thirty years to the Federations of Co-operative Associations or Co-operative Associations, provided that the total amount of such loans does not exceed one-half of the paid-up capital and debentures issued;

(3) To discount bills for, or allow overdrafts to, Federations of Co-operative Associations or Co-operative Associations;

(4) To undertake exchange business for Federations of Co-operative Associations or Co-operative Associations;

(5) To receive money as deposits from Federations of Co-operative Associations, public corporations, or legal persons not engaged in business aiming at profit;

(6) To take securities for safe custody for Federations of Co-operative Associations or Co-operative Associations; and

(7) To buy and sell on a consignment basis securities for Federations of Co-operative Associations or Co-operative Associations.

The Central Chest is authorized to issue debentures and is subject to control both of the Minister of Agriculture and Forestry and the Minister of Finance. The assets and liabilities of these associations follow:

Clearing Houses

The establishment of the first clearing house in Japan took place in Osaka in 1879, preceding by eight years that in Tokyo, where one was established in 1887. Cash transactions marked the commercial society of this country early in the Meiji era and no transactions in bills or cheques were then conducted. Viscount Shibusawa and other business leaders encouraged paper transactions among businessmen at large and the time soon came when it was necessary for Tokyo to establish a clearing house, one being eventually brought into existence by the Bankers' Association in 1887. The first president of the institution was the late Viscount Shibusawa and the present holder of that office is Mr. Hirozo Mori, Vice-president of Yasuda Bank. At the end of 1938, there were 47 clearing houses in Japan. The total of bills cleared at the clearing-houses throughout the Empire in the year 1938 reached 47,126,000 bills and ¥86,095,000,000. As compared with the preceding year the number of bills increased by 838,000, while the amount gained was ¥573,000,000. The amount of clearings in Tokyo and Osaka and Japan proper were as follows:

BILLS CLEARED AT THE CLEARING-HOUSES IN JAPAN PROPER

Postal Savings Deposits

The postal savings deposits system of Japan was adopted from the Post Office Savings Act of Great Britain. It was established by an Imperial Ordinance of August, 1874, and was enforced in May of the following year at 22 post offices in the country. The history of this service in Japan is one of the oldest in the world, older than that of Germany or France and 36 years older than that of America. At first the annual interest rate was 3 per cent, the highest rate was 7.2 per cent during 1881-1884, but it is 2.76 per cent since April, 1937. The maximum amount one could deposit was at first ¥500. In the first year of enforcement the amount totalled ¥51,224 for 1,843 depositors. In 1882 the Mail Act was passed and the deposit business became jointly controlled by the Minister of Finance and the Minister of Agriculture and Commerce. The service was looked after by 4,000 post offices in the country. In 1890 the Postal Savings Deposit Act was issued. In 1920 the Exchange Deposit Bureau was established and was later replaced by the Deposits Bureau in the Ministry of Finance. (See Chapter VIII.)

The number of depositors and amount of savings since 1925 are as follows:

March 31,	Number	Amount
1925	30,386,806	¥1,131,250,271
1926	31,549,989	1,166,998,703

Note: Figures include Postal Transfer.

Currency System

Coinage The present coinage system is based on the Coinage Law issued in 1897, which established the gold monometallic system. Its principal points are summarized as follows:

(1) The coinage unit is 2 fun (0.75 grammes) of pure gold, that is, one-half of the former gold unit, and is to be denominated one yen.

(2) The standard gold coins are of three denominations, namely, five yen, ten yen and twenty yen; the former gold coins pass for double their nominal value.

(3) The subsidiary silver coins are of two denominations, namely, twenty sen and fifty sen; the former five-sen, ten-sen, twenty-sen and fifty-sen silver pieces are allowed to circulate.

(4) The other subsidiary coins are the nickel five-sen and ten-sen pieces and the bronze one-sen and five-rin pieces; the former five-sen nickel as well as two-sen, one-sen, five-rin and one-rin copper pieces are allowed to circulate.

(5) The fineness and weights of the coins prescribed in the Coinage Law are as follows:

(a) Fineness

Gold coins pure gold 900 copper 100

Silver coins pure silver 720 copper 280

Nickel coins pure nickel 1000

Bronze coins copper 950 tin 40 zinc 10

(b) Weights

Gold coins:

Denominations	Weights Grammes
20-yen pieces	16.6666
10-yen pieces	8.3333
5-yen pieces	4.1666

Subsidiary coins:

Denominations	Weights Grammes
50-sen silver	4.95
20-sen silver	1.98
10-sen nickel	4.00
5-sen nickel	2.80
1-sen bronze	3.75
5-rin bronze	2.10

Digitized by Google

Paper Notes of Small Denominations In order to make good the deficiency of subsidiary silver coins caused by the war, paper notes of small denominations, namely, fifty-sen, twenty-sen and ten-sen, were issued as a substitute in accordance with the Imperial Ordinance No. 202 promulgated on October 29, 1917. The issue of these petty notes went on increasing in volume till at the end of February, 1922, it reached 218 million yen, the largest on record. After that time the volume gradually dwindled in consequence of the minting of new subsidiary coins to displace the notes, the latter coming down, by the end of December, 1937, to ¥10,965,000, consisting of ¥5,345,500 50-sen notes, ¥1,095,900 20-sen notes and ¥4,523,600 10-sen notes.

Emergency Currency Not only to effect economy, for the time being, in the use for monetary purposes of some metals as provided for in the Coinage Law, but to meet the increasing requirements for subsidiary coinage, emergency currency was issued in accordance with the provisions of the Emergency Currency Law promulgated in June, 1938. It consists of subsidiary coins of 10-sen, 5-sen and 1-sen, and of paper notes of small denomination of 50-sen.

The fineness and weight of these subsidiary coins are specified by Imperial Ordinance No. 388 of 1938 as follows.

A. Fineness.

10-sen piece aluminium	50 copper	950
5-sen piece aluminium	50 copper	950
1-sen piece copper	900 zinc	100

B. Weight.

	Grammes.
10-sen piece	4
5-sen piece	2.8
1-sen piece	3.75

Convertible Bank Notes In May, 1884, there was promulgated the Convertible Bank-notes Law providing for the issue by the Bank of Japan of bank-notes which were to be converted into silver, but on the adoption of the gold standard in 1897 these notes became convertible into gold. Certain amendments were made in the law in June, 1932 and 1938. The principal points may be summarized as follows:

The Bank of Japan is required to hold as a conversion reserve against the issue of notes gold and silver coins and bullion to the same amount as that of the notes issued; and the total value of silver coins and bullion must not exceed one-fourth of the entire conversion reserve. The Bank of Japan may, in addition to the notes specified in the preceding paragraph, issue bank-notes to the amount of ¥1,700,000,000 against Government bonds, Treasury notes and other reliable securities or commercial bills. The Bank may also be allowed to issue notes against such securities beyond the maximum mentioned above. In case the issue in excess of this limit lasts more than 15 days the approval of the Minister of Finance is required, and such issues outstanding after a period of 15 days are subject to a tax of at least 3 per cent per annum of the amount so issued. The bank-notes are of 7 denominations, namely, one yen, 5 yen, 10 yen, 20 yen, 50 yen, 100 yen and 200 yen.

Currency System of Formosa and Korea As regards the currency system of Formosa, up to October, 1908, recognition was given to the circulation at the market price in gold of the silver yen, similar to that in circulation in Japan proper until the revision of the Coinage Law in 1897; but the exchange of silver was brought to a conclusion at the end of April, 1909. In April, 1911, the Coinage Law of the Empire was brought into operation in the island, so that the system in Formosa is now absolutely identical with that in force in Japan proper. The Bank of Taiwan issued, at first, bank-notes convertible into silver yen, but these notes were, upon the reform of the currency system, withdrawn from circulation by April, 1909. In June, 1904, the bank was allowed to issue bank-notes convertible into gold coins, holding as conversion reserve gold and silver coins and bullion to the same amount as that of notes issued. It may further issue notes to the amount of ¥50,000,000 on security of reliable securities. Should it be necessary to issue notes over and above the amounts just mentioned, the permission of the Government must be obtained and an issue-tax of at least 3 per cent must be paid in respect of the excess issue.

The currency system of Korea had fallen into such a state of disorder and confusion that confidence in legal tender was entirely gone, and consequently commodity prices perpetually fluctuated. In 1905, at the time of the protectorate régime of Japan, a radical reform of the system was started, the coinage regulations were revised and new coins equal in quality and weight to those of Japan were minted. At the same time, the use of the old nickel coins was prohibited as from December 31, 1909. After the annexation (1910), in order to have a uniform currency throughout the Empire, the minting of

Digitized by Google

coins under the Coinage Regulation was suspended and the circulation of Japanese coins was encouraged; the old Korean coins in circulation steadily diminished. The Imperial Coinage Law was put in force in April, 1918 in Korea and the use of the old Korean coins as legal tenders was permitted till the end of 1919 only, the Government undertaking to exchange them during the five subsequent years. The use of "Yo-sen" (bronze pieces), however, was left free for the time being in consideration of economic conditions in Korea. Bank-notes issued by the Bank of Chosen are convertible notes. Besides issuing under the Charter of the Bank of Chosen against the security of gold specie, gold and silver bullion and Bank of Japan's convertible notes, the Bank is authorized to issue notes up to the limit ¥100,000,000 on the security of exchequer bills and other reliable bills or trade bills. The Emergency Currency Law was put into operation in Chosen as from June 1, 1938.

Foreign Exchange

While every field of financial transaction in this country was affected by the enforcement of the wartime system in 1937, the one which probably reflected the extraordinary situation in the most direct manner was foreign exchange. Compared with the wide fluctuations which occurred between 1930 and 1933 on account of the removal of the gold embargo and the re-imposition of the ban and the prevalence of the panic in the United States, the exchange rates of the yen were outwardly stable during the year. In fact, however, numerous unfavourable factors prejudicial to the exchange rates of the yen had piled up, such as the strengthened exchange control, the shipments of gold and the co-operation of exchange banks in the execution of the national policy under the wartime system.

Digitized by Google

Rate at 1s. 2d. In view of the prevailing economic conditions, the Government decided as a national policy to maintain the exchange rate of the yen at the level of 1s. 2d. This decision was based on the following views :

1. A fall in the exchange rate would stimulate a further rise in the prices of commodities, which in turn would tend to lead to inflation and the resultant evils ;

2. As Japan has to look to the various foreign countries for the supply of a large quantity of materials required for the perfection of her national defence and the expansion of her productive capacity, a fall in the exchange rate would reduce the purchasing power of the yen and thus render it difficult to operate the budget ;

3. A fall in the exchange rate would not serve to increase the volume of the export trade of the nation because the relations of international economy are no longer based on the principle of free trade.

The first expression of the policy of maintaining the exchange rate of the yen at the level of 1s. 2d. took the form of the promulgation, on January 8, of the import exchange license system. The licensing system was extended on July 7, when the exemption point for such license was also lowered and the control over exports without bills of exchange was strengthened. Again on August 28, regulations were promulgated for the enforcement of a control over imports without bills of exchange. December 11 witnessed a further lowering of the exemption point of the import exchange license.

Import Exchange License System The enforcement of strengthened control over exchange in the form of the adoption of the licensing system for exchange transactions involving more than ¥30,000 a month was intended principally to prevent speculative imports during the first half of 1937 and not to restrict imports based on normal demand. An explanation to this effect was given by the Government at the time of the enforcement but the continued increase in the demand for commodities connected with the expansion of the productive facilities of the domestic industry and the soaring of commodity prices gave rise to fears that aggravation of the conditions of foreign trade would be inevitable. In order to cope with the situation, the authorities of the Ministry of Finance decided at a conference held toward the end of May to extend the term of the import exchange license system.

Under date of July 7, the Ministry of Finance revised the ordinance in regard to the import exchange license system and the Foreign Exchange Control Law. The former concerned the lowering of the exemption point for import license from ¥30,000 to ¥1,000 a month while the latter made the following compulsory :

1. The approval of the Minister of Finance for the remittance of dividends and profits to rightful persons living abroad ;

2. A license for remittances made in fulfilment of obligations arising from domestic or foreign ordinances ;

3. A license for remittances to be made for the use or acquirement of patent rights or other industrial rights ;

4. A license for sums upward of ¥5,000 a year employed in exchange transactions for the acquirement of foreign currency or credit or used by persons going abroad or sent to travellers or residents in foreign countries ;

5. A report to the customs authorities on exports, whether with or without bills of exchange, and matters relating to them ;

6. A license for exports without bills of exchange which are assigned to the payment of proceeds from the sale of goods imported without bills of exchange ;

7. The certificate of foreign exchange banks to the effect that their clients involved in the transactions mentioned in Ordinance No. 7 of the Ministry of Finance have obtained the necessary license or that their clients in the same transactions need not obtain a license, as the case may be.

While the licensing system for import exchange was extended and the control over general exchange transactions and exports without bills of exchange was strengthened, the authorities of the Ministry of Finance felt the need for control of imports without bills of exchange as well. This view was based on three points. In the first place, there was no means of controlling imports made by the utilization of funds held abroad, in spite of the operation of the import exchange license system. Secondly, the control over exports without bills of exchange could not be enforced satisfactorily because those foreign firms making imports without bills of exchange might make exports in return for the proceeds from the sale of such imports. Thirdly, there was no means of controlling the use of the proceeds from the sale of commodities imported without bills of exchange in covering the expenses for

Digitized by Google

building and repair works or the payment of dividend.

Accordingly, the Ministry of Finance revised its Ordinance No. 1 of 1937 and promulgated a licensing system for imports without bills of exchange under date of August 28. Explaining their attitude toward the enforcement of this system, the authorities of the ministry gave an explanation to the following effect :

1. The license for imports without bills of exchange will be issued on the basis of the same principle that the license for import exchange is issued. Accordingly, it will be difficult to import commodities not in urgent demand even if no exchange bills are involved.

2. Special considerations will be given to imports without bills of exchange in regard to munitions and raw materials.

3. Special considerations will also be given to imports without bills of exchange in regard to the staple products and key merchandise of Manchoukuo.

Control of Assets Held in Foreign Countries The Foreign Exchange Control Law was revised in September, 1937, whereby a license was made necessary for the acquirement and disposition of material assets and rights or obligations represented in Japanese currency in foreign countries. Hitherto, it had been possible for the Government to control only the acquirement or disposition of obligations represented in foreign currency by Japanese residents in foreign countries. Under the old rule, it was possible for creditors and debtors to make arrangements for representing their rights and obligations in Japanese currency as a means of avoiding mobilization. It was to prevent such practice that the foreign exchange control was strengthened. The revision also was aimed at the following points :

1. To make it possible to mobilize assets held in foreign countries in foreign currency and property, to hold credits in foreign currency, as well as to deal in foreign currency bonds, foreign exchange and foreign currency.

2. To make it possible to control the acquirement or disposition of property in foreign countries, in addition to the acquirement or disposition of credits represented in foreign currency, foreign currency bonds, foreign exchange and foreign currency.

3. To make it possible to examine or demand a report on matters concerning the aforementioned disposition.

Further Lowering of Exemption Point for Import Exchange License Through the revision effected on July 7, the exemption point for import license was lowered from ¥30,000 to ¥1,000 a month but indications were that the practices for the evasion of the law were being actively followed. This, coupled with the increased need for the restriction of the importation of commodities not in urgent demand from the standpoint of adjusting international accounts under the wartime system, led the Ministry of Finance to revise its ordinance to lower the exemption point to ¥100 a month on December 11.

Shipments of Gold The policy of the Government to maintain the exchange rate of the yen at the level of 1s. 2d. under all circumstances was clarified through the enforcement of the import exchange license system on January 8 and it was stressed as forming one of the three basic principles for the conduct of financial and economic affairs by the Hayashi and Konoé Cabinets. The import of commodities inevitable for the expansion of the productive capacity of the nation under the wartime system, however, steadily aggravated the balance of international accounts in spite of the restrictions put on general imports by the import exchange license system. As a means of coping with the situation, the Government finally decided to make gold shipments to meet the emergency requirements.

The first shipment of gold for the said purpose was made on March 9 and by July, the gold shipments to the United States and England totalled ¥307,000,000. And yet there was no sign of improvement in the balance of international payments. Feeling it dangerous to continue making gold shipments without a more definite basis, the authorities created a special account of gold funds on August 25, besides carrying out a re-assessment of the gold reserves of the Bank of Japan. The creation of the special account chiefly concerns the purchase and shipment of gold, and has in view the following two major points :

1. In order to increase their effect, operations for the maintenance of the exchange rate of the yen shall be conducted secretly without being related to the gold reserves of the Bank of Japan. This measure aims at the elimination of such obstacles to the exchange operations as may be brought about as a result of open shipments of gold and purchases of gold.

2. Gold shipments shall be limited to the original fund (transferred from the proposed account of the Bank of Ja-

Digitized by Google

pan) included in the special account of gold funds and the new production of gold. This measure aims at the prevention of negligence in regard to facilities and endeavours such as might arise from continuing gold shipments without a definite basis.

On account of the operation of the new system, gold shipments made since August have been kept entirely from public knowledge.

Foreign Exchange Control Law

It was after the coming into operation on July 1, 1932 of the Capital Flight Prevention Law enacted with the object of controlling movements of capital in and out of the country that the flight of capital through purchases and sales of exchange, remittances to foreign countries, or investments in securities in foreign currencies was prevented almost completely. Subsequently, however, the world economic situation developed so adversely that it seemed impossible to protect the economic life of the nation by resorting to control under the Capital Flight Prevention Law only. In view of this fact and in order to enlarge the scope of control over the flight of capital and to prohibit speculative dealings in foreign exchange, the Government submitted to the Diet in the 64th session a bill for the control of foreign exchange. With the coming into operation on May 1, 1933 of the Foreign Exchange Control Law that had thus passed the Diet, the Capital Flight Prevention Law was abrogated. Amendments were, however, made in this Law on two occasions in 1937.

The Foreign Exchange Control Law, the principal object of which is to prevent completely the flight of capital and speculative dealings in foreign exchange and to check abnormal fluctuations in the yen exchange, vests the Government with the following authority to control, in case of necessity, such transactions or acts as will be mentioned below through the Ordinance of

Digitized by Google

the Department of Finance.

(1) Authority to restrict or prohibit the following transactions or acts:

(a) Acquisition or disposal of foreign currencies or foreign exchange.

(b) Export of currency, gold bullion, gold alloys or gold manufactures, or the melting down or mutilation of gold coins.

(c) Remittances to foreign countries by means other than those included in (a) and (b) above.

(d) Payment in Japan by order from a foreign country.

(e) Fixing of foreign exchange quotations.

(f) Acquisition or disposal of securities, claims or obligations expressed in foreign currencies.

(g) Acquisition or disposal of claims or obligations expressed in Japanese currency to persons residing in foreign countries.

(h) Issue or acquisition of letters of credit.

(i) Granting of credits to persons residing in foreign countries.

(j) Export or import of securities.

(k) Export or import of merchandise unaccompanied by exchange transactions.

(l) Acquisition or disposal of assets in foreign countries other than those mentioned in (a), (f) and (g) above.

(2) Authority to require reports or to make examinations in respect of the matters relating to the above prohibitions or restrictions or matters mentioned in (4) below.

(3) Authority to limit transactions in foreign exchange to cases in which one of the parties to the transactions is the Bank of Japan or such other person as the Government may designate.

(4) Authority to require persons in possession of the following assets to sell them to the Bank of Japan or such other person as the Government may designate, or to require such persons to make necessary disposal relating to such assets:

(a) Gold bullion, foreign currencies, or foreign exchange.

(b) Securities or claims expressed in foreign currencies, or claims expressed in Japanese currency to persons residing in foreign countries.

(c) Assets in foreign countries other than those mentioned in (a) and (b) above.

As in the case of the Capital Flight Prevention Law, the principle of severe punishment has been adopted in applying penal provisions to acts of violation specified in the Ordinance of the Department of Finance issued under such authority. Thus, persons contravening the prohibitions or restrictions of transactions or acts as prescribed in the Ordinance are liable to punishment by penal servitude or imprisonment for a term not exceeding 3 years or to a fine not exceeding 10 thousand yen (or not exceeding three times the value involved in the transaction in question in case three times the value of said transactions exceeds 10 thousand yen), and persons not presenting reports or obstructing the examination of books and other documents are liable to imprisonment for not more than 6 months or a fine of not more than 5 thousand yen.

The Government established the Foreign Exchange Control Bureau in the Department of Finance as an execution organ of the Foreign Exchange Control Law. It has also created two such committees as the Foreign Currency Valuation Committee and the Foreign Exchange Control Committee, the former being authorised to fix the sale price in cases where the Government may, in accordance with the provisions of this Law, require the sale of gold bullion and assets expressed in foreign currencies and the latter acting in consultation with the competent Minister on important matters relating to the enforcement of this Law.

Such authority as has been vested in the Government under the Foreign Exchange Control Law does not operate in all cases. The scope of transactions or acts to be prohibited or restricted and the manner of control are, therefore, provided for in detail in the Ordinance of the Department of Finance issued in accordance with this Law (The Ordinance came into force as from May 1, 1933, the date of the coming into operation of the Foreign Exchange Control Law). Several amendments have been made in this Ordinance since its promulgation, the most important amendments having been made on November 27, 1936, and put into effect as from December 1; on December 11, 1937 (effected on the same day, except for certain provisions) and on October 8, 1938 (effected on the same day, except for certain provisions which were put into operation as from October 15, 1938.) The contents of the Ordinance may be summarized as follows:

(A) Matters prohibited.

(1) The melting down or mutilation of gold coins is prohibited.

(2) Except as necessary for commercial transactions or other actual demands, speculative transactions in ex-

Digitized by Google

change are prohibited. The operations to be controlled under this provision are speculative purchases and sales of foreign currencies, of foreign exchange (drafts, checks, mail transfers, telegraphic transfers and postal transfers, whether drawn in Japan on a foreign country or in a foreign country on Japan), and of yen exchange as between foreign countries.

(B) Matters restricted.

In cases where the following transactions or acts are carried out, permission of the Minister of Finance is in principle required, except as specially provided for:—

(1) Gold.

(a) Export of gold coins, gold bullion, gold alloys, or gold manufactures.

(b) Melting down of gold coins.

(2) Currency and foreign currencies.

(a) Purchase of foreign currencies against Japanese currency as counter-value.

(b) Transfer of currency or foreign currencies to foreign countries, or the carrying of such currencies by persons travelling abroad.

(c) Transfer of Japanese bank notes of denomination of one hundred yen to foreign countries or the carrying of such bank notes by persons travelling abroad.

(3) Foreign Exchange.

(a) Purchase of foreign exchange against Japanese currency as counter-value.

(b) Sale of foreign exchange to those other than foreign exchange banks against Japanese currency as counter-value, or sale of foreign exchange for counterbalancing foreign exchange purchased.

(4) Yen exchange.

(a) Purchase of yen exchange drawn on the territories in which Japanese currency has the force of legal tender.

(b) Sale of yen exchange drawn on foreign countries against foreign currencies as counter-value.

(c) Purchase of yen exchange drawn on foreign countries against foreign currencies as counter-value, as made for the purpose of counterbalancing exchange sold.

(5) Payment by order from a foreign country.

Payments in the territories where this Ordinance is in force by order from a foreign country.

(6) Remittances to foreign countries.

Remittance or carrying of currency, foreign currencies, checks or drafts to foreign countries and other categories of remittances.

(7) With respect to the transactions or acts mentioned in (2) to (6) [excluding (c) of (2)], however, no permission is required in the following cases:

(a) When it is necessary to export merchandise (excluding securities) from Japan or to import merchandise into Japan. (In the case of such import, however, permission is now required under the provisions of Ordinance No. 1 of 1937).

(b) When it is necessary to make payment of insurance under re-insurance or marine insurance contracts.

(c) When it is necessary to forward interest of government bonds, company debentures or deposits in banks or profit accruing from cash deposits in trust companies, all payable in Japan, to persons in foreign countries who have rights to receive such interest or profit.

(d) When it is necessary to deliver the funds required for the service of government bonds or company debentures payable in foreign countries within a period not exceeding 6 months to fulfil the obligations under the contracts.

(e) When it is necessary to remit expenses required for the application, request, and other procedure made in foreign countries in respect of patent rights and other industrial ownerships.

(f) When it is necessary for a person travelling abroad to carry currency or foreign currencies not exceeding the equivalent of ¥1,000 as his own travelling expenses.

(g) When it is necessary for a person travelling abroad to carry exchange and a sum involved in a letter of credit not exceeding the equivalent of ¥1,000 in the aggregate as his own travelling expenses for a period not exceeding one year.

(h) When it is necessary to remit to a person travelling abroad or a person residing abroad not exceeding the equivalent of ¥1,000 including a sum involved in a letter of credit acquired, amounts of exchange and a letter of credit carried by such person travelling abroad or residing abroad at his departure from Japan as his travelling expense, salary, allowances, school expenses and other expenses of similar nature for a period not exceeding one year, or when it is necessary for a person residing in Japan to remit to his family residing abroad a sum not exceeding the equivalent of ¥1,000 as living expenses for a period not exceeding one year.

(i) When it is necessary for emigrants designated by the competent Minister to remit the expenses necessary for their

Digitized by Google

settlement, or when remittances are made, in compliance with such emigrants' request, by companies or other corporations engaged in the work of emigration as the expenses necessary for their settlement.

(j) When funds required for undertakings or businesses in the territories in which Japanese currency has the force of legal tender are remitted to such territories by persons who have domicile, head offices, or principal business offices in Japan or in such territories.

(k) When exchange is sold, or payment is made, or exchange is purchased for payment under letters of credit issued in Japan.

(l) When the transactions or acts are made by the Government.

(m) When remittances or payments not exceeding the equivalent of ¥100 are made for a period not exceeding one year.

(8) Letters of credit.

Permission of the Minister of Finance is required for the acquisition of all kinds of letters of credit (including travellers' checks), except in the following cases:

(a) When it is necessary for the import of merchandise into Japan or into the territories in which Japanese currency has the force of legal tender. (In the case of such import, however, permission is now required under the provisions of Ordinance No. 1 of 1937).

(b) When it is necessary to export merchandise from Japan.

(c) When it is necessary to make payment of insurance under re-insurance and marine insurance contracts.

(d) In certain cases, for instance, in the case of a journey, there are some matters for which no permission is required.

(9) Securities.

(a) Export and import of securities (Japanese or foreign Government bonds, company debentures, and shares, or coupons attached to such bonds and debentures).

(b) Acquisition of foreign currency securities (Japanese or foreign government bonds, company debentures, shares, or coupons attached to such bonds and debentures, all expressed in foreign currencies, including registered bonds, company debentures or shares in foreign currencies).

(c) Disposal of foreign securities expressed in foreign currencies.

(10) Deposits and loans expressed in foreign currencies.

Conclusion of contracts of deposits or loans made in Japan to acquire claims or obligations expressed in foreign currencies.

(11) Acquisition of claims expressed in foreign currencies.

Acquisition of claims expressed in foreign currencies (excluding foreign exchange and foreign currency securities) against Japanese currency as counter-value.

(12) Conclusion of contracts of trust and insurance expressed in foreign currencies.

Conclusion in Japan of contracts of trust and insurance (excluding re-insurance and marine insurance) to acquire claims or obligations expressed in foreign currencies.

(13) Borrowings and security.

(a) Issue of local government bonds or company debentures expressed in foreign currencies.

(b) Making in foreign countries of loans expressed in foreign currencies on the security of assets held in Japan.

(c) Making of loans expressed in Japanese currency from persons residing in foreign countries on the security of assets held in Japan.

(d) Offering security to the obligations of persons residing in foreign countries.

(14) Assets held in foreign countries.

(a) Acquisition of real estate, mining rights, deforestation rights, or industrial ownership, or vessels of foreign nationality held in foreign countries.

(b) Disposal of assets held abroad for the purpose of investment in foreign countries or for taking over undertakings, or investments.

(c) Disposal of assets held abroad for the purpose of investment in Japan, or for taking over undertakings, businesses, or investment in Japan, or for the purpose of acquiring assets held in Japan.

(15) Exports unaccompanied by exchange transactions.

(A) Export of merchandise for the value of which foreign exchange has not been sold to foreign exchange banks. In the following cases, however, no permission of the Minister of Finance is required:

(a) When merchandise is exported to the territories in which Japanese currency has the force of legal tender.

(b) When merchandise is exported as samples or as donations to other persons.

(c) When merchandise is exported for sale on a consignment basis, or when merchandise imported for sale on a consignment basis is shipped.

(d) When payment for export merchandise has already been received in

Digitized by Google

Japan from foreign countries, before its shipment, or when merchandise is exported in exchange for other merchandise for which payment has already been received in Japan from foreign countries.

(e) When there is a contract that payment for exported merchandise is received in Japan from foreign countries within a period of two months after the exportation of such merchandise.

(f) When merchandise, the price of which is fixed after inspection at its destination, is exported.

(g) When merchandise valued at a sum not exceeding the equivalent of ¥20,000 for a month is exported and the payment for such merchandise is transferred to Japan immediately after such payment has been collected under the bill for collection.

(h) When merchandise is exported by the Government, or when merchandise of not more than ¥100 is exported.

(B) Persons who have exported merchandise or securities for the value of which foreign exchange or yen exchange drawn on the territories in which Japanese currency has the force of legal tender has not been sold to foreign exchange banks, or persons who have a right to receive in foreign countries payment for such merchandise or securities are required to take procedure to have the proceeds transferred to Japan within five months after their arrival at destination, excepting such portions as have been used in necessary disbursements in connection with such merchandise or securities, or such portions as have been applied to payment for merchandise imported into Japan. (It should, however, be noted that in cases where the proceeds are applied to payment for merchandise imported into Japan, permission of the Minister of Finance is now required under the provisions of Ordinance No. 1 of 1937.)

These are the outlines of the Ordinance of the Department of Finance No. 7 of 1933 (as amended) providing for matters for which permission of the Minister of Finance is, or is not, required. There are also many provisions relating to foreign exchange banks and dealers in money exchange.

(16) Foreign exchange banks.

(a) Banks intending to carry on, as from December 1, 1936, the business of foreign exchange in the offices that have already been in existence or newly established are required to obtain permission of the Minister of Finance.

(b) Banks which have notified the Minister of Finance, before November 30, 1936, of the offices which carry on the business of foreign exchange and those which have subsequently been permitted by the same Minister to inaugurate the business of foreign exchang are known as foreign exchange banks.

(c) When foreign exchange banks discontinue the business of foreign exchange in their offices or change the names or places of their offices, notification must beforehand be made to the Minister of Finance.

(d) Greater freedom of the regular exchange transactions or acts is allowed to foreign exchange banks. (In this case, however, permission is now required under the provisions of Ordinance No. 1 of 1937).

(e) In cases where foreign exchange banks become one of the parties to the exchange transactions or the acquisition of letters of credit, they are required to ascertain the legality of their customers' (including banks) transactions or acts.

(17) Dealers in money exchange.

(a) Persons (excluding banks) who make it their principal business to buy and sell foreign currencies are required to notify the Minister of Finance, before December 31, 1936, of the offices which carry on such business.

(b) Persons intending to carry on, as from December 1, 1936, the business of buying and selling foreign currencies are required beforehand to notify the Minister of Finance of their intention to carry on such business.

(c) Persons who have thus notified the Minister of Finance of their intention to carry on the business of buying and selling foreign currencies are known as dealers in money exchange. Such persons, when changing their offices or discontinuing the business, are required beforehand to notify the Minister of Finance thereof.

(d) No permission of the Minister of Finance is required in cases where dealers in money exchange make purchases of foreign currencies or travellers' checks expressed in foreign currencies in the course of their business. (Under the provisions of Ordinance No. 1 of 1937, however, permission is now required for their purchase of foreign currencies or travellers' checks expressed in foreign currencies. Sales of such currencies or checks are free under Ordinance No. 7 of 1933 (as amended), but the Ordinance No. 1 of 1937 provides for the permission for sales of such currencies or checks made as from October 15, 1938).

Digitized by Google

(e) Dealers in money exchange, when selling foreign currencies or travellers' checks expressed in foreign currencies, are required to ascertain the legality of their customers' transactions or acts.

C. Reports.

(1) Persons, who have carried out such transactions or acts mentioned in B above, are required in principle to make reports to the Minister of Finance not later than the fifteenth day of the following month, except in certain special cases. Persons who export gold and merchandise for the value of which foreign exchange has not been sold to foreign exchange banks are, however, required to submit, in making reports of such export to the customs house or in the event of despatch by mails, reports relating thereto through the customs house or the post office of despatch. With respect to the report of the exports for the value of which foreign exchange has not been sold to foreign exchange banks, there are detailed provisions.

(2) Persons who export merchandise for the value of which foreign exchange or yen exchange drawn on the territories in which Japanese currency has the force of legal tender has been sold to foreign exchange banks are required to submit, in making reports of such export to the customs house or in the event of despatch by mail, reports relating thereto through the customs house or the post office of despatch.

(3) Persons travelling abroad, who carry currency or foreign currencies, are required, at their departure, to make reports through the customs house.

(4) Foreign exchange banks are required to submit, not later than the fifteenth day of the following month, detailed statements for each month of purchases and sales of foreign exchange, purchases and sales of yen exchange drawn on the territories in which Japanese currency has the force of legal tender, bills for collection handled, payment of remittances from foreign countries, letters of credit issued, and the like. (This applies correspondingly to banks other than foreign exchange banks).

(5) Dealers in securities are required to submit, not later than the fifteenth day of the following month, detailed statements for each month of purchases and sales of foreign currency securities or of their brokerage transactions.

(6) Persons who have, in the territory where this Ordinance is in force, the mutual accounts and other counterbalancing accounts with persons residing in foreign countries are required to submit statements for each month not later than the fifteenth day of the following month.

(7) Persons, who carry on undertakings or business in foreign countries, are required to submit, in respect of their undertakings or businesses, statements of receipts and disbursements between January and June and between July and December, the conditions of remittances and movements of other funds as between Japan and foreign countries, and of assets and liabilities in foreign countries as at the end of each period.

(8) Persons who have assets in foreign countries (excluding foreign currency securities, deposits, loans, and rights to receive benefit from trust) are required, as specially provided for, to submit statements of increase and decrease in such assets as between January and June and between July and December, and of the amount as at the end of each period. In cases where the amount as at the end of each period is less than ¥10,000, no report is required.

D. Compulsory disposal of assets.

The Minister of Finance may at any time require persons in possession of the following assets to sell them to the Bank of Japan or such other person as the same Minister may designate, may require them to make necessary disposal of such assets, or may prohibit or restrict such disposal:

(1) Gold bullion, foreign currencies, or foreign exchange.

(2) Securities or claims expressed in foreign currencies, or claims expressed in Japanese currency to persons residing in foreign countries.

(3) Assets in foreign countries other than those mentioned in (1) and (2) above.

E. Impress of stamp on foreign currency securities.

Foreign currency securities, the purchase and sale of which have been exceptionally sanctioned, such as foreign currency securities which were in Japan on July 1, 1932 and those imported subsequently under license from the Minister of Finance may, as has been provided for in the Ordinance of the Depertment of Finance issued under the Capital Flight Prevention Law, be presented to the Bank of Japan and impressed with stamp.

In December, 1936, however, there was witnessed a marked increase in speculative imports of merchandise. In view of the fact that the continuance of such condition would exert an unfavourable

Digitized by Google

influence upon the future course of the yen exchange, an emergency measure was taken by promulgation of an Ordinance under the Foreign Exchange Control Law to provide for Government permission for exchange transactions necessary for payment for the import of merchandise and to prevent the undue selling of the yen exchange abroad. This Ordinance No. 1 which was put into operation as from January 8, 1937, was of a temporary nature and the period in which it was in force was to expire on July 31, 1937, but subsequent developments of the situation at home and abroad resulted not only in frequent amendments in the Ordinance, but in the date of expiration being postponed. The content of this Ordinance may be summarised as follows:

(1) Permission of the Minister of Finance is required in principle for exchange transactions and the acquisition of letters of credit necessary for the purpose of making payments for the import of merchandise.

(2) Exchange transactions controlled under this provision comprise the purchase of foreign exchange, the sale of yen exchange in foreign countries, remittance to foreign countries, payments by order from a foreign country, and the delivery of forward exchange contracts as concluded before the coming into effect of this Ordinance.

(3) No permission of the Minister of Finance, however, is required for exchange transactions or the acquisition of letters of credit in the following cases:

(a) When transactions or acts involving not more than the equivalent of ¥100 are made for a period not exceeding one month.

(b) When exchange transactions are made under letters of credit which have been acquired by permission, or without permission as specially provided for.

(4) Permission of the Minister of Finance is required in case payments for export merchandise for the value of which foreign exchange has not been sold to foreign exchange banks are applied to payment for import merchandise.

(5) Permission of the Minister of Finance is required in cases where persons who undertake the import of merchandise of foreign currency securities or deposits, advances and other assets expressed in foreign currencies, held in foreign countries, or make in foreign countries loans in foreign currencies on the security of those assets, for the purpose of making necessary payment for the importation.

(6) Permissions mentioned in (1) to (5) above must be obtained before the importation of merchandise.

(7) Permission of the Minister of Finance is required for the import of merchandise for the value of which foreign exchange or yen exchange drawn in the territories in which Japanese currency has the force of legal tender on Japan has not been sold to foreign exchange banks in foreign countries, provided, however, that this does not apply to the following cases:

(a) When merchandise is imported after permission has been obtained under the provisions in (1) to (5) above for transactions or acts necessary for payment of such merchandise.

(b) When merchandise is imported as sample, donation to other persons, or for purposes of exhibition.

(c) When merchandise shipped from Japan is sent back.

(d) When merchandise is imported for repairs.

(e) When fish caught by vessels which have gone fishing from Japan is imported in the same vessels.

(f) When hand luggages or personal belongings seperated from the owner are imported.

(g) When merchandise is imported by the Government.

(h) When merchandise of not more than ¥100 for one month is imported.

(8) Foreign exchange banks are required, as from April 5, 1938, to obtain permission of the Minister of Finance for purchases and sales of foreign exchange, remittances to foreign countries of money collected by bills for collection, payment by order from a foreign country, export of foreign currency securities for the purpose of receiving payments, the issue of letters of credit, and other transactions or acts for which a greater measure of freedom had formerly been granted only to foreign exchange banks.

(9) No permission of the Minister of Finance had formerly been required under the Ordinance No. 7 of 1933 (as amended) for the purchase and sale of foreign currencies or travellers' checks expressed in foreign currencies made by dealers in money exchange. Under the provisions of Ordinance No. 1 of 1937, however, permission is required for such purchases and sales.

It should, moreover, be noted that this Ordinance also provides that foreign exchange banks, when dealing with their customers, should ascertain the legality of the customers' exchange transactions and acts.

CHAPTER X

COMMERCE AND INDUSTRY

Number of Companies

There were a total of 85,042 companies throughout the country at the end of 1937, which showed a decrease of 2,469 or 2.8 per cent from similar figures recorded one year before. The increasing tendency of companies during the past 11 years is illustrated by the following figures :

	Number of Companies	Index No.	Increase Over Preceding Year	Percentage of Increase
1927	38,516	100	2,448	6.8
1928	41,702	108	3,186	8.3
1929	46,692	121	4,990	12.0
1930	51,910	135	5,218	11.2
1931	57,226	149	5,316	10.2
1932	65,041	169	7,815	13.7
1933	71,196	185	6,155	9.5
1934	78,198	203	7,002	9.8
1935	84,146	218	5,948	7.6
1936	87,511	227	3,365	4.0
1937	85,042	221	-2,469	- 2.8

Kinds of Companies

Of the 85,042 companies, 16,387 were Gomei Kaisha (unlimited partnerships), 42,354 were Goshi Kaisha (limited partnerships), 26,266 were Kabushiki Kaisha (join stock companies), 31 were Kabushiki Goshi Kaisha (joint-stock limited partherships) and 4 were Sogo Kaisha (mutual companies). The number of Gomei Kaisha decreased by 1,144 as compared with that recorded a year ago. The number of Goshi Kaisha also decreased by 2,832 and that of Kabushiki Goshi Kaisha decreased by 7, while that of Kabushiki Kaisha increased by 1,514.

GOMEI KAISHA

	Number of Companies	Index No.	Increase Over Preceding Year	Percentage of Increase
1927	5,961	100	459	8 3
1928	6,458	108	497	8.3
1929	7,379	124	921	14.3
1930	8,525	143	1,146	15.5
1931	9,673	162	1,148	13.5
1932	10,925	183	1,252	12.9
1933	12,344	207	1,419	13.0
1934	14,357	241	2,013	16.3
1935	16,449	276	2,092	14.6
1936	17,531	294	1,082	6.6
1937	16,387	275	-1,144	- 6.5

GOSHI KAISHA

	Number of Companies	Index No.	Increase Over Preceding Year	Percentage of Increase
1927	14,550	100	1,706	13.3
1928	16,971	117	2,441	16.8

1935	23,364	129	1,287	5.9
1936	24,752	138	1,488	6.4
1937	26,266	146	1,514	6.1

Capitalization of Companies

Among these companies there were 960 with an authorized capital of more than ¥5,000,000 each in 1937.

Digitized by Google

Authorized Capital (in yen)	No. of Companies	Percentage
Less than 50,000	58,213	68.5
50,000-100,000	8,760	10.3
100,000-500,000	11,938	14.0
500,000-1,000,000	2,405	2.8
1,000,000-5,000,000	2,766	3.3
5,000,000-10,000,000	421	0.5
More than 10,000,000	539	0.6
Total	85,042	100.0

Those with an authorized capital of less than ¥500,000 decreased from 81,865 at the end of 1936 to 78,911 at the end of 1937, losing 2,954 or 3.6 per cent while those with an authorized capital of more than ¥500,000 increased by 485 or 8.6 per cent, rising from 5,646 to 6,131. Further details in this connection are given in index number as follows :

INDEX NUMBER OF COMPANIES BY CAPITAL

1937	263	179	148	114	125	134	145

Kinds of Enterprises

The greater part of the companies are engaged in commerce as shown by the figures recorded at the end of 1936 which placed the commercial firms at 44,953 or 52.8 per cent of the total. Those engaged in manufacturing industry numbered 30,518 (35.9%); those in transport business, 6,440 (7.6%); those in agriculture, 1,942; those in mining, 836; and those in fishery, 353. It is to be noted in this respect that those classified under the heading of commerce include those dealing in merchandise, in warehouse business, in banking and in insurance business as well.

The following is a table showing the increasing tendency of the various companies during the past 11 years in index number :

INDEX NUMBER OF COMPANIES BY ENTERPRISE

	Agriculture	Fishery	Mining	Manufacturing Industry	Commerce	Transport

Total	16,939,713,704 (estimate)	21,700,670,605 (estimate)

Note: The amount of industrial products represents only that of the products in the private factories where more than five operatives are employed. The amount of products of household industries is estimated at 10 per cent of the factory products.

The value of gas produced is estimated at ¥200,000,000 and the wholesale amount of electricity at ¥500,000,000.

Governmental monopoly and undertakings are gaining profits of some ¥332,000,000.

When all the factory, household, and Governmental industrial products are taken into account the total amount of products in Japan proper in 1937 may be estimated at ¥27,362,000,000, or per capita production ¥384.08.

Production of Minor Factories There are in Japan great numbers of minor factories engaged in various industries where less than 5 persons are employed and which do not come under the control of the Factory Law. Accordingly, most of the industrial statistics given in the following chapters on industrial subjects are of factories where more than 5 persons are employed. The Ministry of Commerce and Industry gives statistics on more than 20 kinds of industries in which the largest numbers of such minor factories are engaged. The following table includes most of them, the production of which alone reaches nearly 7 per cent of the total production of the factories where more than 5 operatives are employed given above.

VALUE OF INDUSTRIAL PRODUCTION IN FACTORIES WHERE LESS THAN 5 PERSONS ARE EMPLOYED IN 1937

(In Yen)

	Production of the factories where more than 5 persons are employed	Production of all factories	Production of the factories where less than 5 persons are employed

Living Expenses

The following tables may give a general idea on the economic life of the people in Japan proper. So far as monthly income is concerned, the first order of the standard of economic life is occupied by officials in companies, followed by factory operatives, governmental officials, labourers in transportation business and educators in the order named. When it is seen from the money expended for daily life the salaried men are in a standard much higher than the labourers; but the difference between the two is diminishing judged from the index numbers for April, 1939. If economic margin or reserve may be surmised by the balance between income other than from salary and property in the items of income and money for deposits, etc. in the items of expenditure, officials in companies are best off leaving a balance of ¥14.23, next come factory operatives with ¥11.50, followed by governmental

Digitized by Google

officials, labourers in transportation business and educators in the order named. But in the case of salaried men pensions and special allowances must be taken into consideration. Farmers are the poorest with monthly income of ¥70.

MONTHLY LIVING EXPENSES OF OFFICIALS AND LABOURERS IN JAPAN PROPER

(Investigations made by the Bureau of Statistics on the monthly incomes and expenses of the representative families of each group during the 12 months from September, 1936 to August, 1937)

Commercial and Industrial Bodies

Important Commodities Guilds At the end of 1937 there were 769 important Commodities Guilds representing 107 kinds of enterprises in Japan, a loss of 5, as compared with the previous year. Those which headed the list were textiles with 93, rice and cereals 65, lumber 50, soy and "miso" 35. Federations of these guilds numbered 22.

Industrial Guilds As the end of 1937 the number of Industrial Guilds was 1,113 representing 96 kinds of enterprises, a gain of 280 in number and 21 in kind as compared with the previous year. Cotton textiles head the list with 109 rayon come next with 102, followed by wood works with 93. There were 60 federations of these guilds.

Commercial Guilds In the same year the Commercial Guilds numbered 1,641, representing 35 kinds of commodities, a gain of 452, as compared with the previous year. Cereals and flour lead the rest with 324, followed by textiles with 102. There were 11 federations of these guilds.

Export Guilds In the same period, the number of Export Guilds was 106 representing 12 kinds of commodities, a gain of 12.

Chambers of Commerce and Industry At the end of March, 1937, there were 111 Chambers of Commerce and Industry in Japan, with the total membership of 3,913 elected by 168,831 voters, an increase of 3 in the number of chambers, 97 in members and 12,417 in votes.

Industrial and Commercial Expansion in 1938-39

At the end of the Hayashi Cabinet or toward the end of the first half of 1937 a five-year programme for the expansion of munitions industry was drawn out, according to which all the industrial facilities for the manufacture of goods necessary for defence purposes were to be expanded from 200 to 1,000 per cent with an aggregate increase of capitalization amounting to ¥9,400,000,000 by the end of the fifth year including ¥6,900,000,000 in Japan proper and Korea and ¥2,500,000,000 in Manchoukuo. The Konoé Cabinet remodelled the plan to a great extent leaving the main policy unchanged and over ten new bills were presented by the Government to the 71st, 72nd and 73rd sessions of the Diet and all of them were passed and promulgated by the end of April, 1938, while efforts were made to balance international payments and to control the relation between supply and demand of commodities in the country. As the result of these Governmental policies a radical change has been produced upon the industrial structure of the nation within the past two or three years. Capitalization was concentrated in industries most closely connected with the needs for national defence as shown in the following tables:

INCREASE OF CAPITALIZATION OF BANKS AND COMPANIES IN THE EMPIRE IN 1938

NEW CAPITALIZATION OF BANKS AND COMPANIES IN THE FIRST HALF OF 1939

(Compiled by the Industrial Bank of Japan)
(Unit ¥1,000)

Kind of Business	Stocks for New Establishments	Increase of Stocks in Old Companies	Issue of Corporation Bonds
Chemical Industry	105,102	103,980	35,000
Manufacturing Industries	262,206	498,691	40,000
Transportation	37,434	36,846	45,000
Electricity	600	2,720	82,000
Gas	80	100	0
Mining, Fisheries, Agriculture and Forestry	108,171	237,615	73,214
Insurance	0	6,400	0
Warehousing	10	50	0
Trust and Financing	3,712	1,555	100
Banking	0	0	191,565
Commerce	89,851	23,737	0
Miscellaneous	350,000	0	0
Total	957,166	911,696	466,87
Increase (+) or Decrease (−) as compared with the first half of 1938	−15,463	−178,983	+168,899

As the above table shows the capitalization for new companies decreased by 15 million yen as compared with the first half of 1938, the increase for old companies also decreased by 178 million yen, but the floatation of corporation bonds showed a remarkable increase of 168 million yen because of the better condition of the share market. The increase in manufacturing industries, mining, fisheries, agriculture and forestry is perticularly conspicuous.

At the same time the amount of decrease of the old capital was ¥181,652,000, consisting of ¥27,006,000 by the partial decrease and ¥154,646,000 by the dissolution of old companies. As compared with the first half of 1938, the partial decrease was ¥29,412,000 less and the decrease by dissolution was ¥116,509,000 less. Thus the net increase in the amount of stocks was ¥1,687,210,000 in the first half of 1939.

The following tables indicate the general trend of industrial expansion in Japan in recent years which is moving from the so-called light to heavy industries including chemical industry:

INDEX NUMBERS OF INDUSTRIAL PRODUCTION

(Compiled by the Department of Commerce and Industry)
(Base—The average of 1931, 1932, 1933=100)

Year	1932	1933	1934	1935	1936	1937	1938
Total average of manufacturing and mining industries	97.2	112.5	127.4	141.0	150.2	169.7	172.0

Note: (A) denotes a half-year period, from March to August, (B) the other half, from September to February of the following year. Profit rate means the rate of net profit against paid-up capital. These figures are obtained by averaging several representative companies for each kind of industry.

Wartime Economic Legislation

The following is an outline of the various laws enacted with a view to facilitating the necessary expansion of the productive capacity of the munitions industry :

Temporary Fund Adjustment Law This law was promulgated on September 10, 1937, as Law No. 86 and was enacted for the purpose of checking the absorption of commodities and funds by peacetime industries so as to make them available for industries directly connected with the national defence. This law deals with : (1) the adjustment of industrial funds ; (2) the extension of the issue limit of the debentures of the Industrial Bank of Japan ; (3) the issuance of savings debentures ; and (4) the investigation of banking matters.

The adjustment of industrial funds is to be effected in regard to the management of enterprises as well as of banking organs. Six ways of adjustment have been specified, namely, (1) the advancing of loans for the creation, expansion and improvement of industrial facilities, (2) the subscription and underwriting of securities and handling of affairs concerning the issuance of securities, (3) establishment of companies, increase of capitalization and amalgamation of companies or making the required changes in the objects of companies, (4) the collection of the second and later instalment payments on capital shares, (5) the creation, expansion or improvement of industrial facilities beyond the limit prescribed by decree, without resorting to the means of collecting payments on capital shares or issuing debentures for obtaining loans from banking organs, and (6) the issuance of debentures without causing others to underwrite the debentures or handle affairs concerning their issuance. In view of the requirements of the current situation, preferential right to obtain funds is given to those enterprises which are either directly connected with munitions production, or of basic importance to munitions industry and are short of industrial facilities at present or likely to be short of such facilities in the near future. At the same time, almost prohibitive restrictions are placed on the demand for funds in the case of enterprises which have a surplus productive capacity or which are engaged in the manufacture of luxury goods or such articles as are not in great demand among the general public on account of the prevailing situation.

The extension of the issue limit of industrial debentures is aimed at enabling the Industrial Bank of Japan to issue debentures to the extent of ¥1,000,000,000 instead of ¥500,000,000 as heretofore. This measure together with the provision of the said law for

Digitized by Google

the recognitions of exceptions in regard to capital increase and debenture issues of industrial companies connected with the urgent requirements of the current situation are the principal steps aimed at facilitating the supply of industrial funds for enterprises connected with munitions industry. In this connection, mention may be made of the fact that the Bank of Japan is also called upon to extend financial assistance in the promotion of the munitions enterprises.

The issuance of savings debentures is intended to absorb the smaller amounts of funds held by the general public as a means of promoting the digestion of Government bonds and to encourage the public to save their earnings. According to this provision of the law, the Hypothec Bank is able to issue savings debentures to the extent of ¥200,000,000.

Detailed regulations for the enforcement of the temporary fund adjustment law were promulgated on September 25, 1937, together with the ordinance concerning the enforcement of the law. Accordingly, all the provisions were put into effect as from September 27 of the same year.

Automobile Manufacturing Industry Law It was considered necessary to develop the automobile manufacturing industry in this country in order to facilitate and perfect the national defence and the industrial advancement of the nation. Hence the automobile industry law. Through the enactment of this law, the licensing system was enforced for the automobile manufacturing enterprises and were exempted from the income tax, the business profit tax and the import duty. The law also provides that the importation of automobiles or parts thereof may be restricted or subjected to the imposition of a special duty, when such measures are deemed necessary from the standpoint of promoting the domestic automobile manufacturing industry. The enforcement of the law dates back to July 11, 1936.

Temporary Law Concerning Restriction of Movements of Horses This law aims at facilitating the commandeering of necessary horses in connection with the China incident by putting restrictions on the movements of horses from those cities, towns and villages which are included in the plans for such commandeering to other places. It was promulgated on September 10, 1937.

Temporary Shipping Control Law Promulgated on September 10, 1937, this law aims at the general and rational management of shipping in order to facilitate the smooth transportation of commodities in connection with the China incident. It enforces a licensing system for the transfer, chartering and mortgaging of Japanese vessels, authorizes the importation of foreign vessels, controls lines and freight rates and makes stipulations in regard to the manufacture of vessels and seamen. The enforcement of this law started from September 29 of the same year.

Japan Iron Manufacturing Joint Stock Company Law This law was promulgated on April 6, 1933, with the object of consolidating the foundation of the iron industry in this country. It provides for the organization of the Japan Iron Manufacturing Joint Stock Company as a semi-governmental concern and contains regulations pertaining to the control of the Company.

Iron Manufacturing Industry Law This legislation aims at the development of the iron industry and the strengthening of the foundation of the heavy industry of the country, thus contributing to the national defence and the industrial expansion of the country. It enforces the licensing system for the iron industry and empowers the Government to grant privileges including exemption from taxes to enterprises connected with the iron industry on the one hand and, on the other hand, enables the Government to strengthen its control over the production and sale of iron and steel and restrict the exportation or importation of the metal when such is deemed necessary. The law was promulgated on August 13, 1937, and has been in force since September 22 of the same year.

Petroleum Industry Law The enforcement of the licensing system for oil-refining enterprises and oil import business is the principal aim of this legislation. It enables the Government to strengthen its control over the said enterprises and business and provides that persons who are engaged in refining oil or importing oil shall store a specified amount of oil (enough to last for six months, calculated on the basis of the annual amount of imports). Promulgated on March 28, 1934, the law has been in force since July 1 of the same year.

Artificial Petroleum Industry Law This law aims at the establishment of the artificial petroleum industry as a means of securing the supply of liquid fuel. It requires persons who are

Digitized by Google

about to engage themselves in the industry to obtain the permission of the Government and provides that the Government grant a subsidy and other privileges such as exemption from taxes, if necessary, in regard to the industry. At the same time, the law stipulates that enterprises connected with the artificial petroleum industry shall be placed under the direction and control of the Government. The law was promulgated on August 10, 1937.

Imperial Fuel Industrial Joint Stock Company Law This legislation is connected with the afore-mentioned artificial petroleum law. It provides for the organization of the Imperial Fuel Industrial Joint Stock Company with a capital of ¥100,000,000 shared by the Government and civilian circles and empowers the semi-governmental concern to take charge of the management of the artificial petroleum industry with a view to its promotion. The law was promulgated on August 10, 1937.

Alcohol Monopoly Law This law aims at the manufacture and sale of alcohol by the Government with a view to ensuring an abundant supply of alcohol to be mixed with volatile oil in conformity with the national fuel policy. It also makes alcohol used for industrial and other purposes a Government monopoly. Promulgated on March 31, 1937, the law has been in force since April 1 of the same year.

Law Pertaining to Mixing of Volatile Oil with Alcohol. This legislation created the system of mixing alcohol with volatile oil and aims at economization in the consumption of volatile oil and is also calculated to facilitate the nation to attain self-sufficiency in liquid fuel. It was promulgated on April 1, 1937.

Regulations Concerning Permission for Iron and Steel Works These regulations are contained in the Ordinance No. 24 of the Ministry of Commerce and Industry which was issued on October 11, 1937. Aimed at economizing the general consumption of iron and steel, this ordinance makes the permission of prefectural governors necessary for erecting structures using more than 50 tons of iron and steel. Prepared on the basis of the provisions of Article 2 of the Export and Import Temporary Disposition Law, these regulations were enforced as from October 20, 1937.

Regulations Concerning Restrictions in the Use of Copper. These regulations require the permission of prefectural governors for the use of more than 100 kilogrammes of copper in one building and were enforced as from November 10, 1937. Aimed at economization in the consumption of copper in view of the impotance of this metal for national defence, these regulations were embodied in Ordinance No. 28 of the Ministry of Commerce and Industry which was enacted on November 6, 1937, on the basis of the provisions of Article 2 of the Export and Import Temporary Disposition Law referred to above.

Resources Investigation Law This law was promulgated on April 12, 1929, and has been in force since December 1 of the same year. It was enacted with the object of investigating exact extent of the resources of the nation on a comprehensive scale, inasmuch as the investigations and reports coming within the scope of the Munitions Industry Mobilization Law are confined to resources and raw materials directly connected with munitions production. By means of this new legislation, the Government is able to make extensive investigations through the various Ministries as to the exact extent of the man-power and material resources which the nation can command in time of emergency, the information thus obtained being arranged and co-ordinated by the Resources Bureau, and made available in devising ways and means of supplying the shortage of resources in time of war.

Taxation Laws With reference to the taxation increase effected to raise war funds, it may be noted here that a total sum of ¥269,500,000 was calculated as obtainable during the 1937–38 fiscal year through the operation of the following five laws which were all promulgated on March 30, 1937 :

1. Temporary Taxation Increase Law ;
2. Law Pertaining to Capital Tax on Juridical Persons ;
3. Law Pertaining to Special Tax on Foreign Currency Bonds ;
4. Volatile Oil Tax Law ;
5. Law Pertaining to Tax on Transfer of Securities.

North China Incident Special Tax Law Promulgated and enforced on August 12, 1937, this law was enacted as a temporary measure to be in effect only for one year. It imposes a special tax on income, a special tax on extraordinary profits, a special tax on dividends, a special tax on bonds and debentures, and a special tax on commodities, all of which are estimated to yield a sum of ¥66,500,000 during the 1937–38 fiscal year and ¥34,900,000 during the 1938–39 fiscal year.

The operations to facilitate the diges-

Digitized by Google

tion of Government bonds are still centered on the control of industrial funds and mobilization of banking organs and as yet no legislative measures making the possession of Government bonds compulsory have been taken. The Temporary Fund Adjustment Law, as already referred-to, aims at facilitating the expansion of munitions industry by turning industrial funds toward enterprises directly connected with the national defence, while enabling the banking organs to have more money on hand for the digestion of Government bonds by restraining the demand of non-urgent enterprises for funds.

Among the various measures taken to mobilize the banking organs are the following :

a. Mobilization of the Bank of Japan : Lowering of the rate for advances on security of Government bonds from 1 sen to 9 rin for the purpose of facilitating the possession of Government bonds by the ordinary banks. Moreover, the Bank of Japan is called upon to purchase Government bonds from the member banks of the National Loans Underwriting Syndicate and other banks in case of necessity ;

b. Mobilization of special banks : Operation of the Deposits Bureau through the Industrial Bank of Japan, in addition to calling upon the Yokohama Specie Bank to refrain from absorbing call money from the ordinary banks so that the short money market may be eased.

c. Mobilization of ordinary banks and other banking organs : The removal of the need for incident bonds to be underwritten by the Bank of Japan as heretofore and the causing of the the Bank of Japan to negotiate with the National Loans Underwriting Syndicate for an increase in the amount of incident bonds underwritten by the latter and to negotiate with banks which are not members of the said syndicate, trust companies, insurance companies, and the Central Chest for Cooperative Associations for similar purposes.

The Government, on its part, adopted a policy of hastening payments as a means of facilitating an easy money market. Other measures adopted by the Government include the operation of the gold fund special accounts, operation of the Deposits Bureau and mobilization of the postal insurance special accounts for the digestion of incident bonds.

With reference to the general public, great encouragement has been given to savings and economization of consumption. Government bonds are being sold through post offices with a view to mobilizing the small amounts of funds in the hands of the general public, and popularizing the incident bonds.

The Munitions Industry Mobilization Law This law provides that the Government may, in time of war, press the labour of the people into service in the production of munitions but the nation has not yet reached a stage where it would require the application of the provisions of the mobilization law. Nevertheless, the shortage of labour, especially skilled labour, has come to be felt keenly as the expansion of the productive capacity of the nation has made progress. The China incident has intensified this need since it has given a further impetus to the expansion of the productive capacity and necessitated the calling up of a large part of labour to be pressed into service at the battle front.

In order to cope with the situation, the authorities of the Government have already taken steps to train technicians. A total sum of ¥2,020,000 was included in the additional budget for the 1937-38 fiscal year as expenses for various undertakings of the Ministry of Commerce and Industry, the Ministry of Education and the Ministry of Finnce in this connection.

The plan worked out by the Ministry of Commerce and Industry called for the creation of three State-managed institutions in Tokyo, Nagoya and Osaka to train mechanics to be assisted by 20 civilian organizations. It was calculated that through this means a total of 2,000 mechanics would be trained annually. Further, a total of 200 workers for gold mines and 400 workers for coal mines are to be trained annually at the hands of civilian organizations commissioned to perform the task by the Government.

The Ministry of Education worked out a plan calling for the training of 2,000 technicians during the latter half of the 1937-38 fiscal year in the technical schools under the management of the Government and public institutes as well as a certain number of assistant instructors and 150 high-grade seamen to be trained within 6 months.

A brief explanation of the various laws connected with the endeavours of the Government to check an evil inflation is given below :

Export and Import Temporary Disposition Law This law empowers the Government to restrict or prohibit the

Digitized by Google

export or import of specified articles in case of necessity. In case of special need, the Government is also empowered to issue necessary orders limiting or withholding the distribution, transfer, use or consumption of commodities which require to be adjusted in regard to their demand-supply relations and to issue necessary orders limiting or restraining the manufacture of articles using the aforementioned commodities as raw material. Other provisions of the law concern the issuance of orders by the Government for the presentation of reports on necessary matters and the punishment of those who have violated the law. Promulgated on September 10, 1937, this law is scheduled to be abolished within one year of the termination of the China incident.

Gold Production Law This legislation changed the system of empowering the Bank of Japan to purchase gold. Under the new rule, the Government is to purchase gold through the medium of the Bank of Japan. The law also provides for necessary matters concerning the promotion and control of the gold mining industry. It was promulgated on August 11, 1937, and enforced as from August 25 of the same year. On the basis of this law, the Ministry of Finance enacted regulations concerning the use of gold, which put a ban on the use of fine gold over 9 carats for decorative purposes. Apart from this law, the Ministry of Commerce and Industry has enacted regulations intended to encourage the production of gold.

Gold Reserve Appraisal Law and Gold Fund Special Account Law. The enactment of the appraisal law aimed at the revaluation of the gold reserves of the Bank of Japan at the rate of ¥12.93 per one momme (The original rate was ¥5 per one momme). The gold reserves of the Bank of Taiwan and the Bank of Chosen were also revalued in accordance with the provisions of the law. The special account law concerns the creation of a special account with the margin of profits accruing from the revaluation. The special account is to be operated within the limits of the budget to the extent of ¥50,000,000 for promoting the production of gold, facilitating the adjustment of foreign exchange relations and smoothing the digestion of Government bonds. Both laws came into force as from August 25, 1937.

Revision of the Foreign Exchange Control Law Law No. 81 of 1937 and Law No. 87 of 1937 were enacted by way of revising the Foreign Exchange Control Law. This revision of the foreign exchange control law was effected successively with the approval of the 71st session and the 72nd session of the Imperial Diet. The first revision inaugurated the control over imports without exchange bills while the second strengthened the control over funds held abroad. The ordinance of the Ministry of Finance issued on January 8, 1937, in regard to the import exchange licensing system was revised by another ordinance of July 7 which lowered the exemption point from ¥30,000 a month to ¥1,000 a month. This exemption point was again lowered to ¥100 a month by the ordinance of the Finance Minister which was issued on December 11, 1937, and enforced as from the same day.

Anti-Profiteering Regulations These regulations were enacted through the issuance of an ordinance of the Ministry of Commerce and Industry on August 3, 1937, which revised the previous Ordinance No. 10 of the Ministry of Agriculture and Commerce issued in 1917. Under the old ordinance, the antiprofiteering regulations concerned only 8 kinds of commodities but the number was increased to 26 under the new rule. According to the ordinance, either the Minister of Commerce and Industry or the prefectural governors are to issue warning against cornering for excessive profits or anticipating excessive profits by withholding the sale of goods. They are also to impose conditions on dealings in certain specified articles. Other provisions of the regulations refer to the making of reports on necessary matters and the punishment of those who have violated the regulations. Eight other commodities including timber were added to the list through another revision of the regulations effected on October 26, 1937.

There had been precedences for the fixing of official prices as in the case of petroleum on the basis of the Petroleum Industry Law, fertilizers on the basis of the Fertilizer Industry Law and cement on the basis of the Key Industries Control Law. The scope of such system was enlarged as a result of the outbreak of the China incident and such commodities as raw cotton, cotton yarn, cotton cloth, staple fibre and rubber which all come under the Export and Import Temporary Disposition Law were subjected to the fixing of official prices.

Control of Consumption. The policy of controlling consumption, especially

Digitized by Google

encouraging the economization of consumption, is aimed at the balancing of international accounts and the adjustment of the demand-supply relations in regard to commodities closely connected with national defence, in addition to restraining the rising tendency of commodity prices. The campaign for economization of consumption took on the shape of an appeal to the spirit of thrift among the general public and was made more effective by the imposition of increased taxes. The restriction of the importation of raw materials through the invocation of the trade control law constitutes a more direct measure of control over consumption.

Among other legislative measures of control over consumption may be mentioned the regulations concerning the mixing of staple fibre with woolen yarn and the regulations concerning the mixing of staple fibre with cotton yarn. Along with iron, copper and gold, paper is also subject to economization, the control being enforced through the manufacturing company which is monopolizing the paper industry in Japan.

Supply of Daily Necessities. Although Japan is generally self-supplied and self-sufficient in the daily necessities of her people, serious considerations had to be given to measures to prevent the decline of the productive capacity of the agricultural community which was feared on account of the decrease in farm labour brought about by the conscription. The Ministries of War, Navy, Agriculture and Forestry, Commerce and Industry, and Home Affairs have already commenced making efforts to replenish farm labour through the operation of an Agricultural Labour Replenishment Commission. The Emergency Rice Disposition Law and the Temporary Fertilizer Distribution Control Law, both passed by the 72nd session of the Imperial Diet, also aim at securing the necessary supply of provisions.

Emergency Rice Disposition Law This law, promulgated on September 10, 1937, makes reserve stocks of rice available for military consumption in connection with the China incident. It also authorizes the Government to purchase rice in accordance with the provisions of Imperial ordinance when the need arises to hold specified quantities of rice.

Temporary Fertilizer Distribution Control Law This legislation is also connected with the China incident. It authorizes the Government to make adequate dispositions in regard to the demand for, and supply of fertilizers and to regulate their prices as well as entrust their production to responsible persons. The Government is also empowered to issue necessary orders concerning the sale, use, consumption, movement, export or import of fertilizers. The law was promulgated on September 10, 1937.

Social Policy With a view to preventing the occurrence of labour disputes in this emergency period, an appeal has been made to labour organizations to cooperate in tiding over the national crisis and a ban has been proclaimed on the activities of the "Popular Front" movement. The General Federation of Labour already announced its intention of abandoning the tactics of strike in the autumn of 1937. The newly created Ministry of Welfare is now in charge of establishing and maintaining a social policy with a view to consolidating the "home front."

General Mobilization Law The wartime economic system was gradually strengthened in connection with the China incident. On February 19, 1938, the Government presented a bill providing for a law pertaining to the general mobilization of the national resources to the 73rd session of the Imperial Diet. The House of Peers gave its approval to the bill on March 24, following the example of the House of Representatives and the epoch-making legislation thus passed through the Imperial Diet without amendment.

The general mobilization law aims at the most effective display of both the man-power and material resources of the nation in time of war or during an incident of warlike nature by requiring the perfection of all necessary preparations in time of peace. It incorporates the Munitions Industry Mobilization Law as already referred-to and all the temporary legislations which were made one after another in connection with the China incident and also includes all necessary provisions concerning the perfection of the general mobilization system.

The principal feature of this legislation is to be found in the fact that it invests the Government with an extremely wide scope of powers in regard to the operation of the general mobilization system, on the ground that the conditions of war are ever-changing and cannot be exactly anticipated. The discussion of the mobilization bill at the Diet meetings was also centered

Digitized by Google

on the wide-scope authorization and arguments were advanced from the standpoint of Article 31 of the Constitution concerning the extraodinary prerogative in relations to the restriction of the rights and liberty of the people.

The general mobilization law is composed of 50 articles. Article 1 gives the definition of the general mobilization of the national resources while Article 2 stipulates in regard to the mobilization of commodities and Article 3 concerns the mobilization of enterprises. Articles 4 to 20 contain wartime provisions in regard to dispositions concerning labour, commodities, funds, establishments, land, facilities, industries, prices and publications. Articles 21 to 26 stipulate in regard to the general mobilization preparations both in time of war and in time of peace concerning the training of technicians, the maintenance of commodities, the establishment of plans and drills, experiments and researches and the encouragement of enterprises. Articles 27 to 30 concern compensation and grants while Articles 32 to 49 contain penal regulations and Article 50 provides for the organization of the general mobilization council.

With reference to the central organ for the operation of the general mobilization system, the Government announced the following three points as a result of various interpellations made in the course of the 73rd session of the Imperial Diet :

1. The Cabinet is the central supervising organ for the operation of the general mobiliztion law, the Prime Minister assuming the responsibility for the supervision and the Planning Board taking charge of the adjustment and unification of the general mobilization of the national resources under the direction of the Prime Minister.

2. The execution of the various matters are left in the charge of the various sections of the Government in accordance with the provisions of official regulations, the various State Ministers assuming the responsibilities for the matters coming within their jurisdiction.

3. According to the scale of war, necessary organs are to be created or expanded.

Laws Promulgated in 1938 and 1939

Laws promulgated and put into force during 1938 and the early part of 1939 are given with respective subjects concerned in other chapters.

CHAPTER XI

FOREIGN TRADE

Japan's foreign trade for the last 70 years can be divided into five periods, the first, before the Sino-Japanese War; the second, after the Sino-Japanese War to the outbreak of the Russo-Japanese War; the third, after the Russo-Japanese War to the outbreak of the World War; the fourth, the period following the World War and the fifth, the period after 1937. (For further historical explanations see the Japan Year Book, 1937, pp. 409, 410).

Foreign Trade in 1937

Foreign trade, excluding that of Chosen, Taiwan, and Nanyo, reached during 1937 a total value of ¥6,958,595,000, being made up of ¥3,175,418,000 of exports and ¥3,783,177,000 of imports. These figures, which are all the highest on record, show an increase of ¥482,442,000 or 17.9% in exports, of ¥1,019,496,000 or 36.9% in imports, and of ¥1,501,938,000 or 27.5% in the total value over the figures for the preceding year. While in 1936 the import excess remained at ¥70,705,000, it rose sharply to ¥607,759,000 in 1937, this being second only to ¥646,367,000 of 1924, the year immediately following the Great Earthquake in the Kanto districts. From an examination of this phenomenon, it will be found that the diversion of the economic structure of the country to a war-time basis arising out of the outbreak of the China incident in July, 1937, was one of the main factors contributing to the rapid growth of the import surplus, preventing the course of our foreign trade from turning to a favourable balance even at a time when, in ordinary circumstances, an export season sets in. Thus, the import excess had reached 760 million yen by the early part of September. The introduction of much stricter exchange restrictions and other measures of control, however, caused it to decline at the year-end by 150 million yen as compared with the early part of September. It would appear that the import excess in 1937 is enormous in value, but when its ratio to the total trade value is compared, it may be remarked that it is not so large. In 1905 (the Russo-Japanese War) and 1924 (the year after the Great Earthquake), the ratio of the import excess to the total trade value was 20.6% and 15.2% respectively, whereas in 1937, it was only 8.7%. In a situation under which the expansion of industrial productive capacity and the adjustment of and demand for goods were urgently needed, the appearance of such unfavourable balance of trade seems to have been inevitable.

Exports and imports of merchandise during 1937, excluding those of Chosen, Taiwan, and Nanyo, were as follows:

(In thousands of yen)

	1937	1936	Increase over 1936
Exports	3,175,418	2,692,976	482.442
Imports	3,783,177	2,763,681	1,019,496
Total	6,958,595	5,456,657	1,501,938
Excess of Imports	607,759	70,705	

Export Trade Although the rate of expansion in the export trade slowed down somewhat in the second six months of 1937, remarkable progress made in the first six months caused the value for the whole year to be raised by 17.9% as compared with the preceding year. Of the principal articles of export, those which declined in value were only vegetable oil, marine products, and refined sugar, these decreasing by 33.3%, 1.4%, and 11.4% respectively. All other articles, however, increased, and the greater increases were found in machinery and parts thereof (33.9%), cotton yarns (43.2%), iron manufactures (34.3%), rayon yarns (53.4%), paper (40.5%), wood (43.4%), wheat flour (76.5%), tea (76.5%), fish and whale oil (51.4%), and copper (53.3%). Turning to the value of the principal articles, it is to be noted that raw silk increased from ¥392,809,000 of the preceding year to ¥407,118,000 in 1937, rayon tissues from ¥149,170,000 to ¥154,860,000, and machinery and parts thereof from ¥82,054,000 to ¥109,881,000. In 1936, the exports of cotton tissues, silk tissues, and knitted goods declined in value, while in 1937 they showed increases of ¥89,474,000, ¥4,259,000, and ¥10,724,000 respectively. It may specially be noted that cotton tissues still head-

Digitized by Google

ed the list of exports, reaching ¥573,065,000. Vegetable oil, however, decreased from ¥35,496,000 to ¥23,662,000, marine products from ¥22,216,000 to ¥21,916,000 and refined sugar from ¥20,977,000 to ¥18,577,000. Speaking geographically, exports to all continents indicated increases, and those to Asia, Central America, South America, and Africa showed increases of more than 20%.

The principal exports are given below:

(In thousands of yen)

Articles	1937	1936	Ratio to Exports of 1936
Cotton tissues	573,065	483,591	118.5%
Raw silk	407,118	392,809	103.6
Rayon tissues	154,860	149,170	103.8
Machinery and parts thereof	109,881	82,054	133.9
Comestibles in tin and bottle	86,905	71,077	122.3
Silk tissues	72,286	68,027	106.3
Knitted goods	60,713	49,988	121.5
Cotton yarns	54,906	38,345	143.2
Iron manufactures	54,116	40,302	134.3
Potteries	53,971	43,548	123.9
Woollen tissues	50,082	45,956	109.0
Rayon yarns	44,803	29,173	153.6
Toys	42,295	36,459	116.0

EXPORTS CLASSIFIED BY CONTINENTS (In thousands of yen)

Continents	1937 Value	1937 Ratio to Total Exports	1936 Value	1936 Ratio to Total Exports	Ratio to Exports of 1936
Asia	1,645,915	51.8%	1,370,970	50.9%	120.0%
Europe	356,299	11.2	307,718	11.4	115.8
North America	659,601	20.8	608,857	22.6	108.3
Central America	54,885	1.7	41,241	1.5	133.1
South America	109,519	3.5	68,761	2.6	159.3
Africa	242,736	7.6	197,703	7.3	122.8
Oceania	106,463	3.4	97,727	3.6	108.9
Total	3,175,418	100.0	2,690,976	100.0	

Import Trade Of the principal articles of import, those which declined in value below the figures for the preceding year were oil yielding materials, wheat, crude sulphate of ammonium, and sugar, their rate of decrease being 2.8%, 12%, 40.5% and 10.1% respectively. All other articles, however, showed increases, and the total value of imports indicated an increase of 36.9% over the preceding year. In particular, gum and gum resins, wool, pulp for paper making, leather, phosphorite, synthetic colour showed greater increases, the rate of increase being 136%, 148.5%, 173.9%, 182.8%, 137.6% and 148.4% respectively. With respect to the value of the principal articles, it will be found that cotton in the seed and cotton ginned still headed the list of imports, their value remaining in 1937 at nearly the same as in the preceding year. Wool in-

Digitized by Google

creased from ¥200,898,000 of the preceding year to ¥298,404,000 in 1937, pulp for paper making from ¥67,107,000 to ¥116,720,000, and gum and gum resins from ¥72,957,000 to ¥99,218,000. Oil yielding materials, however, decreased from ¥44,873,000 to ¥43,612,000, wheat from ¥33,651,000 to ¥29,604,000, crude sulphate of ammonium from ¥33,930,000 to ¥20,191,000, and sugar from ¥20,928,000 to ¥18,806,000. As regards the imports from continents, it is to be noted that all, except Central America, showed increases over the preceding year, and especially those from Africa, Europe, North America and South America increased substantially, reaching 190.8%, 152.7%, 149.3%, and 144.9% of the preceding year.

The principal imports are given below:

Articles	(In thousands of yen) 1937	1936	Ratio to Imports of 1936
Cotton in the seed and cotton ginned	851,163	850,452	100.1%
Wool	298,404	200,898	148.5
Pulp for paper making	116,720	67,107	173.9
Gum and gum resins	99,218	72,957	136.0
Beans and peas	92,547	82,601	112.0
Wood	64,817	55,548	116.7
Coal	51,224	51,056	116.0
Oil cake	45,310	35,790	126.6
Leather	44,571	24,386	182.8
Oil yielding materials	43,612	44,873	97.2
Hemp, jute and other vegetable fibres	40,995	37,301	109.9
Posphorite	30,810	22,393	137.6
Wheat	29,604	33,651	88.0
Crude sulphate of ammonium	20,191	33,930	59.5
Sugar	18,806	20,928	89.9
Synthetic colour	16,928	11,404	148.4

Foreign Trade in 1938

Japan's foreign trade in 1938, including that of Japan Proper and Karafuto or Southern Saghalien, showed an export excess of 26 million yen. This represents a remarkable improvement over the similar total trade figure for the corresponding period of 1936 and of 1937 when the import excess rose to huge proportions. In 1938, the volume of foreign trade declined from the beginning of the year to July, causing serious apprehension among observers. However, after July it showed improvement.

Digitized by Google

Yet, the improvement in the trade balance is not a positive one brought about by increased exports, but rather is a negative one effected by decreased imports. This may be seen from the grand totals which were 2,689 million yen for exports and 2,663 million yen —a decrease of 15.3 per cent for exports and 29.5 per cent for imports in comparison with the preceding year. The trade balance improvement was due to the fact that imports fell off in larger measure than exports.

Foreign trade in 1938 was characterized by several peculiar features. First, her trade with the Kwantung Leased Territory, Manchoukuo and China, which is classified as trade within the Yen bloc, continued to rise despite the general downward trend of her foreign trade. In other words, whereas the exports destined for third Powers fell off seriously, those for the Kwantung Leased Territory, Manchoukuo and China rose favourably from the beginning of the year, totalling 1,165 million yen, an increase of 374 million yen or 47.2 per cent over the corresponding figures of the preceding year. In imports, trade within the Yen bloc totalled 564 million yen, showing an increase of 28.8 per cent over the similar figures for the preceding year. Moreover, the exports to these regions rose so rapidly that the export excess for the period under review showed an increase of more than 70 per cent.

Responsible factors for this favourable trend in the export trade, coming as it did after the remarkable decline witnessed after the beginning of the China Affair in July, 1937, are the increased demand for materials of production needed in 1938 for Manchoukuo's 5-year industrial development plan and the special demands to meet various needs for construction, peace preservation and military operations in China. These factors have been interwoven with speculative demands arising from anticipation of further consolidation in various control policies in Japan.

Secondly, Japan's foreign trade in 1938 was marked by a decline in transactions with the so-called third Powers, those outside of the Kwantung Leased Territory, Manchoukuo and China. That the trade with these Powers should have been extremely unfavourable is an obvious corollary to the increase in trade within the Yen bloc, inasmuch as foreign trade as a whole declined. Japan's trade with third Powers for 1938 totalled 1,524 million yen in exports and 2,099 million yen in imports, showing decreases of about 36 per cent and 37.2 per cent respectively and leaving an import excess of 575 million yen.

Thirdly, various changes were witnessed in regard to the relative proportions of different goods imported. Government control of foreign exchange and imports was strengthened after 1937 in order to make completely effective use of the capital available in view of the prevailing situation wherein the importation of war supplies and other materials needed to meet immediate requirements had to be precipitated and the importation of civilian supplies for consumption within the country and of materials for the manufacture of goods for export had to be held down. Thus, war supplies and other needed materials continued to be imported in large quantities in 1938 in increasingly larger proportions to other imports. With the exception of agricultural products, coal and fertilizers, all of these other imports declined sharply. Especially sharp was the decline in imports of cotton, wool, raw rubber and pulp, which are important materials for the manufacture of goods for export. During 1938, imports of these four items fell off by 741 million yen or 54.3 per cent as compared with the corresponding figures for 1937. This amount of decrease corresponds to 66.2 per cent of the total decrease witnessed in imports during the year.

Fourthly, the relative proportions among various items of exportation have also undergone some changes, which, however, are not so conspicuous as the changes in articles of importation. Notable among such changes is the fact that, while exports to third Powers generally are tending to decline, goods manufactured from native materials are gradually coming to be exported in larger proportions in comparison with goods for export which depend on imported materials. Another change has been in the gradual decline in the position of exports of miscellaneous goods, which had provided an impetus in promoting Japan's export trade in recent years.

That Japan's export trade with third Powers is in an unfavourable situation has already been stated. This situation may be made clearer by the table given below.

1937	—	—	353,352	—
1936	—	—	263,462	—

Causes of the Decline This decline in exports may be traced to several causes. First, the worldwide economic depression centring around the prevailing depression in the United States has been responsible in large measure for this trend.

Secondly, other causes peculiar to this country have existed. Notable among such peculiar causes is the control on foreign exchange and import trade, which has been tightened to such an extent as to make it difficult to import materials for the manufacture of goods for export, thereby making Japan's commodity prices comparatively higher than in many other countries. The boycotting of Japanese goods, which has been carried on vigorously by Chinese residents abroad, may also be considered a contributing factor here. On account of the above-mentioned difficulty in obtaining materials for the manufacture of export goods, the export trade in cotton yarn and fabrics, rayon yarn and fabrics, hosiery goods and woollen textiles, which depend largely on imported cotton, wool, pulp and such fibrous materials, declined by about 30 per cent.

It may also be pointed out that the decline in the exportation of goods manufactured from imported materials was made sharper than it might otherwise have been by such additional obstacles as the complicated procedures required for imports, the lack of smoothness in the distribution of imported materials and the conversion of some of the materials imported for the manufacture of exports to uses as materials for goods to meet domestic demands.

As regards commodity prices in Japan, investigation by the Department of Commerce and Industry reveals that wholesale prices according to the September indices for 1938 rose by a little more than 10 per cent over the corresponding period of the preceding year, those for staple goods for import and export rising by 6 per cent and a little over 10 per cent respectively during the same interval.

As for the boycotting of Japanese goods, its effect was felt most seriously in the South Seas region where Chinese residents are numerous. Boycotting of Japanese goods is also under way in some parts of the United States, Great Britain, etc. instead of being confined to the above-mentioned regions.

Moreover, these factors, which have combined to hamper Japan's foreign trade, have been, it may be conceded, further interwoven with other circumstances such as the hesitation on the part of overseas buyers of Japanese goods due to their anticipation of a lower yen in the future or their insufficient knowledge of financial and industrial conditions in this country, the insufficient supply of labour for manufacturing industries for export on account of the absorption of labour by munitions industries and other so-called "boom industries," and the lack of smoothness in the dispensation of shipping bottoms.

Digitized by Google

Counter-Measures With the general situation of Japan's foreign trade as outlined above, the Government is taking various special measures to meet immediate requirements in addition to the facilities previously provided for the purpose of promoting export trade. The wartime trade policy is aimed not so much at balancing the nation's international receipts and payments in a negative way as at increasing the power to the maximum while balancing international receipts and payments in a positive way by maintaining and promoting export trade. Such wartime measures are summarized below.

First, procedures to be gone through in obtaining import licences have been unified with the object of facilitating and speeding up procedures required for the importation of raw materials. For this purpose, a portion of the Foreign Exchange Bureau of the Department of Finance has been moved into the Department of Commerce and Industry building in order to keep the two Departments in closer contact than heretofore in coordinating procedures of granting foreign exchange licences and import licences. Further, the regulations governing import licences have been so revised as to simplify necessary formalities.

Secondly, efforts have been made to prevent conversion of raw materials imported for the manufacture of exports to domestic uses. For this purpose what is known as the link system was adopted. This system was first introduced some time ago when it was so arranged that an import licence be given for the importation of the same volume of wool as was contained in the woollen goods exported, the wool imported under this system being required to be exported again as woollen goods within a fixed space of time. This measure was primarily designed to encourage export of woollen goods. Later, with or without slight alterations, this system has been applied to cotton goods, rayon goods, brushes, manila paper and toilet soap. Another measure taken for the same purpose is known as the bonded factory system, under which system bonded factories may obtain import licences with special facility in case they desire to import materials with the object of reshipping them for export as manufactured goods.

Still another measure calculated to meet the same purpose was the creation of the foreign exchange fund, which was founded by earmarking 300 million yen out of the 800 million yen specie reserve of the Bank of Japan with a view to facilitating the financing of capital needed for the importation of raw materials for the manufacture of export goods. This fund has been made available for cases where adequate precautions are taken through the link system, the bonded factory system and other measures to prevent the conversion of imported materials to domestic uses. The issuance of what is known as "allowances" of raw materials for the manufacture of miscellaneous goods for export may also deserve cursory mention. Raw materials for miscellaneous goods for export have become the most difficult to obtain owing to the strengthened restrictions on imports, but in view of the important part these goods have been playing in Japan's foreign trade, special discretion has been shown in the procedures of exchange control in favour of the importation of raw materials for the manufacture of such goods for export. In a similar manner, special attention has been paid to the effective distribution of such materials after investigating into the industrial requirements of the prefectures interested with the aid of the prefectural authorities concerned and the Department of Commerce and Industry, in an effort to make the "allowances" of raw materials for miscellaneous goods for export as satisfactory as possible.

Further improvement is now being planned so that nothing may be left undone as regards the importation of materials for the manufacture of export goods.

Thirdly, attention is called to the rectification of high commodity prices. Any measure calculated directly to lower the prices of export goods would be open to criticism from abroad as a recourse to dumping. Therefore, efforts are being made to control general commodity prices in this country through the enforcement of regulations governing sales prices and other measures that may be deemed necessary in controlling commodity prices.

Fourthly, the existing "export compensation system" has been enlarged in scope so that the same system may be applied to goods for export to all parts of the world market and the compensation premiums be lowered, with a view to facilitating the financing of foreign trade. At the same time, it has been arranged that what is to be known as the system of compensating losses of loans advanced on exports

Digitized by Google

will be newly introduced in order to improve trade finances.

Fifthly, remedial measures have to be taken, apart from those to be worked out through diplomatic channels, in order to remove the economic pressure which has been brought to bear on Japanese goods in overseas markets. For this purpose close contact is being maintained within the various quarters concerned so as to make Government aid available for Japanese merchants in regions where Chinese residents are thriving in business and to rectify mistaken views of the Japanese situation on the part of overseas buyers with the aid of trade information agencies and other private organizations in markets where feelings unfavourable to Japan prevail or knowledge of the Japanese financial conditions is lacking.

Sixthly, exports to the Kwantung Leased Territory, Manchoukuo and China are being controlled in order not to exceed the volumes actually needed in those countries. This control is being effected through enforcement of official regulations, control of distribution and other measures, with a view to increasing the exportation to third Powers of goods manufactured out of imported materials so as to amplify the nation's power to buy from third Powers, inasmuch as the exports to the Yen-bloc countries rose amazingly during 1938.

Moreover, foreign trade among the same group of countries has to be restored to normalcy as speedily as possible. For this purpose, it is necessary to expedite operations for the development of their natural resources and promote the importation of materials from these resources into Japan. Hence, the problem of controlling exports to the Yen-bloc countries will have to be considered in conjunction with the question of how to promote import trade with these countries.

In the seventh place, other measures are being taken with the object of generally improving foreign trade. The most notable among such efforts is the organization of missions tasked with investigation of overseas markets. These groups have been sent to various parts of the world since 1937, when five of the missions toured the Near East, East Africa, West Africa and South America. The information brought back by these missions having proved considerably serviceable for the purpose of formulating Japan's future trade policy towards these parts of the world, three more similar missions were sent to India, Central America and North America respectively in September, 1938.

Another measure taken for similar purposes calls for the opening of trade facilities bureaus abroad, which were opened at 14 places in foreign countries during 1937. The number of these offices were increased by 12 during 1938 in order to make this system more widely available throughout the world.

Foreign Trade During the First Half of 1939

Imports and exports of the Empire during the six months from January to June, 1939, showed improvement as compared with the similar period of 1938. Details follow:

	Exports	Imports	Excess of Exports (+) or Imports (−)
		(Unit: ¥1,000)	
Jan.-June, 1939			
Japan Proper and Karafuto	1,454,405	1,478,380	(−) 23,975
Chosen and Taiwan	161,121	111,831	(+) 49,290
Total	1,615,526	1,590,211	(+) 25,315
Jan.-June, 1938			
Japan Proper and Karafuto	1,200,633	1,394,473	(−)193,840
Empire	1,287,801	1,483,272	(−)195,411

Increase in Exports Of the 13 leading export articles, only cotton textiles, silk textiles and toys dropped in export value from the year before.

The largest gain in the list of leading export goods was recorded by lumber shipments which increased 143 per cent to ¥44,615,000 for the half year. Machinery exports rose by 69 per cent to ¥102,047,000. Shipments of woollen textiles increased by 56 per cent. The bulk of the increase in machinery and lumber shipments were to the Yen-bloc.

The drop in cotton textile sales by 17 per cent was obviously because of the restriction on shipments to the Yen-bloc regions, but exports to the other countries from the first of this year to June 20 amounted to 993,820,000 square yards, valued at ¥157,970,000, an increase of 39 per cent in quantity and 18 per cent in value as compare with the corresponding period of 1938.

The 21 per cent decrease in the ship-

Digitized by Google

ment of toys was reportedly caused by the difficulty of acquiring materials, while the 19 per cent fall in the sales of silk textiles was attributed to a fall in foreign demand. Though the value of raw silk shipments was 10 per cent greater than during the first half of 1938, the quantity was 41,412 bales less than a year ago, amounting to but 161,568 bales.

Details of principal exports of Japan proper and Karafuto follow:

	Jan.-June (Unit: ¥1,000)	Compared with 1938
Cotton textiles	182,893	- 37,661
Raw silk	166,621	15,734

Important Foreign Trade Countries

Great Britian Early in the Meiji Era Great Britain, China, the United States and France were the most important countries for Japan's export trade. In the import trade Great Britain, China, France and the United States were the principal countries, in that order. With a rapid gain in the export of raw silk in 1879, the importance of export countries was changed to the United States, China, France and Great Britain, although no change was noted in their precedence as import countries. A change came over the precedence in import countries in 1893 and India became the largest exporting country to Japan, being followed by Great Britain, the United States and China in that order. This was due to the rapid growth of the Japanese spinning industry, for which Indian cotton was needed. But in 1937 India became the second and in 1938 the third in the order. At present Great Britain comes 6th in order of Japan's export trade and 9th in Japan's import trade. When British India is included, however, she stands next to the U.S.A. both in buying Japanese commodities and in selling her goods to Japan among third Powers.

The U.S.A. America's economic condition and her financial and tariff policy have a direct bearing on Japan's export trade and domestic economy, for Japan's trade with the United States is far in excess of that with any other country. The close Japan-American trade relations trace back to the visit of Commodore Matthew .Perry to Japan in the 6th year of Kaéi, 1853. In the early stage the trade volume was less than that of Great Britain and France, but in 1879 Japan's exports to that country gained to more than ¥10,000,000, and America became Japan's largest customer, a position she has since retained. In 1904 Japan's exports to America reached the ¥100,000,000 mark; in 1915 they amounted to ¥204,000,000, in 1919 to ¥828,000,000, and the record amount was ¥1,006,000,000 in 1925. In the following year the amount went off to ¥860,000,000, but this, as compared with the exports of ¥4,000,000 in 1874, was an increase by 215 times and was 40 per cent of Japan's total trade volume. Raw silk, silk textiles, refined tea, straw-braid, fancy mats and porcelain have been the principal exports from the very beginning. Imports from America increased in consonance with exports. In 1874 the value of imports was just over ¥1,000,000, but by 1905 this had advanced to ¥100,000,000, and in 1920 the amount set an all-time record of ¥873,000,000. The 1926 figure of ¥680,000,000 was 680 times the 1874 trade volume and was 26 per cent of Japan's total import value of that year. Imports from America consist of raw cotton, kerosene oil, wheat, machinery and iron. The most unique feature of the Japan-American trade is that the trade balance has been mostly in favour of Japan. In the last 67 years of trade relations the last 7 only, 1932 1933, 1934, 1935, 1936, 1937, and 1938 have shown a continuous unfavourable balance to Japan, before that only five out of sixty were unfavourable, 1900, 1905, 1918, 1920-1921. In 1938 the total volume of Japan-American trade comprised 25.0 per cent of the total of Japan's foreign trade in that year.

China It is only natural that Japan, with its close proximity to China, should look to that country with its population of 400,000,000 persons and rich in natural resources as a market for its products and manufactures as well as for supplies of materials for its industries. The friction between this uncontrollable demand of Japan and the growing racial consciousness of the Chinese, however, brought about various political differences, and finally led to the Sino-Japanese War of 1894, the Manchurian Incident of 1931 and the Shanghai Affair of 1932. Boycotts of Japanese goods have been frequent.

Notwithstanding these political obstacles, the trade between the two countries steadily progressed and in 1925 the trade total reached the record amount of ¥701,000,000 including ¥486,000,000 in exports and ¥215,000,000 in imports, as viewed from the Japanese side. China thus became the second largest market for Japanese goods, the development of China as an important market for Japanese goods, as achieved by that time, may be illustrated by the following table:

China's Share in Japan's Foreign Trade

	Proportion of Exports to China to Total Exports	Proportion of Imports from China to Total Imports
1894	8.0	9.9
1908	16.0	11.7
1912	21.8	8.9
1916	17.1	14.4
1921	22.9	11.9
1926	20.6	10.1

A strong anti-Japanese sentiment began to sweep China about this time and trade began to fall off until it reached its climax after the northern expedition of the Nationalist armies in 1930. An

Digitized by Google

illustration of these changes may be obtained from the following table:

	Exports to China	Imports from China
	(In ¥)	
1926	421,861,000	239,410,000
1927	334,183,000	226,034,000
1928	373,141,000	234,556,000
1929	346,652,000	209,975,000
1930	260,825,000	161,666,000
1931	143,876,000	103,749,000

Even in 1930 when the northern expedition ended in success for the Nanking Government and the movement of the Chinese for their racial resuscitation was at its zenith, Asia still held an important position as a market for Japan's principal manufactures, chiefly cotton goods, consuming 42.6 per cent of Japan's total exports of this kind. In this consumption, China and the Kwantung Leased Territory and Hong-Kong shared 24.7 per cent. Furthermore, almost all the remainder consumed in other parts of Asia was handled by Chinese traders.

The Manchurian Incident, 1931, enabled Japan to get the lion's share in the foreign trade of Manchoukuo, about 71 per cent in the imports of the new State during 1935 and 51 per cent in the exports during the same year, but on the other hand, combined with the Shanghai Affair, it intensified the anti-Japanese movement in China. Increases in China's tariffs on Japanese goods were also effected in rapid succession, thus dealing a great blow to Japan's trade with China and at the same time furnishing a chance for the United States, Great Britain and Germany to recover their commercial influence of former years in that country. But the trade relation is improving since 1936 with the increase of Japanese influence in that country as a consequence of the China Affair.

TRADE WITH CHINA AFTER THE MANCHURIAN INCIDENT

(In ¥1,000)

	Export	Import	Balance
1932	129,478	77,175	52,303
1933	108,253	113,357	5,104
1934	117,062	119,573	2,511
1935	148,788	138,817	14,971
1936	159,690	154,837	4,853
1937	179,251	143,636	35,615
1938	312,900	164,611	148,289

Note: The underlined figures under the heading of "Balance" denote excess of import while others denote excess of export.

Trade Ports

On June 2 in the sixth year of Ansei, 1859, in the latter part of the Tokugawa Shogunate régime, Yokohama, Nagasaki and Hakodaté were opened to foreign trade. On December 7 in the 3rd year of the Keio Era (1867), Kobé was similarly opened and in the first year of the Meiji Era (1868) Osaka and Niigata were opened to international trade and commerce.

In 1936 the total number of open ports in the Empire was 62, of which 44 were in Japan proper, 4 in Formosa, 11 in Korea, 2 in Karafuto and one in the Kwantung Leased Territory. They are :

IN JAPAN PROPER : Yokohama, Nagasaki and Hakodaté (all opened in 1859), Kobé (1867), Osaka and Niigata (1868), Ebisu (Sado Island) (1869), Misumi (1890), Shimizu, Taketoyo, Yokkaichi, Shimonoseki, Moji, Hakata, Karatsu, Kuchinotsu, Izuhara, Sasuna, Shishimi, Naha, Hamada, Sakai (Tottori prefecture), Miyazu, Tsuruga, Nanao, Fushiki, Otaru, Kushiro and Muroran (all in 1899), Onomichi-Itozaki (1900), Wakamatsu (Fukuoka prefecture) (1902), Suminoé and Aomori (1904), Nagoya (1905), Miike (1906), Nemuro (1910), Kagoshima (1919), Imabari and Tokuyama (1922), Hagi (1928), Uno (1930), Funakawa (1932), and Shiogama and Kamaishi (1934).

IN KARAFUTO : Otomari (1907) and Maoka (1922).

IN FORMOSA : Keelung, Tamsui, Anping and Takao (all in 1895).

IN KOREA : Jinsen, Kunsan, Moppo, Fusan, Chinnampo, Shingishu, Ryugampo, Genzan, Seishin, Joshin and Yuki (all in 1910).

IN KWANTUNG LEASED TERRITORY : Dairen (1906).

Customs Duties

It was in 1859, at the time when most of the early commercial treaties with the Western powers had been concluded, that custom-houses were for the first time established and customs duties were levied at a few open ports selected for the purpose. The customs tariff of that time was entirely determined by treaty; but the term of its operation was exceedingly short and the whole tariff was revised by treaty in 1866. This revised tariff kept our customs duties unchanged until 1899 when the treaties of commerce and navigation with the foreign powers came into operation.

The coming into effect from 1899 of the revised commercial treaties with the foreign powers made it possible to bring into operation the general tariff which, combined with the conventional tariffs newly concluded, formed the customs tariff of our country. At the same time the export duties were entirely abolished.

In 1904 the urgent needs of the extraordinary fund in connection with the war with Russia led to the imposition of a special surtax on the customs duties as well as on the other taxes, and soon after the restoration of peace the entire customs tariff was revised and came into operation on October 1, 1906.

The Tariff Revision The Import Tariff Revision Bill passed the Imperial Diet in 1910 and was promulgated by Law No. 54 in April of the same year. The new tariff came into operation on July 17, 1911, but since then the tariff has been revised several times.

A new tariff convention was also concluded with Italy in June, 1913.

Tariff in Korea In conformity with the Imperial Declaration concerning the Annexation of Chosen in 1910, the tariff system of the former Korean Empire was left in force in the territory for ten years after the event. On expiration of the term of ten years on August 28, 1920, the tariff in force in Japan proper was applied to Chosen.

The Luxury Duties Under Law No. 24, promulgated on July 31, 1924, which regulates import duties on certain luxuries, a hundred per cent ad valorem import duty was imposed for the time being on about one hundred and twenty kinds of goods which were designated as luxuries.

A partial amendment of the import duties on luxuries was made on April 1, 1925, exempting articles imported for industrial use, materials for re-export and certain other materials from the 100% duties.

Kwantung L. T. With the object of encouraging the industries in Kwantung Leased Territory and of promoting exports to the home country, portland cement and twenty-nine other articles produced in the province were exempted from import duties by the Act of June 18, 1925.

The Revision of 1926 Although several amendments in minor details had been made from time to time, the customs tariff of the country remained practically unchanged from 1910 to 1926 when the Government introduced into the Imperial Diet a Bill proposing a general amendment embodying the following principles:

(a) Raw materials which are not produced or are scarce in this country are to be free of duties.

(b) Necessary protection is to be given to staple industries that have bright prospects for the future.

(c) Import duties are to be left untouched or are to be reduced with respect to foreign articles with which home produce is able to compete.

(d) Duties on the necessaries of daily life are to be reduced.

(e) In order to discourage consumption, high duties are to be imposed upon articles other than necessaries of daily life.

(f) The number of specific duties are to be increased and more minute classification of articles is to be made for convenience in the imposition of duties.

The Bill was passed by both Houses of the Imperial Diet without amendment, excepting the proposal concerning wheat, flour and eggs, and was put into effect on March 29, 1926.

Although not the direct object of the amendment, an increase in the customs revenue was expected as a result of the change in the rates of duties and the adjustment of the relation between specific duties and ad valorem duties in accordance with the rise of commodity prices.

Amendments During 1927 (a) Change of duties on sugar, etc.

The duties on sugar were amended on April 1, 1927. The duties on starch, butter, oxidized cobalt, oleine and cassava-root were also altered at the same time.

(b) Revision of the preferential tariff for Kwantung Leased Territory.

An amendment was made as to the articles exempted from import duties under the preference given to Kwantung L. T. by adding soy-bean oil and certain kinds of manufactured cloths to the free list. This amendment was put into effect on April 1, 1927.

Amendments During 1929 (a) Tea and

Digitized by Google

twenty other luxury articles have been exempt from the luxury import duty since March 30, 1929.

(b) Import duties on wool and liquid gold were amended, and this amendment was put into effect on March 30, 1929.

(c) Cotton yarns and other goods manufactured in Kwantung L. T. have been exempt from import duties since May 1, 1929.

(d) Abolition of exceptions in import duties applicable in Chosen.

Although the import tariff of Chosen is generally the same as that of Japan proper, there existed certain exceptions in the case of import duties on horses and four other articles. The exceptions in the case of import duties on horses and two other articles were, however, abolished on and after March 30, 1929. The exceptions in the case of salt and wood were also amended, the former being abolished on and after April 1, 1930 and the latter on and after April 1, 1932.

Amendments During 1930 A. Millet, "Kao-liang" (Andropogon vulgaris), were exempted from import duties.

B. Of cotton yarns :

(a) Special cotton yarns were exempted from import duties.

(b) The rate of import duties on cotton yarns gray, single or two fold, with the exception of special cotton yarns, was reduced per 100 kin as follows :

Not exceeding No. 24 English	from ¥ 5.80 to ¥ 3.75
Not exceeding No. 42 English	from 6.40 to 4.15
Not exceeding No. 60 English	from 9.50 to 6.15
Not exceeding No. 80 English	from 11.00 to 7.15
Others	from 11.30 to 7.35

C. The rate on cement was reduced to ¥0.15 or 50% per 100 kin.

D. Certain kinds of iron pipes and tubes were exempted from import duties.

The above amendments were effective from May 17, 1930.

Amendments During 1931 A. Of import duties on wood, those on Momi (Abies), Tauhi (Picea), Matsu (Pinus) and Karamatsu (Larix) were amended as follows :

(a) Formerly, the import duty on wood not exceeding 200 millimetres in thickness was ¥1.10 per cubic metre, but it was raised to ¥4.45 per cubic metre.

(b) An import duty was newly imposed at the rate of ¥2.70 per cubic metre on other woods (including logs and cants) which were formerly exempt from the duty.

B. Import duty on rayon was reduced from ¥125 to ¥75 per 100 kin.

The above amendments were effective from April 1, 1931.

Amendments During 1932 (1) An increase in import duties was effected as from June 16, 1932 in respect of 29 articles in the case of which circumstances either at home or in the countries of export demanded it. The principal articles, the rates on which were increased, were as follows :

Agricultural products and foodstuffs	Wheat, millet (Andropogon vulgaris), Indian corn, wheat flour, butter, and condensed milk.
Industrial products	Pig iron, wire, reed wires, barbed twisted wires, parts of watches, parts of automobiles, and internal combustion engines.
Forestry products	Certain kinds of wood.

(2) In view of the decline in exchange rates, it was decided to increase, for the time being, the specific duties as provided in the Import Tariff annexed to the Customs Tariff Law to 135 per cent. This increased rate was put into effect on and after June 16, 1932, but is not applicable to the articles mentioned in (1) above.

Amendments During 1933 A. Ephedra herbs, argol, amorphophallus tubers, and bone ashes were newly provided for in the Import Tariff. These articles, except amorphophallus tubers, had been exempt from import duties. In the case of amorphophallus tubers, the import duty was imposed on those in meal at the rate of ¥16 per 100 kin and on others at the rate of ¥5.50 per 100 kin.

B. The following amendments were made in import duties on wood on which no labour was expended after cutting, sawing or splitting :

(a) With respect to logs and cants of douglas fir, etc. under the head of conifers :

1. Those exceeding 18 metres in length and not exceeding 30 centimetres in diametre at the top end were exempted from import duties ;

2. On those exceeding 10 metres in length and not exceeding 30 centimetres in diameter at the top end duty was imposed at the rate of ¥2 per cubic metre ;

3. On others duty was imposed at the

Digitized by Google

rate of ¥2.5 per cubic metre.

(b) With respect to timber of broad-leafed trees, but not provided for in the Import Tariff.

1. On those not exceeding 200 millimetres in thickness duty was imposed at the rate of ¥5.5 per cubic metre.

2. On others, including logs and cants, duty was imposed at the rate of ¥2 per cubic metre.

These amendments were made by Law No. 26 of March, 1933, and put into effect as from March 29. It should, however, be noted that the provisions of Law No. 4 of 1932 are not applicable to the above articles on which specific duties are imposed.

Amendments from January to July, 1935 A. Luxuries and similar articles.

(a) The import duty on precious stones has been reduced from an ad varolem duty of 100 per cent to 10 per cent.

(b) With the abolition of an ad valorem duty of 100 per cent on "shochu" included in the item of alcoholic liquors, such "shochu" has been subject to the General Tariff.

B. Articles in general.

(a) On musk xylol under the heading of artificial musks the duty has been imposed at the rate of ¥125 per 100 kin, and on others an ad valorem duty of 35 per cent has been imposed.

(b) Of bleached plain tissues of flax pure or mixed with cotton, articles which had hitherto been exempt from import duties became subject to the same duties as those on tissues of flax and tissues of flax mixed with cotton.

(c) On magnesium alloys the same duty as that on magnesium has been imposed.

(d) Catalyzers containing vanadium have been exempted from import duties.

(e) On vulcanized fibres the duty has been imposed at the rate of ¥26 per 100 kin.

These amendments were put into effect as from April 4, 1935.

C. In answer to the customs measures taken by Canada against our merchandise, ad valorem duties of 50 per cent are, for one year from July 20, 1935, imposed, in addition to the import duties enumerated in the Import Tariff annexed to the Customs Tariff Law, on the following articles produced in Canada or articles manufactured in bonded manufacturing warehouses from Canadian raw materials:

Wheat, wheat flour, wheat starch, gluten, pulp for paper making (including that for rayon making), packing paper, match paper, endless felts for paper making, and wood under the heading of conifers.

Amendments during 1936 A. Law concerning Adjustment of Trade and Safe-guarding of Commerce (Law No. 45 of 1934).

(a) It was provided that this Law should remain in force until April 30, 1937, but this period has been prolonged till April 30, 1940 by Law No. 1 of 1936.

(b) The Canadian Government, complying with Japan's demands, decided to withdraw the customs measures hitherto taken in regard to Japanese merchandise, and consequently, the Japanese Government abolished, as from January 1, 1936, ad valorem duties of 50 per cent imposed since July 20, 1935 on certain categories of Canadian commodities.

(c) In the course of the negotiations between Japan and Australia, the Australian Government, aiming mainly at Japanese merchandise, has suddenly taken the step of raising customs tariffs or adopting the import licence system. In retaliation for the measures, the Japanese Government was obliged to introduce, as from June 25, 1936, the import licence system for Australian wheat, wool and other commodities by Imperial Ordinance No. 124 of 1936 issued in accordance with Article 1 of the Law concerning Adjustment of Trade and Safeguarding of Commerce, and imposed, in addition to the import duties enumerated in the Import Tariff annexed to the Customs Tariff Law, ad valorem duties of 50 per cent on the following commodities produced in Australia or manufactured from Australian raw materials:

Beef, butter, condensed milk, leather, beef tallow, and casein.

B. The following amendments have been made in the import duties enumerated in the Import Tariff annexed to the Customs Tariff Law:

(a) The duty has been imposed on citronella oil at the rate of ¥41 per 100 kin, and on lemongrass oil at the rate of ¥72 per 100 kin.

(b) On crude oil (including topping) and heavy oil the following duties have been imposed according to the percentage by volume of distillates up to 275° C. by the fractional distillation:

Digitized by Google

1. Not exceeding 20%	¥ 6.05	per kilolitre
2. Not exceeding 25%	7.40	,, ,,
3. Not exceeding 30%	8.80	,, ,,
4. Not exceeding 35%	10.25	,, ,,
5. Not exceeding 40%	11.75	,, ,,
6. Others	13.25	,, ,,

Note : Those containing more than 45% are subject to an additional duty at the rate of 30 sen per 1 kilolitre for every additional 1%.

(c) On mineral oils (including lubricating oils which contain animal and vegetable oils or fats, soap, etc.) other than those mentioned in (b) above, the following duties have been imposed according to specific gravity at 15° C. :

1. Not exceeding 0.8017	¥33.0	per kilolitre
2. Not exceeding 0.8498	28.5	,, ,,
3. Other		
a. Having melting point up to 15°C.	43.0	,, ,,
b. Other	4.6	,, 100 kg.

(d) No duty has been imposed on paraffin wax in crude form, separated from shale oil. On paraffin wax having a melting point up to 45° C. the duty has been imposed at the rate of ¥6 per 100 kin, and on others at the rate of ¥12 per 100 kin.

(e) Acetyl-salicylic acid has been displaced by aspirin on which the duty has been imposed at the rate of ¥112 per 100 kin.

(f) The duty has been imposed on antipyrine at the rate of ¥258 per 100 kin.

(g) Pyramidon has been displaced by dimethylaminoantipyrine on which the duty has been imposed at the rate of ¥437 per 100 kin.

(h) The duty has been imposed on carbonate of guaiacol at the rate of ¥316 per 100 kin.

(i) The duty has been imposed on ionone at the rate of ¥3.5 per kin.

(j) The ad valorem duty of 10% has been imposed on iron bands, cold rolled, containing not less than 0.75% by weight of carbon.

(k) On iron bands other than those mentioned in (j) above, the following duties have been imposed :

1. Cold rolled	25% ad valorem
2. Other	
a. Not exceeding 50 mm. in width	¥1.7 per 100 kin
b. Other	1.5 ,, ,, ,,

(l) On ingots, slabs and grains of aluminium and aluminium alloys, the duty has been imposed at the rate of ¥17.7 per 100 kin ; on bars or rods or plates and sheets at the rate of ¥38.3 per 100 kin ; on wires and tubes 25% ad valorem ; on foils (including inner packings) at the rate of ¥55.8 per 100 kin ; and on waste or old, fit only for remanufacturing, at the rate of ¥17.7 per 100 kin.

These amendments were made by Law No. 38 of 1936, and were effective as from June 1 of the same year.

C. Amendments have been made in the Law relating to Specific Duties in Import Tariff (Law No. 4 of 1932) to include in the list annexed to the Law mineral oils and nine other articles the duties on which were revised by Law No. 38 of 1936 (Law No. 39 of 1936).

D. Amendments have been made in the Law relating to Import Duties on Luxuries and Similar Articles (Law No. 24 of 1924) to eliminate from the list annexed to the Law citronella oil, lemongrass oil and ionone the duties on which were revised by Law No. 38 of 1936 (Law No. 40 of 1936).

E. By Imperial Ordinance No. 237 of 1936 issued in accordance with Article 3 of the Customs Tariff Law, the conventional rates have been applicable to the articles produced in Syria and Lebanon, French mandated territories, except in cases where the rates as provided for in the Import Tariff annexed to the Customs Tariff Law are lower than the conventional rates.

Amendments during 1937 A. Abolition of additional duties on Australian commodities imposed under the Law concerning Adjustment of Trade and Safeguarding of Commerce.

In consequence of the Trade Arrangement concluded between the Japanese

Digitized by Google

and Australian Governments, ad valorem duties of 50% imposed, from June 25, 1936 onward, on certain categories of Australian commodities were abolished as from January 1, 1937.

B. Imperial Ordinance No. 130 of 1937 concerning the Exemption of Import Duty on Iron was put into operation as from April 15, 1937. It should, however, be noted that said Ordinance was abrogated by Law No. 57 of 1937 having nearly the same contents as the aforesaid Ordinance. The provisions of Law No. 57 are summarised as follows:

(a) Iron shall be exempted from the import duty up to June 30, 1939.

(b) In cases where the Government deems it necessary, the period mentioned above may be shortened by specifying articles by means of Imperial Ordinance.

C. The preferential tariffs for Kwantung Province have been amended by Law No. 58 of 1937 as follows:

(a) Hardened oil, made in Kwantung Province of soya bean oil produced in the province, has been exempted from the import duty.

(b) Ammonium nitrate produced in Kwantung Province has been exempted from the import duty.

D. The following amendments have been made by Law No. 55 of 1937 in the Customs Tariff Law and the import tariff annexed to the Law:

(a) Mineral oils for fuel imported by the Government have been exempted from the import duty.

(b) Articles of Government monopoly or materials to be used for the manufacture of alcohol imported by the Government, and aircraft, or motors or propellers for aircraft imported with Government permission in accordance with the provisions of Ordinance have been exempted from the import duty.

(c) Import duties on materials to be used for the manufacture of cellulose pulp may be exempted or refunded in whole or in part in accordance with the provisions of Ordinance.

(d) Mineral oils manufactured from coal or oil shale have been exempted from the import duty. On other mineral oils the following duties have been imposed according to the specific gravity at 15°C.:

1. Crude oil and heavy oil:

(1) Exceeding 0.934	¥ 6.75 per kilolitre
(2) Exceeding 0.904	10.30 „ „
(3) Exceeding 0.860	18.00 „ „
(4) Other	23.40 „ „

Note : Those containing more than 40% by volume of distillates to 215°C. by distillation are subject to an additional duty at the rate of 30 sen per kilolitre for every additional 1%.

2. Other (including those containing animal and vegetable oils or fats, soap, alcohol, etc.) :

(1) Not exceeding 0.8017	¥46.20 per kilolitre
(2) Not exceeding 0.8498	41.00 „ „
(3) Other :	
Having melting point up to 15°C.	71.20 „ „
Other	8.30 „ 100 kg.

(e) Coal gas has been included in the Import Tariff and exempted from the import duty.

(f) "Pulp for paper making" included in Group XI of the Import Tariff has been changed to "Cellulose pulp."

(g) Of the printing paper other than art paper, paper weighing not more than 58 grammes per square metre (excluding that coloured in the paste) has been exempt from the import duty.

(h) Bearing balls given in Group XV of the Import Tariff have been eliminated.

(i) Ad valorem duties on automobiles have been increased to 70%.

(j) On parts of automobiles (excluding motive machinery) the following duties have been imposed.

1. Chassis :	
(1) Not exceeding 250 centimetres in wheel base	¥154.15 per 100 kin
(2) Other	44.42 „ „ „
2. Frames, wheels, front springs and rear springs	14.17 „ „ „
3. Engine hoods, fuel-tanks, running boards (including those with aprons) and bumpers	24.61 „ „ „

Digitized by Google

4.	Front axles (including those with wheel hubs), mufflers, and rims for tyres	¥30.26 per 100 kin
5.	Rear axles (including those with wheel hubs), press worked steel panels for bodies, front doors and rear doors	41.30 „ „ „
6.	Transmissions, steering wheels, steering gears, and instrument panels (excluding those with instruments)	63.99 „ „ „
7.	Universal joints and shock absorbers	86.08 „ „ „
8.	Differential gears and pinions	92.92 „ „ „
9.	Transmission gears	138.30 „ „ „
10.	Other	60% ad valorem duty

(k) On internal combustion engines for automobiles duties have been imposed at the rate of ¥48 per 100 kin, and on those for cycles a 35% ad valorem duty has been imposed.

(l) Of parts of machinery (not otherwise provided for), on card clothing combined with leather the duty has been imposed at the rate of ¥120 per 100 kin, and on others at the rate of ¥60.6 per 100 kin. On bearings ad valorem duty of 30% has been imposed; on bearing balls at the rate of ¥37 per 100 kin, and on others ad valorem duty of 30%.

(m) On cassava-root the duty has been imposed at the rate of ¥1.65 per 100 kin.

(n) Ad valorem duties of 5% have been imposed on denatured molasses.

Of the above amendments, those coming under B, C, and D were effected as from August 11, 1937.

E. Amendment of the Law relating to Specific Duties in Import Tariff (Law No. 4 of 1932).

(a) By Law No. 56 of 1937, the following articles have been provided for in the list annexed to Law No. 4 of 1932, and have been exempted from the application of the specific duties of 135%:

Sugar (excluding sugar under No. 11 Dutch standard), rock candy sugar, cube sugar, loaf sugar, and similar sugar, caustic soda (excluding the refined), cotton yarns (excluding special cotton yarns, otherwise provided for), woollen yarns, mixed yarns of cotton and wool, artificial silk (excluding that made from acetyl-cellulose), cellulose pulp, packing paper and match paper (excluding tissue paper), copper (excluding twisted wires and pipes and tubes coated with base metals), lead (ingots, slabs and tubes), tin (ingots, slabs, and foils), zinc (excluding wires, tubes, plates and sheets nickeled, and other plates and sheets not exceeding 0.17 millimetres in thickness), brass and bronze, parts of automobiles (excluding motive machinery), internal combustion engines for automobiles, and card clothing, reeds of metal and bearing balls of parts of machinery (not otherwise provided for).

(b) The following amendments have been made in the list annexed to Law No. 4 of 1932:

1. Of mineral oils:

Those manufactured from coal or oil shale have been eliminated from the list.

2. Of printing paper other than art paper:

(1) Paper weighing not more than 58 grammes per square metre has been eliminated from the list.

(2) Paper (excluding that coloured in the paste and that weighing not more than 58 grammes per square metre) has newly been provided for in the list.

These amendments were effected as from August 11, 1937, except those for sugar and fourteen other articles which were put into operation as from October 1 of the same year.

Amendments during 1938 A. The following amendments have been made in the Customs Tariff Law and the Import Tariff annexed to the Law by Law No. 63 of 1938:

(a) Hatter's fur has newly been provided for in Article 9, clause 1 of the Customs Tariff Law, and import duties on materials to be used for the manufacture of this article may be exempted or refunded in whole or in part.

(b) The ad valorem duty of 50% has been imposed on cash-registers, calculating machines, and the like, and parts thereof.

(c) Import duties on wood have been amended as follows:

Of Abies (todomatsu, etc.), Picea (ezomatsu, spruce, etc.), Pinus (benimatsu, etc.) and Larix (karamatsu, etc.):

(1) Pinus (benimatsu, etc.) has been exempted from the import duty.

(2) Others:

On those not exceeding 200 millimetres in thickness the duty has been imposed at the rate of ¥6 per cubic

Digitized by Google

metre, and on others, including logs and cants, at the rate of ¥3.64 per cubic metre.

B. The following amendments have been made in Imperial Ordinance No. 238 of 1921 by Imperial Ordinance No. 201 of 1938:

(a) As Abies (benimatsu, etc.) has been exempted from the import duty in the Import Tariff annexed to the Customs Tariff Law, it has been eliminated from the articles mentioned in Imperial Ordinance No. 238 of 1921.

(b) Rabbit and hare furs, materials for hatter's furs, have been exempted from the ad valorem duty of 40%.

The above amendments were effected as from April 1, 1938.

CHAPTER XII

INSURANCE

General Survey

Marine Insurance Comes First In Japan, as in most maritime countries, marine insurance preceded life insurance, but the margin of time separating the two was much narrower in Japan, for there was a difference of two years only. Following the Restoration in 1868, the feudal lords or daimyo were dispossessed of their domains, but the Meiji Government undertook to compensate them for the lands confiscated. The condition of Government finance, however, did not permit of the payment of large sums of cash to the daimyo and pension bonds were issued to them instead. Hachisuka, Ikeda, Daté and other powerful and rich lords searched for an outlet for their energies and surplus funds and, deciding on insurance, advanced a plan to form a marine and fire insurance business after the British system. A company was incorporated in Tokyo in January 1879, with Eiichi Shibusawa as the person most intimately concerned with the consummation of the plan, and Yataro Iwasaki, the founder of the Mitsubishi interest, as his able lieutenant. The initial capital was ¥650,000. Marquis Hachisuka was president and Shibusawa and Iwasaki advisers.

Life Insurance Follows The late Taizo Abé was the originator of life insurance in Japan. Two years after the introduction of marine insurance he founded the Meiji Life Insurance Company in September, 1881, with a capital of ¥150,000. The promoters of this company were mostly graduates of the Keio Gijuku (present Keio University). In 1888 the Teikoku Life insurance Company was founded, and the Nippon Life Insurance Company was incorporated in Osaka in the following year. Zenjiro Yasuda was the founder of the Meiji Fire Insurance Company, the first of the kind in Japan.

The Present Status The home insurance business at present consists of 13 kinds, namely, life, life annuities, military conscription, accident, marine, fire including forest fire, transportation, automobile, burglary, glass, fidelity, engine and boiler and air insurance. Conscription insurance is interesting as it cannot be considered as pure insurance. The idea is to provide relief to the parents of young men who are called up to serve their time in the army. The insurance is taken out at any time from birth to 15 years of age, then, when the boy is conscripted at 20 years of age, the sum contracted for is paid to his parents. In case the boy is not called upon to serve his time in the army the premium only is repaid, and the assured persons who are enrolled in the army and participate in the forfeited and accrued interest of those not called up together with that of those who have died before being conscripted. It is 40 years since the business was first commenced and four companies engage in it.

Post Office Life Insurance

With a view to promoting the welfare of the middle and lower classes of the community, the Post Office Life Insurance Law (Law No. 42) and the Post Office Life Insurance Special Account Law (Law No. 43) were promulgated on July 8, 1916, the former being put into effect on October 1 and the latter on August 20 of the same year. The main features of the life insurance schemes may be summarized as follows :

1. This insurance is the work of the Government and is to be dealt with at the post offices.

2. The amount of insurance for a person will be from ¥20 up to ¥700.

3. The insured need not be subjected to any physical examination.

4. If the insured die within one and a half years from the conclusion of the insurance contract by some causes other than the calamities or the infectious diseases specified in law, a portion of the amount insured will not be paid.

5. This insurance is divided into Whole Life, Endowment and Infantile. Endowment policies are divided into seven kinds of the terms of 10 years, 15 years, 20 years, 25 years, 30 years, 35 years and 40 years. Infantile policies are, at present, either 15 years or 20 years endowment.

6. The age of a person to be newly insured must be between 1 and 60 years.

7. The Mortality Table constituting a basis for the computation of premium was compiled by adding 20% to the Male Mortality-Rates of the Japanese Population Table No. 2 published in 1912 by the Government Statistics Bureau. The rate of interest assumed is 3½% per annum.

8. The premiums are to be paid monthly. Reduced premiums are prescribed for the cases in which monthly premiums are paid in a lump sum in advance.

9. The period within which premiums should be paid is fixed at one month. Two months' grace is allowed.

10. Within one year after the lapse of the policy, it may be revived.

11. When, after the conclusion of the contract, the insured either loses one or both of his limbs or becomes blind of both eyes, future premiums need not be paid.

Whenever a policy has been in force for a period of thirty years and the insured person has reached the age of 70, the policy holder concerned may propose to have his future premiums paid up.

12. When, after the lapse of five years from the conclusion of the contract, the payment of the insured sum or the repayment of the paid-in premium is made, the beneficiary shall receive an additional sum as a dividend.

13. A loan may, on the application of the policy-holder, be granted within the limits of the amount which is to be paid back on the cancellation of the insurance contract, provided, however, that such loan shall not exceed 50/100 of the amount of insurance.

14. In order to maintain and promote the health of the insured, 230 Health Consultation Stations have been established so far in pursuance of the Health Consultation Service Regulation, 1922, in the principal cities.

15. Beneficiaries or policy-holders are required to ask the judgment of the Post Office Life Insurance Committee of Inquiry prior to legal action against the Government for their contracts.

Post Office Life Annuities While the history of the Post Office Life Annuities may be traced to as far back as 1897, the authorities concerned thought it wise to introduce Post Office Life Insurance first and see how this would work. In 1926, changed social conditions and with the maturing of the first Post Office Life Insurance Endowment Policies gave favourable indications that the Annuity business would be successful, and a bill was introduced into and approved by the Diet in March.

The main features of the system which came into operation on October 1 of the same year may be summarized as follows :—

1. The annuity business is to be administered on the same system as that of the Post Office Life Insurance.

Digitized by Google

2. Annuities that may be purchased are divided into :

(1) Immediate Life Annuities.

(2) Deferred Life Annuities.

(a) Annuities commencing at the age of 50.
(b) Annuities commencing at the age of 55.
(c) Annuities commencing at the age of 60.
(d) Annuities commencing at the age of 65.

3. Post Office Life Annuities may be purchased either with or without provision for the return of the purchase money, and purchasers must select one of these two plans when they make their application.

4. The ages of persons entitled to become annuitants under this system must fall, in the case of Immediate Life Annuities between 40 and 80 inclusive and in the case of Deferred Life Annuities between 12 and 60 both inclusive.

5. The premium rates are calculated on the mortality rates by deducting 20 per cent for males and 30 per cent for females from the general mortality rate of the Japanese population.

The rate of interest allowed in the calculation of the value of annuities under the instalment payment plan is 3.5 per cent. And under the single payment plan, the rate shall be determined, from time to time, by the Minister of Communications upon the basis of the current market price of public bonds. The rate is fixed at 3.7 per cent for the present.

The reserves to be maintained against policies are worked out by the net premium method.

6. The maximum annuity that can be purchased on the life of any one person is ¥2,400, and the minimum is ¥120 under the instalment premium plan or ¥12 under the single premium plan.

7. Premiums are payable either in a single sum or by instalments; in the latter case, the premium payment is divided into four periods, namely, 10 year payment, 15 year payment, 20 year payment and ordinary payment, and the premium may also be paid yearly, half yearly or quarterly. All premiums are payable at any post office designated by the purchaser or at his residence to the collector.

8. In the case of an Immediate Annuity, the payment of annuity will begin on the date of application and continue until the death of the annuitant. In the case of a Deferred Annuity, the payment of annuity will begin on the date the annuitant reaches a specified age and continue until the death of the annuitant.

9. Annuitants are given the right, subject to certain conditions, to claim change in their contracts.

10. Should events stipulated as reasons for the return of purchase money actually occur, such return is to be made according to prescribed conditions.

11. Provided a contract reserves the right for the purchaser or the annuitant to claim refund of premiums paid, such person may avail himself of a cash loan of not more than 50% of the premiums paid, provided that the sum is not less than ¥20 per cotract or, if the proceeds are to be applied to the payment of the premium, a sum equal to one year's premiums.

12. Annuitants or purchasers are requested, before bringing a civil action against the Government in respect of their contracts, to submit their cases to the Post Office Life Insurance Committee of Inquiry.

13. A special account is established for this business.

Improvements in 1939 I. Guaranteed Period System

(A) A Guaranteed Life Annuities plan is newly added to the kinds of the old system. According to the contract of the new Guaranteed Life Annuities, the annuity shall be paid to the annuitant, as usual, as long as he lives and when he dies after the annuity began within the period specifically fixed as the guaranteed period of annuity the same amount of annuity shall be paid, during the lest of the guaranteed period, to the bereaved who is given with the right of receiving the annuity continuously, or in case the annuitant dies before the annuity begins or at the cancellation of contract the purchase money shall be returned to the policyholder with the additional sum of compound interest at the rate of 2 per cent per annum. The new policy will protect the right of the policy-holder much further than in the cases of the old policies. The widows or the disabled men above 20 years of age may specially be benefited by the new plan.

(B) Kinds of the New Policy

There are two kinds of the Guaranteed Life Annuities; one is Guranteed Immediate Life Annuities the guaranteed period of which begins on the date on which the contract becomes effective and continues either for the following 15 years or 20 years or 30 years; the other is Guaranteed Deferred Life Annuities, the guaranteed period

Digitized by Google

begins on the date of the commencement of annuity and continues for the following 20 years, provided that the year of age in which annuity begins is fixed either at 50 or 55 or 65.

(C) Eligible Years of Age

The years of age eligible for contracting Guaranteed Immediate Life Annuities are from 40 to 75 both inclusive in the case of the guaranteed period the duration of which extends over 15 years or 20 years, and widows or a certain disabled men of the age from 20 to 40 only are eligible to such annuities in the case of the guaranteed period the duration of which extends over 30 years.

The years of age eligible for contracting Guaranteed Deferred Life Annuities are from 12 to 60 both inclusive.

(D) Amount to be Returned

The return of the purchase money may be claimed only before the date of the commencement of annuity. The return shall be made as follows:

a. At the death of the annuitant the total amount of the purchase money may be returned with the additional sum of compound interest at the rate of 2 per cent per annum.

b. In the case of the surrender of or change in contract the same amount or 90 per cent of the amount mentioned in (a) above may be returned.

II. Special Returns of the Purchase Money to the Bereaved Family of the Annuitant Soldiers or Men Who were Killed or Died at Battles

According to the provisions of the old Post Office Life Annuities Law annuities were paid regardless of the causes of death, i.e., whether or not the annuitants die either because of wounds or diceases at the time of services in war or emergency or on other occasions. The new revised law gives a special privilege of receiving the return of the purchase money to the bereaved families of the annuitants who died in battles or in other services for national defence on or after July 7, 1937, as follows:

a. In the Case of the Contract with Provision for the Return of the Purchase Money; 90 per cent of the remaining sum of money, after the deduction of the amount receivable at the death of the annuitant according to the provision for the return of the purchase money, may specially be refunded.

b. In the Case of the Contract without Provision for the Return of the Purchase Money; 80 per cent of the amount of the purchase money may specially be returned. But, in the cases of the Guaranteed Immediate Life Annuity and the Guaranteed Deferred Life Annuity the annuity for which has already begun, 90 per cent of the remaining sum of the purchase money, after the deduction of the unpaid annuities due to the guaranteed period culculated according to the current value, may specially be returned.

III. Payment of Premiums at the Annuitant's Option

Premiums are payable, as mentioned above, either in a single sum or by instalments. But, in the latter case, the years of payment extend for so long a period that a person may hesitate to enter the contract because of the uncertainty of his capacity of instalments in the coming years, whereas he is able to pay at once the amount corresponding to the instalments for some years, yet, at the same time, the money in hand is short for the single sum payment. To go between the two old ways of paying premiums, therefore, the new revised Law prescribes for a free-time payment of premiums "payable not at call but at any time when he has money," so that the annuitant may be able to pay any sum of money at convenient time on his policy and may at the same time increase the amount of annuity at his option.

Minor Points of Improvement

(A) On the Restrictions of the Receiver of the Return of the Purchase Money

The right for the purchaser or the annuitant to claim refund of premiums paid was extended to a person designated as "the receiver of the refund" other than the contractor or the annuitant to whom the right was exclusively reserved according to the old law.

(B) Abrogation of one of the Contracts without Provision for the Return of the Purchase Money

The contract of the Deferred Life Annuities without Provision for the Return of the Purchase Money has been rarely made, and the new contract of this kind was thought advisable not to be allowed any more.

(C) Refund of Premiums Paid on the Occasion of the Cancellation of Contract by Statute

The cancellation of contract by statute was effected according to a similler principle with that of the Post Office Life Insurance. But the revised Law prescribes for refunding the total amount of premiums paid even on such

Digitized by Google

occasion, provided that there was no important falt or ill-will on the part of the contractor.

(D) Surrender of the Right of Cancelling a Contract

The number of the contractors who surrender the right of cancelling a contract for the purpose of protecting the annuitant is considerable. The heart of such action is by no means condemnable in view of the main principle of the life annuity system. And the revised Law recognises such action by a clear statement on the subject.

(E) Refund of Loan from Annuity and the Return of the Purchase Money

Provided a contract reserves the right for the contractor to claim refund of premiums paid, such person may avail himself of a cash loan of not more than a fixed percentage of the premiums paid. But when the refund of the loan is delayed for many years the result may be detrimental to the benefit of both the annuitant and the Government. The revised Law, therefore, prescribes for refunding the loan by a deduction from the annuity to be paid and the return of the purchase money on the expiration of a fixed period of grace.

(F) Besides, further improvements are contemplated which are to be effected by the revisions in the associated Imperial Ordinance and Departmental Orders, especially by introducing a collective life annuity system on small instalments of premiums to provide for an easier contract for the operatives in factories and mines and lower clerks in commercial companies or shops.

State Live-Stock Insurance

The live stock insurance business is making steady progress. In March, 1930 there were only 6 societies engaged in the live stock insurance business, and only 1,304 head were insured for an aggregate amount of ¥127,622. The amount had increased to ¥19,491,871 in March, 1934 and to ¥39,790,494 in March, 1937. The following shows the business results of the last 5 years :

LIVE-STOCK INSURANCE

State Health Insurance

On March 31, 1936, the number of labourers holding policies in the State Health Insurance was 3,043,934, an increase of 717,240 as compared with the previous year. Of the total, 3,026,650, were compulsorily insured; the number of contracts under Government control was 2,096,657 as against 947,277 of contracts under the control of 370 health insurance associations.

In 1936-37, the amount paid out to the beneficiaries reached ¥45,882,742 for 10,848,429 cases. For full particulars figures follow:

HEALTH INSURANCE

Health Insurance for the Salaried Classes

A health insurance system for salaried employees has at last been enacted into law. The bill approved at the recent session of the Diet proposes to answer the urgent need for the maintenance and promotion of the health of the nation. The present insurance scheme aims to do for salaried employees exactly what the National Health Insurance and other forms of social insurance undertake to do for the protection of persons living in rural districts and fishery villages, workers in factories and mines, and small and medium-sized tradespeople.

The present health insurance is made compulsory for the purpose of rendering the insurance facilities accessible to as many persons as possible and also in order to reduce as far as feasible the contribution by each insured person. For one thing, if the insurance is left voluntary, there is strong likelihood that weak and ailing persons only will be induced to become the insured which, of course, is not a desirable thing for the system. The operation of the present health insurance system will be limited to the cities and such towns and villages as are specially designated by the competent Minister of State.

In the second place, the scheme will be applicable to the offices or places of business having not less than ten persons constantly in their employ. A business office or a group of stores having not less than 300 employees may, with the approval of a majority of the insured persons, organize an Association for Health Insurance for the Salaried Classes. Although it is often in small offices and stores that health protection is more urgently needed, they must of necessity be excluded for the present from the application of this insurance system.

Thirdly, the scope of business offices or stores to which the system is applicable is for practical purposes limited to the following:

(a) trading and commerce, (b) finance and insurance, (c) custody and leasing of property, (d) commission agencies, (e) collection of money, information, and advertising, and (f) other business to be designated by Imperial Ordinances. It may be added in this connection that persons with incomes of not less than ¥1,200 a year may not receive the insurance protection.

The present health insurance system provides for various benefits for the insured person in cases of illness, accidents, burial, childbirth and maternity. It is the purpose of the scheme gradually to extend its benefits and protection to members of the families of the insured persons. Below is a brief account of the insurance benefits provided for by the system.

(A) Medical Expense In case an insured person receives medical care for illness or accidents, 80 per cent of the expenses is paid by the System. This aid extends beyond the ordinary medical care to hospital, operation and nursing expenses and is granted for a period of six months in the same case. In special instances designated by the competent Minister of State where prolonged medical care is needed, the period of the aid may be extended for not more than one year. Where, again, an employee is under medical treatment when the person loses qualification to be insured by reason of retirement or otherwise, the aid may be continued as prescribed, provided that the same person shall have previously been in the employ for a stated period.

(B) Allowance in case of Illness or Accident Where an insured person is compelled, on account of illness or accident, to rest from work for any length of time, the person will receive an allowance in addition to the aid mentioned above. The allowance will in ordinary cases amount to 50 per cent of the regular pay, and will be given

Digitized by Google

after three months of absence in the case of those who receive monthly pay and after a period of ten days in the case of those who receive daily pay; for in both cases the regular pay is continued during the respective periods.

(C) Burial Allowance In case of the death of an insured person and where the burial is effected by the bereaved family whom the deceased had been supporting, a grant of money corresponding to one month's pay but not less than thirty yen will be made in aid of burial expenses. Where there is none left entitled to receive this award, the person effecting the burial will be compensated up to the extent given above. When a person dies within three months after the loss of the qualifications for the insurance protection or when any person dies who had been receiving the insurance protection after having been disqualified for the insurance or when such person dies within three months after ceasing to receive the benefits, the same burial allowance or expense will be paid likewise.

(D) Childbirth When an insured person is delivered of a child, a sum of twenty yen will be awarded towards the necessary expenses. In such cases, it may be feasible to send the person to a maternity hospital or otherwise give the needful assistance. In this instance the awrad mentioned above will be ten yen instead of twenty yen. The benefits in connection with childbirth will be available where the person had been insured at least for a stated period during one year previous to the event. Where, again, the childbirth occurs within six months after the person had been disqualified, she may receive the benefits as well as the maternity allowance mentioned below.

(E) Maternity Allowance In addition to the foregoing award at childbirth, the insurer will grant for a stated period immediately before and after the childbirth an allowance corresponding to 50 per cent of a day's earnings. The recipient of the allowance may not receive any illness or accident allowance simultaneously.

The foregoing description roughly covers the work of the health insurance system for the salaried classes. Not content with the protection of the sick and weak, the scheme plans to take more fundamental measures calculated to promote the health of the salaried classes.

Lastly, as regards the premiums, the contributions are, as in the case of other social insurances, made half and half between the employers and the employees; the rate is fixed generally at about 2.5 per cent of the monthly income. At this rate, where a person has an income of sixty yen a month the premium will be ¥1.50, for which ¥0.75 each will be contributed by the employer and the employee. Under this arrangement, the cost of the system to the Treasury will practically correspond to the administrative expenses of the institution.

CHAPTER XIII

AGRICULTURE

Farm Households and Arable Land

Farm Households Number of farm households totalled 5,574,879 at the end of 1937, which is 42% of the total number of households in Japan proper. Comparison with that of the previous year indicates a decrease of 22,584 or 0.4 per cent.

As classified into those engaged wholly or in part in agriculture, the figure consists of 4,180,672 of the former, and 1,394,207 of the latter.

Farm households cultivating their own lands numbered 1,733,997; the number of tenant-farmers and households cultivating their own lands together with those leased being 1,500,994 and 2,339,888 respectively.

Classified by size of area cultivated, farm-households cultivating less than 0.50 cho number 1,884,575, a decrease of 11,282 from the previous year, those between 0.50 and 0.99 cho, 1,914,018, a decrease of 8,592, between 0.99 and 1.99 cho 1,262,814, an increase of 708 over the previous year, and those over 1.99 cho, 522,065, a decrease of 2,919.

Owners of Arable-lands The number of owners of arable-lands totalled 5,141,968 at the end of 1937 decreasing from that of the previous year by 8,252. When classified according to area owned, those who own less than 0.50 cho number 2,550,259, and those owing from 0.50 cho to under 0.99 cho number 1,304,924. In this way the greater the areas, the less number of owners, and so those owing 50 cho and over are only 3,252 (or 0.1 per cent) in number. In the light of the tendency during the previous ten years general increase was traceable in the total number, but it turned to decrease in 1937, while by reference to the tendency of number fluctuation according to area owned, those under 3 cho are pursuing a steady upward course, those owning more than 3 cho showing the reverse trend.

Area of Arable-lands Area of arable-lands at the end of 1937 was computed at 6,098,435 cho, occupying 15% of the total area of Japan proper. This figure consists of 3,217,928 cho (53%) of rice-fields and 2,860,506 cho (47%) of upland-farms. Comparison of these figures with those of the previous year indicates a slight increase on the part of the former and increase of 12,305.4 cho (0.4%) in the latter.

Classified into those cultivated by owners of lands and those by tenant-farmers, area cultivated by the former was 3,266,045 cho (54%), increasing by 12,325.9 cho (0.4%), the latter being 2,832,389 cho (46%), increase by 222.6 cho (0.01), both as against the figures of the previous year.

FARM HOUSEHOLDS AND ARABLE LANDS IN JAPAN PROPER

(Compiled by the Ministry of Agriculture and Forestry)

FARM HOUSEHOLDS

Year (At the Year End)	1933	1934	1935	1936	1937

Cultivated by tenant-farmers	1,126,289	1,126,151	1,136,075	1,141,242	1,181,694

Rise in Land Value

The value of arable lands generally went up in 1938, the average percentage of rise being 10 per cent, unprecedented since the years of the World War. The reasons for the rise are the rise in prices of agricultural products, the reduction of taxes on farm lands because of the revisions in the rates of rent, the decrease of tenant disputes on account of the emergency, and the increase of incomes of farmers.

PRICES OF FARM LANDS IN 1938

(In yen per tan)

	Average Price in Japan Proper	Rise over the Previous Year	Percentage of Rise
Rice field			
First class	656	54	9.0
Second class	519	49	10.4
Third class	365	37	11.3
Up-land farm			
First class	420	31	8.0
Second class	304	26	9.4
Third class	192	21	12.3

Value of Production

The total value of production by 5,574,879 farm-households in 1936 amounted to ¥4,328,173,551 (¥776 per household) including farm products, minor industries, live stock, cocoons, raw silk and forestry production. (For details of the last three items see following chapters.)

PRODUCTION BY FARMERS IN 1937

(In yen)

Rice in 1938

Price of Rice The standard price for 1938, or for rice cropped in 1937, was fixed at ¥27.30 minimum and ¥35.40 maximum per koku of unhulled rice. The actual maximum quotation went up as high as ¥36.77 in December in the Tokyo exchange and the average for the year was ¥35.79, a rise of ¥2.60 as compared with the previous year. The standard price for 1939, or for rice cropped in 1938 is fixed at ¥29.90 minimum and ¥35.40 maximum, i.e. the minimum price is raised by ¥2.60 while the maximum price is left same with that of the previous year. The main reason for keeping the maximum price in the same standard with the previous year is to control the price of rice in accordance with the general national policy of price control for the wartime economy of the nation, because, in Japan, the price of rice is an important barometer of prices of other commodities.

The standard prices for the years since the enactment of the Rice Control Law in 1933 have been as follows:

STANDARD PRICES OF RICE

(In yen, per koku)

For the Year	Standard Price: Minimum	Standard Price: Maximum	Standard Price: Stretch	Price adjusted by the general prices of other Commodities
1934	22.70	30.50	7.80	25.26
1934	23.30	30.50	7.20	24.41
1935	24.30	31.50	7.20	24.88
1936	24.80	33.20	8.40	27.23
1937	24.90	33.90	9.00	29.09
1938	27.30	35.40	8.10	33.67
1939	29.90	35.40	5.50	38.26

Cost of Production of Rice According to the report of the Imperial Farm Association the cost of production of rice in 1938 was ¥28.45 per koku in the case of landed farmers, a rise of ¥2.58 (10 per cent) as compared with the previous year, and ¥30.77 in the case of tenants or a rise of ¥2.06 (7.2 per cent), making an average of ¥29.54 or a rise of ¥2.37 (8.7 per cent).

The wartime economy of the country increased expenses in almost all items of cost as shown in the fillowing table:

Rice Crop in 1938 According to the report of the Ministry of Agriculture and Forestry the rice crop in 1938 amounted to 65,869,092 koku, decreasing 450,672 koku or 0.7 per cent from the previous year, but showing an increase of 3,111,944 koku or 5.0 per cent over the average crop for the preceding 5 years. The area devoted to rice was 3,220,729 chobu and the average crop per tan (0.1 chobu or 0.245 acre) was 2.045 koku or 10.468 American bushels.

The growth of the rice plant was hindered by rainy weather conditions in the months right after its plantation in a part of the country, but later the weather was mostly favourable for the growth throughout the country, especially at the time of blooming, so that the last outcome showed a 2.7 per cent increase over the second forecast.

The comparison of the last 6 years is as follows:

RICE CROP IN 1933-1938
in Japan Proper

	Area Planted (In Chobu)	Rice Crop (In Koku)
1933	3,173,203.3	70,829,117
1934	3,172,610.6	51,840,182

Other Farm Productions

Leguminous Plants Area of leguminous plants in 1937 was 606,184 cho and the production was valued at ¥96,048,470. During the past decade the area planted has been pursuing a slow downward movement, while a sharp reduction experienced by production was more than made good by the increase

Digitized by Google

of 1933. Soy-beans and azuki (red) beans are predominant both in area and production. The area of plantation and the amount of production of these two articles in 1937 were as follows:

	(In cho)	(In koku)	(In yen)
Soy-beans	331,572	2,842,543	50,848,576
Azuki beans	104,288	833,333	17,272,620

Tuber and Root Crops Area cultivated with tuber and root crops in 1937 was 664,268 cho and the value realized from their production was ¥243,066,285 and both showed an increase as compared with preceding years. From the standpoint of area and production, sweet potatoes, 'daikon' (giant radish), satoimo and potatoes are predominent.

	(In cho)	(In kan)	(In yen)
Sweet potatoes	288,776	1,030,115,309	91,214,087
Daikon	107,077	654,792,501	46,460,168
Potatoes	171,125	551,170,209	48,595,431

Industrial Crops Area cultivated with industrial crops in 1937 amounted to 294,079 cho and the production was valued at ¥140,291,145.

Chief products are summarized below:

Tobacco	17,049,810 kan	¥46,832,123
Sugar cane	1,693,358,599 kin	11,989,058
Rapeseed	1,102,630 koku	24,960,741
Rushes	17,288,674 kan	9,295,377
Insecticide flowers	2,549,592 kan	8,214,032
Arum	15,296,744 kan	9,563,757

Vegetables Area under vegetables in 1937 was 221,908 cho and the value of the production was estimated at ¥128,122,197.

Chief products are given below:

Water-melons	121,729,228 kan	¥20,878,955
Tsukena	192,156,031 ,,	20,616,731
Egg-plants	123,655,273 ,,	17,687,163
Cucumbers	78,863,260 ,,	12,674,690
Negi (onion)	67,255,839 ,,	12,363,085
Pumpkins	89,229,812 ,,	11,114,608
Tomatoes	43,663,258 ,,	7,397,441

Fruits The production of fruits in 1937 was valued at ¥92,114,502, having increased by ¥10,302,051 as against the figure of the previous year.

Predominant are the following:

	kan	¥
Mandarin oranges	117,018,552	25,357,178
Persimmons	61,528,088	13,092,734
Japanese Pears	42,743,403	11,776,705
Apples	41,572,442	14,884,442
Grapes	18,411,989	6,479,552

Tea Tea grown in 1937 was 14,376,762 kan in quantity and ¥34,356,516 in value. Review of the past decade indicates an unbroken rise in production as a whole, while fluctuations in values of production have been brought about by falling-off of prices.

Livestock and Poultry (1) Horses. Horses at the end of 1936 numbered 1,431,920, consisting of 816,599 female and 615,321 male. Foals and horses died to the number of 127,316 and 27,218 respectively. The increase in number during the past decade has been very slow, often tending towards decline.

(2) Cattle. Cattle at the end of 1936 numbered 1,770,938 (female, 1,327,872 male, 443,066). Calves and cattle died numbered 313,994 and 17,635 respectively. The tendency of the past ten years was a steadily increasing one.

(3) Swine. Number of swine at the end of 1936 totalled 1,110,000. During the year, swine died or killed numbered 113,000. The rising of swine has been showing a sharp advance during the past decade, the number at the beginning of the decade being nearly doubled by the close of the same period.

(4) Sheep and Goats. Sheep and goats at the end of 1937 numbered 89,815 and 293,302 respectively, both increasing as compared with the previous year, and the tendency during the past ten years has been towards increase.

Generally speaking, the raising of sheep and goats is still on quite a small scale in spite of this marked progress.

(5) Fowls. The total number of fowls at the end of June, 1937 was 51,266,000 (valued at ¥38,905,000). During the past ten years the number has increased by nearly 100 per cent.

Livestock Products (1) Milk. The quantity of milk obtained in 1937 amounted to 262,314,993 litres valued at ¥37,167,007. The number of cows milked was 107,878 at the year end.

(2) Meat and Animals Slaughtered. The number of slaughter-houses at the end of 1937 was 714 and number of animals slaughtered and the quantity of meant obtained were as follows:

Number of Animals Slaughtered	
Horses	71,427
Cattle	345,585
Calves	43,661
Swine	1,222,249
Sheep	2,534
Goats	4,207
Total	1,689,463

Digitized by Google

Quantity of Meat Obtained

	kilogramme
Horses	10,497,131
Cattle	64,523,122
Calves	2,647,629
Swine	60,042,749
Sheep	46,927
Goats	43,654
Total	137,801,212

(3) Dairy and Meat Products. Dairy production in 1937 amounted to 58,687,560 kin valued at ¥29,077,079. Meat proructs totalled 7,818,065 kin valued at ¥4,813,533.

(4) Eggs. Number of eggs obtained during the year ending June, 1937 was as follows:

	July, 1936—June, 1937	
	Number	Value
Fowls'	3,642,988,779	¥100,129,706
Ducks'	14,757,849	441,573

During the past decade the production of eggs has shown a substantial increase especially as regards fowls' eggs of which production in 1931 more than doubled the figure of 1922.

Village Societies

The co-operative societies of this country have developed from the older credit societies. The business of granting credits still forms the most important of the activities of the co-operative societies. There are at present about 15,000 of these societies throughout the country, which have a total membership of over 6,000,000. Of these institutions 13,400 are loan associations which are mostly located in agricultural villages, accomodating their members with industrial and economic funds and accepting deposits from their members and public organizations.

Of the 13,400 loan associations more than 1,300 are engaged only in supplying loans to members; but their number is gradually decreasing because the Government is, in line with a five-year co-operative expansion programme, encouraging them to function as trading, purchasing and utilization associations as well.

Those which discount bills and accept deposits from non-members are called credit associations in the cities and are placed under the supervision of the Finance Ministry, while those in villages are controlled by the Ministry of Agriculture and Forestry.

The latest statistics show that deposits with these credit associations throughout the whole country total approximately ¥1,500,000,000, and their loans amount in all to about ¥1,000,000,000. They are playing an important part as mutual credit associations for the masses, both in agricultural villages and towns.

As to the credit associations in cities, their number is 274, with a total of 310,000 members, having ¥277,000,000 in deposits and ¥190,000,000 in advances. Some of them have from ¥5,000,000 to ¥8,000,000 each in deposits but the average amount for one institution is ¥790,000 against some ¥630,000 in advances.

There are two central institutions designed to facilitate the activity of these associations. One is called the Shinyo Kumiai Rengokai or Federation of Credit Associations, which represents the credit associations of each Prefecture, and the other is the Sangyo Kumiai Chuo Kinko, or the Central Chest for Co-operative Associations, which was established for regulating the movement of funds of the Federation above mentioned and the industrial associations all over Japan. (See Chapter IX)

Village Cereal Warehouses At the time of the great crop failure which resulted from the unseasonably cold weather in the Tohoku or North-Eastern District in 1934, the Imperial House granted a large sum of money, in November of that same year, for instituting some permanent system of mutual relief and rehabilitation for the farmers in the district.

Accordingly the Government, in order to comply with the Imperial wishes, decided upon establishing and popularizing 'Go-Kura' or village warehouses

Digitized by Google

for storing cereals against emergencies in those parts. It distributed an aggregate sum of Yen 1,636,800 for the 1934 and 1935 financial years to the prefectures in the district, where 1209 old cereal warehouses were enlarged and renovated and as many as 4,921 new ones established, making a total of 6,130 at the end of March, 1936.

A warehouse association has been formed in each village and each farmer-member of the association is required to store his crop of any particular year by the end of December. The aim is to complete full stocks of cereals in about five years. There are many villages where special community farms for the purpose are cultivated either by members themselves or by tenants.

NUMBER OF VILLAGE WAREHOUSES

	Total	Owners		Capacity	
		Public bodies	Federation	For cereals	For cocoons
1933	6,416	6,348	68	20,716,000 (bales)	3,841,000 (kan)

Education of Farmers

At the end of 1937 the number of farmers educated on subjects relative to farming was 5,761,217, an increase of 178,879 or 3 per cent over the previous year. The results of investigation on their school education were as follows:

	Number	Percentage
Total number of farmers investigated	5,761,217	100.00
Educated in schools	4,374,391	75.93
Elementary	4,003,721	69.49
Middle	355,282	6.17
Higher	11,462	0.20
University	3,926	0.07
Educated in Agricultural Lecture Halls	1,386,826	24.07

Agriculture in 1938 and 1939

Law for Agrarian Adjustment Conditions of farming villages naturally differ according to localities, especially in regard to farm earnings, making it difficult to provide generalized and summarized rules governing detailed conditions in different farm villages. The provisions of the Law are confined to matters fundamental and common to different localities, leaving matters of detail to the commissions on farm land which are to be created in cities, towns, villages and prefectures and to a system of arbitration. These commissions and the arbitration system are to function, with mutual concessions and cooperation among the persons concerned, to adopt and carry out concrete and appropriate measures in strict consonance with actual conditions of the respective localities, for the adjustment of affairs related to farm land.

The principal points in the Law for Agrarian Adjustment, enacted in 1938, may be listed as follows:

First, the Law provides for a system under which cities, towns, villages or other appropriate public organizations may, on request, manage, protect or utilize farm land in behalf of farmers who, because of military service or other reasons, are unable to till or manage their own land or leased land. Or, these organizations may buy up such land and dispose of it in line with the purpose of creating independent farmers and other principles governing the plans for the adjustment of farm land.

Secondly, the Law provides that, when prefectures, cities, towns, villages or other appropriate organizations attempt to acquire or use land necessary for the purposes of creating independent farmers, or of possessing it for lending, with a view to attaining economic recovery of farming villages, they may negotiate, on approval by the competent administrative authorities, with owners of such land or those who possess the real rights over it, regarding transfer of the land or setting up of rights over earnings from the land. In case such negotiations fail to bring about an agreement, they may ask for legal arbitration. Furthermore, in case the above-mentioned organizations attempt to exploit undeveloped land, such land may be acquired for them by applying the Law of Expropriation of Land, after negotiations with the owners have failed.

Again, in view of the necessity of preventing tenant disputes and other

Digitized by Google

undesirable developments arising out of the consolidation or disposal of land for the economic recovery of farm villages, the proposed Law provides that the competent administrative authorities, in case of necessity, may cause cities, towns, villages or other organizations to announce their plans in advance to the Commissions on Farm Land of their respective localities, so that the latter may have an opportunity of creating independent farmers or of making other feasible arrangements.

Thirdly, with respect to independent farm land created or maintained by Government subsidy or other aid, it is so provided that sales or transfer of the land and setting up of the real rights on it by the owner shall be legally invalid, unless approval has been given by the authorities, and the owner shall be required to register the land strictly in line with this particular provision. This arrangement serves to enable the land owner to protect himself against a third party regarding the land.

Fourthly, the Law provides the following means of insuring and stabilizing the livelihood of tenant farmers:

(1) Contract for lease of farm land entered into between two parties shall be valid against a third party even if such a contract is not registered. Hence, the contract of the lease shall not be affected by transfer of the ownership of the land due to sale or other reasons, or by mortgage rights or real rights that may be set up.

(2) The land owner may not cancel a contract of lease of that land without consent of the lessee or refuse to renew the contract at its expiry, except in cases when the lessee without good reason defaults in payment of the rent or commits perfidious acts, or when the land owner becomes obliged to cultivate the land himself or to use the land for building dwelling houses or for other justifiable purposes, or when the land owner, for good reasons, becomes unable to continue to keep the land under tenancy.

(3) When a contracting party intends to cancel the lease of the farm land or to refuse the renewal of it, he shall be required to notify the other contracting party of such intention six months or one year in advance. At the same time he shall notify the Commission on Farm Land of the respective city, town or village so that the matter may be arranged as smoothly as possible.

Even in normal times it is necessary to settle tenant disputes rationally and as swiftly as possible in accordance with actual conditions, but this is especially true in this time of emergency. The Law, therefore, provides the following measures:

(1) Officials in charge of tenant disputes shall be authorized to place disputes under arbitration in accordance with the Tenancy Arbitration Law whenever such action is deemed necessary for the public welfare. Law courts shall also be authorized to place under arbitration any judicial case relating to tenant farms.

(2) When the Court deems arbitration necessary, it may, after consulting the officials in charge of tenant disputes, issue orders requiring the parties involved to keep the crops on the disputed land unchanged or keep the land rentals in custody, or issue orders regarding cultivation of the land during the period of negotiation so that the arbitration may be successfully concluded.

(3) In case arbitration of a tenant dispute fails, the Court may, after due consideration based strictly on the actual circumstances and after consulting the officials in charge of tenant disputes and the commission on farm land, resort to juridical proceedings in order to achieve a fair solution of the dispute.

Fifthly, the Law also provides for the settlement of agrarian disputes other than those relating to tenancy. In regard to the utilization of farm land other than tenant farms, disputes may arise in connection with relations with adjoining land. It is necessary to settle such disputes rationally, smoothly, swiftly and in a simple manner on the basis of the actual conditions. For such purposes, the proposed Law provides for a system under which the commission on farm land may adjust matters as in cases of tenant land disputes while the Courts shall also be authorized to arbitrate the disputes according to the methods applied to tenant land.

Sixthly, the Law provides for the establishment in different cities, towns, villages and prefectures, of commissions on farm land, which, in addition to the affairs referred to above, shall deal with matters connected with the creation and maintenance of independent farmers, exploitation of uncultivated land, transfer and consolidation of farm land, tenant relationships and various other questions relating to farm land, on the basis of local governmental conditions.

Production and Distribution of Rice

As has been attested by experiences in

Digitized by Google

past wars, the sending of the agrarian population and farm horses to the front and the transference of much of the remaining rural labour power to munitions and related industries has caused shortage in such power; while the reorganization of national economy on a wartime basis has inevitably brought about an insufficient supply of chemical fertilizers and agricultural implements. Prices of these materials have consequently gone up. In such circumstances, agriculture has been greatly hampered. This effect has been especially great in Japanese farming villages whose inhabitants mostly depend on their own labour and manage petty farms with small amounts of money.

While production is threatened with decline owing to these adverse causes, the consumption of rice is disproportionately on the increase not only in Japan proper but also in overseas territories, evidently because of the boom in munitions industries and the growing demands of the fighting services. In the face of these difficulties, the agricultural industry in Japan is being called on to ensure a sufficient supply of its most important article of food.

To meet the requirements, therefore, the agricultural population has spared no effort to maintain and increase, where possible, productive power, coping with altered conditions, while the Government has given necessary aid through various measures. As a result, a balance of approximately 9 million koku of rice may be brought over to the next year, according to the estimated supply and demand for the 1939 rice year.

A mere maintenance of output, however, at the level prior to the present Affair is insufficient to meet the ever-increasing consumption. It is of paramount necessity, particularly during prolonged hostilities, to ensure as much supply of rice as possible by the improvement and promotion of agricultural productive power, for the purpose of smooth operation of wartime economy; hence the necessity of the carrying out of a national programme with increased production as the definite objective. This transition to planned production has to be effected not only in Japan proper but also in overseas territories. A broad plan for the purpose has already been started.

The 1939 plan for increased production of rice in Japan proper has the objective of producing approximately 67 million koku. Success in carrying out this plan will leave a satisfactory amount of surplus to be brought over to the following rice year.

According to the plan, the total amount fixed as the objective shall be allotted to individual prefectures. Measures for the accomplishment of the aim include a proper distribution of fertilizers and other productive materials, the shifting and readjustment of labour, the establishment of the Commission for Production Planning in each prefecture, country, city, town or village, the function of which is to make investigation of and decisions on the standards of selection and improvement of species of rice, both paddy and upland, adaptable to each district, to encourage the operation of the fixed plan, to promote the cultivation of seedlings of paddy rice, and to effect the prevention of damages by noxious insects.

For general guidance there have been organized the Corps for Guiding and Promoting Production composed of officials in the Department of Agriculture and Forestry. These corps are sent to all the districts to lead local Commissions in the task of carrying out the programme, of encouraging local campaigns and movements for such purposes, and of giving practical guidance and courses and lectures on related subjects.

However, for the successful execution of the expansion plan under the current emergency in agrarian communities that are confronted with changing conditions of production, the first requisite is to effect rationalization of farm management, which is generally small-scaled and based on family labour. From this point of view, cooperative labour with the community as a unit is encouraged. In certain districts, farmers have already overcome their difficulties by the adoption of new cooperative farming methods, while the common use of agricultural machines and implements, in particular, that of the motor tiller which was thought unadoptable on small-scale farms such as those in Japan, has been considered as a practical question for the purpose of increasing productivity.

As governmental measures for control of rice in the realm of exchange, there have been in force the Rice Control Law and a set of regulations based thereon, the main objective of which has been to empower the authorities to purchase or deliver rice with official prices or to control its disposal in certain seasons by official operations so as to keep prices within the limits of the maximum and minimum prices fixed by the law. To date, these measures have operated satisfactorily. For the thor-

Digitized by Google

oughgoing execution of the rice policy, however, systematization of the process and structure of exchange is now called for.

Since producers of rice are spread over the length and breadth of Japan, managing small-scale farms under the family labour system, this particular commodity is shipped out to the market through innumerable channels from the outset of the process of its circulation. It may fall first into the hands of brokers on the spot or merchants who buy rice from the farmers only to sell it to second traders, or it may be put on common sale through the farmers' cooperative sales societies and agricultural warehouses, and then go through still more complicated courses. Thus, producers and their organizations, traders and their organizations, rice exchanges and rice markets—all of them demand their share of profit according to their own calculations.

The Government had been fully aware of the necessity of reform of the existing rice distribution mechanism, and in July, 1937, it appointed the Commission for Investigation of a new Rice Distribution System. The Commission, after thoroughgoing studies of various aspects of the question for the purpose of rational improvement of existing conditions, succeeded in drafting a Bill which was approved by the 74th Diet, and which was promulgated on April 11th, 1939, as the Rice Distribution Control Law.

The purpose of the new legislation is to keep the price of rice at a reasonable point by controlling its distribution. To accomplish this aim, the existing rice exchanges will be reorganized according to its provisions. Speculation in rice exchange quickly reflects itself in the actual price of rice. This is especially the case in time of emergency when speculation gives rise to other speculation and actual prices soar under no pressure of real demand. Then, cornering or holding of rice naturally follows, with the result that the blind hunting for greater gains of profit dislocates the social function of rice exchanges as distributing agencies. In view of these disastrous social consequences and with a view to checking speculative transactions as much as possible and to changing the exchange structure to spot transactions based on supply and demand relations, the new Law provides for the establishment of a semi-official company, under the name of the Japan Rice Company,Limited, which will be invested in by the Government and all the rice interests.

All the rice markets in Japan proper will be monopolized by the new corporation which takes the place of the existing rice exchanges and spot rice markets. Speculation in transactions in rice at the new rice markets will be strictly prohibited, at which only spot transactions on actual demands will be allowed within the limits of the maximum and minimum official prices as stipulated in the Rice Control Law; any break of these stipulations shall be interdicted. By the operation of the new law, the rice policy will become strengthened and thus be much more effective in checking abnormal rise and fall in the prices of rice, in stabilizing and normalizing prices and in ensuring smooth distribution.

With regard to the rice markets to be operated by the new company, they will be established in all the places which have been recognized as important rice distributing centres, especially in the towns where rice exchanges or spot markets are already extant, with a view to making transactions in the new markets function as the centres of all rice transactions.

The nerve-centres of the rice distribution structure will thus be created. However, for the systematization of the process of exchange, the regulation of the nerve-ends should not be neglected. The Law provides, therefore, that the brokers and dealers in rice shall be placed gradually under a licensed system, beginning with localities where such a step is deemed necessary in order to control and, at the same time, protect or improve them in conformity with the main purpose of the legislation. The Law further authorizes the competent authorities to give the traders in rice or their agents orders necessary for the effective control of rice distribution, so that the limitation of sales prices, prohibition of forestalling or holding may be effected for the purpose of ensuring adequate prices and smooth distribution.

Readjustment of Rural Debts Measures for readjusting and refinancing rural debts in Japan have been functioning since August 1, 1933, when the Law Relating to the Rural Debts Readjustment Association came in force.

According to an investigation conducted by the Department of Finance in 1912, two years before the World War, rural debts in Japan totalled some ¥750,000,000. Of that amount some 40 per cent represented individual loans

Digitized by Google

and some 20 per cent those of money lenders while 65 per cent were high-interest loans of 10 per cent and more. This shows that members of the rural population have unavoidably resorted to irrational methods of financing and consequently have suffered from the terms most unfavourable to themselves. This condition of rural debts, however, underwent a remarkable change with the outbreak of the World War which caused the national economic system of Japan to develop rapidly and her rural economic system to expand suddenly. This economic expansion, significant as it was, resulted in an accelerated increase in the amount of rural debts.

Then came the world-wide depression and the derivative panic in agriculture, following the close of the War. This slump, unprecedented in scope and intensity, broke down the economic life of Japan's rural population, leaving in consequence a huge amount of accumulated debts, estimated at between ¥5,000,000,000 and ¥6,000,000,000. Unquestionably, such a burden constitutes the cancer which not merely prevents the growth of the rural economic system but saps its strength.

Causes for accumulation of this stupendous debt may not be attributed only to the war boom and to the post-war slump; there have been major and minor causes and circumstances contributing in various ways and degrees to the creation of such a state of affairs. In order to plan for the prevention of further accumulation of debts, it is necessary that those causes and circumstances should be studied and analyzed and that preventive measures such as price policy directed at essential agricultural, forestry and aquatic products, adjustment of farm land, prevention of calamities, improvement of financial and medical facilities, and initiation of the insurance system should be carefully planned and efficiently carried out. As an immediate measure, however, the chronic cancer in Japanese agricultural economy must be operated on.

The Law Relating to the Rural Debts Readjustment Association is designed to encourage the organization of debt-readjustment associations on the basis of the principles of neighbourliness and mutual help, with a view to readjusting rural debts by carrying out plans for repayment of debts and economic regeneration worked out by the associations. The Law is not designed merely to give aid to debtors nor merely to protect creditors but to assist those who earnestly and sincerely strive to achieve economic regeneration. Creditors are therefore called upon to cooperate by making certain sacrifices and moderating original terms, in sympathetic consideration of the debtors' unfortunate circumstances, in appreciation of their sincerity, and above all in view of national purposes to reconstruct and strengthen rural communities.

Organization of the association on the geographical basis of a community where economic and other phases of everyday life are coherently interwoven is the step essential for maintaining the above-stated genius of the institution. The system of compensation for losses in connection with the special financing of the readjustment funds is a governmental measure for facilitating the operation of the undertaking. By this system the Government as well as municipalities are to share in bearing the losses which may be incurred. The Government is also providing funds at low interest for the undertaking.

A few years of operation of the Law Relating to the Rural Debts Readjustment Association showed that to employ municipalities alone as organs for financing funds was not meeting the actual needs of rural communities. The Law was therefore revised in part in 1937 and separate legislation concerning special financing of the readjustment of funds and compensation for losses was instituted. As a result, the Central Chest for Cooperative Societies, financing banks such as the Hypothec Bank of Japan, Agricultural and Industrial Banks, and the Hokkaido Colonial Bank have been designated, besides municipalities, as special financing organs. At the same time, the raising of the maximum amount to the individual beneficiary to between ¥3,000 and ¥5,000 and other improvements have been made in accordance with actual conditions in rural communities.

The revised and enlarged system, which has been in force since December 1, 1937, authorized the establishment of debt-readjustment associations, or judicial persons engaged in the undertaking of readjusting debts, for the period from the above date to November 30, 1947. Thus, it is designed that plans be worked out and carried out for readjusting debts amounting to ¥1,300,000,000 which have been contracted on irrational terms. With regard to subsidy for covering and indemnity against the losses the Government is authorized to disburse up to ¥120,000,000.

According to the data received up to

Digitized by Google

June 30, 1938, the number of cities, towns and villages where debt-readjustment associations have been established amounted to 2,514; that of the associations, 7,072 (of which 5,130 are of unlimited liability, 1,933 of reserve liability, and 9 credit cooperatives functioning as substitutes); and that of members, 220,000. Furthermore, the associations that have already completed planning for repayment of debts and for economic regeneration with the funds financed through municipalities numbered 3,614, and the funds already supplied amounted approximately to ¥34,000,000, which has been supplied from the Government low interest funds. There were also six or seven associations that had been supplied with funds through the Central Chest for Cooperative Societies. These funds amounted approximately to ¥500,000. Financing through financing banks was started in 1938.

Another measure adopted to promote the economic reconstruction of rural communities is the Law for the Temporary Settlement of Rural Debts which has been in force since June 20, 1938. This is an emergency law facilitating settlement of debts and realization of economic regeneration on behalf of families of soldiers killed or wounded in the China Affair. Although this emergency measure is closely related to that for the readjustment of rural debts in general, it does not necessarily require the establishment of debt-readjustment associations as in the case of the other measure. In view of the purpose for which this emergency step has been taken, the new legislation provides that the moderating of terms of contracts of debts, the forming of settlement plans and other matters necessary for the economic regeneration of debtors shall be taken care of by Temporary Debt Settlement Commissions to be created by prefectures. With regard to subsidy for covering and indemnity against losses, their percentages are to be twice as large as those of the ordinary rural debts readjustment system.

According to an investigation conducted by the Bureau of Economic Regeneration, Department of Agriculture and Forestry, the debts contracted by middle- and small-scale farmers amounted, at the end of August, 1935, approximately to ¥4,100,000,000. Of these debts 30 per cent represents those contracted at the interest of 10 per cent or more. Thus they are disbursing a fabulous amount as interest on their debts, an amount of money exceeding the ¥300,000,000 which is being spent annually on chemical fertilizers by the whole agricultural population.

Temporary Planning Bureau In view of the urgent need of securing adequate supplies of the principal farm, forest and marine products, an Imperial Ordinance was issued on December 3, 1938, to provide for the creation in the Department of Agriculture and Forestry of a Temporary Planning Bureau, the duty of which is to formulate plans for the maintenance and expansion of agricultural industries, to attend to the supply of such goods as are needed in conducting those industries and to attend to the adjustment of labour. The Vice-Minister of the Department of Agriculture and Forestry will be ex officio chief of the Bureau and under him will be 3 secretaries, 2 technical experts, and 10 clerks.

CHAPTER XIV

SERICULTURE AND RAW SILK

Sericulture

History

Historical records show that the raising of silkworms has been practised in Japan for more than two thousand years. It is surmised that the industry was first introduced into the country from Chosen or China, but for sometime it made but slow development, as the work was almost exclusively in the hands of the naturalized Koreans and Chinese. Following the introduction of Buddhism, and with the advance of civilization, the demand for silk gradually increased and the industry spread among Japanese farm households. After that, sericulture made steady growth until about 1,100 years ago, when, at the time of the Emperor Kammu, it made a sudden spurt and spread over half the Japan proper of those days, and in less than another century most of the remaining half of the country was engaged in silk production. Recent development made in the industry is outlined in the following table, showing the cocoon output for the past half a century.

Year	(In 1,000 kwan)	Index number
1880-1884	12,223	100
1885-1889	11,147	91
1890-1894	15,436	123
1895-1899	24,608	201
1900-1904	26,484	217
1905-1909	32,622	267
1910-1914	43,184	353
1915-1919	61,561	504
1920-1924	64,877	530
1925-1929	91,668	749
1930	106,469	871
1931	94,072	709
1932	89,550	732
1933	101,247	828
1934	87,199	713
1935	82,067	671
1936	82,892	675
1937	85,972	703
1938	75,256	615

The recent condition in the sericultural industry in Japan proper can roughly be explained as follows:

	1934	1935	1936	1937	1938
Number of agrarian families	5,617,486	5,610,607	5,597,465	5,574,879	—
Number of cocoon raising families	1,995,492	1,894,647	1,856,551	1,818,552	1,697,123
Percentage of cocoon raising families	35.5	33.7	33.1	32.6	—
Mulberry plantation area (chobu)	622,998	582,337	566,231	561,072	549,200
Egg-cards brushed (gramme)	160,829,333	151,176,726	145,651,630	143,839,117	128,071,425
Quantity of cocoon yield (1,000 kwan)	87,140	82,066	82,892	85,972	75,243
Value of cocoon yield (1,000 yen)	203,871	350,860	336,641	419,609	345,965

Cocoon-raising Industry

According to the Ministry of Agriculture and Forestry statistics the raisers of silkworm cocoons numbered 1,697,123 in 1938. The number of these cocoon raising houses decreased by 121,429 or 6.7 per cent, from that for the previous year.

The quantity of cocoons produced in 1938 totalled 75,243,647 kwan and the value was estimated at ¥345,965,329 consisting of 40,863,284 kwan of spring cocoons valued at ¥177,477,319 and summer and autumn cocoons of 34,380,363 kwan valued at ¥168,488,010.

Egg-cards brushed during 1938 amounted to 128,071,425 grammes, falling 15,767,692 grammes, or 11.0 per cent, from 1937. As regards the cocoon production, the amount and value decreased by 10,728,716 kwan, or 12.5 per cent,

Digitized by Google

and lost ¥73,644,412 or 17.6 per cent, in comparison with the year before.

Control of Egg-cards Production In view of the severe competition with rayon silk in recent years there is a sheer necessity of improvement in silk industry so as to produce silk of a more superior quality with a lower cost of production, and the question of better egg-cards comes first of all. There was no control of the preparation of egg-cards hitherto all the matter being altogether left to the hands of merchants. For long the request for an effective control on the egg-cards production by the authorities has been raised among the farmers and silk producers. Consequently, the National Original Silkworm Egg-card Control Law was promulgated in 1934. The purpose of the Law is to realize a thorough control of egg-card production by 1938 and cut down the excessive number of different kinds and squeeze out the best ten by a special committee which is to be organized by the Imperial ordinance. The original egg-cards of the best kinds thus selected and sanctioned by the Ministry of Agriculture and Forestry shall be sent to local governments where they are multiplied and distributed among sericulturists. Private establishments may reproduce egg-cards out of the original ones, but the percentage is limited to 30% against the 70% of local governments' production. The price shall be fixed by the Imperial ordinance. The local governments are granted a delay of 10 years for the completion of facilities, but, as a matter of fact the control will be completed without delay because most of local governments can immediately respond while the vacancy left by backward prefectures will be filled up by private concerns for the time being. Encouragement shall be given to an invention of better egg-cards by individuals so as to prevent the abuse of a too-strict governmental control. An annual profit of at least ¥100,000,000 is estimated at as the result of the control.

PRODUCTION OF SILKWORM EGGS

(In kg.)

	1933	1934	1935	1936	1937

Qualified by government test	271,589	272,606	244,615	205,015	226,804

Mulberry Plantation The success of the silk-worm raising industry depends upon an adequate supply of suitable leaves on which to feed the worms.

In Japan there are as many as 276 varieties of mulberry tree, and from these, 71 are selected by local government authorities as model kinds, each having its own special characteristics.

The total mulberry plantation area at the end of June, 1937 was 561,072 chobu, representing a drop of 5,958 chobu or 0.9 per cent from 1937. This was due to progress of mulberry plantation readjustment all over the country. The number of mulberry saplings that were raised in 1937 counted 257,642,851 pieces valued at ¥4,300,028.

Cost According to the investigation made by the Imperial Farmers' Association, cost of spring production in 1938 was as follows:

COST OF COCOON PRODUCTION

(For 1 kwan of the first class cocoon)

Details	Spring Crop (In yen)
Mulberry leaves	2.42
Egg-card	0.24
Labour	1.70
Cocoonery room	0.20
Duties	0.16
Miscellaneous	0.39
Total	5.11

Educational Facilities There are in Japan three special colleges for the silk industry, namely, the Ueda Sanshi Semmon Gakko, Nagano prefecture; Tokyo Sanshi Gakko, Tokyo; and Kyoto Koto Sanshi Gakko, Kyoto; besides which, there are, in different parts of the country, 16 public schools of middle school grade. Some of the agricultural col-

Digitized by Google

leges and middle grade schools also have classes dealing with silk industrial enterprises. In addition to these regular seats of learning there is a class for the practical training of silk-raisers at every sericultural experimental station established by the Government in each silk producing district, and a similar training is also given at a score of private institutes created for the purpose of diffusing knowledge on all phases of the silk industry.

The Cocoon Market The Numazu cocoon market for 1938 opened on May 28 for the first spring cocoon transactions in Japan. Usually at the Numazu market yellow cocoons are dealt in, but at the Hamamatsu market which was opened on the 27th, white cocoons were transacted. Prices of white cocoons were the highest for the last four years. High, low and average prices of the day, which formed the standard for the year's prices in this country, together with those for the preceding five years, were as follows:

		High	Low	Average
		(In yen per kwan)		
1934	white	3.09	2.59	2.92
	yellow	3.26	2.00	2.66
1935	white	4.91	4.36	4.85
	yellow	5.11	4.23	4.85
1936	white	5.30	4.28	4.68
	yellow	5.29	4.51	4.94
1937	white	5.03	5.03	5.03
	yellow	6.28	5.20	5.93
1938	white	5.17	4.98	5.06
	yellow	4.96	4.38	4.61

The Statistics Statistics on cocoon production by kind in Japan proper in the past 6 years are given below:

COCOON PRODUCTION BY KIND IN 1932-1937

(Japan Proper)

		1932	1933	1934	1935	1936	1937

Cocoon Deals

Cocoon Deals The Produced Cocoon Disposal Law was first enforced in 1937. The results were not satisfactory. Out of 67,902 kwan of cocoons transacted, only 120 kwan was delivered as dry cocoons. An expediency by which cocoons will be dried and delivered after purchase contracts are concluded was established. The Government overlooks it, considering the transitory period of the new practise. In Nagano prefecture the dry cocoon transactions were totally ignored and this caused a great trouble among cocoon raisers. Reelers are raising a protest against this system. The greatest dissatisfaction is with cocoon drying techinique by a third party. The technique is said to damage the quality of raw silk and interfere with reeling operation. Another complaint is, since the quality of cocoons differs according to places of production, climate and species, a uniform drying method is not suitable. Cost of drying makes the price higher and this is still another complaint. If the drying method is conducted by themselves, this will not damage the quality of cocoons and the cost also will be cheaper. The distribution by dry cocoon distribution guilds will make the cost of silk reeling higher. Sericulturists, too, are against the system. The reason is cocoon prices fluctuate with a change of silk price, but to keep dry cocoons for a certain period without selling them as raw cocoons will cause sericulturists uneasiness over future cocoon price. Economic condition of sericulturists does not allow them to keep cocoons for a long time. They need ready cash. Dry cocoon expenses are now shifted to sericulturists under

Digitized by Google

the law. The law thus met a severe opposition in the first year of enforcement, but with the lapse of time it is believed to be followed by all.

AVERAGE COCOON PRICE IN JAPAN PROPER PER KWAN

(In yen)

	Spring Cocoon	Summer-Autumn Cocoon	Average
1925	11.25	10.07	10.68
1926	9.28	7.33	8.35
1927	7.18	4.77	6.03

1936	5.06	4.81	4.94
1937	5.55	4.13	4.88
1938	4.26	4.93	4.60

Raw Silk

Soon after the country's entry into foreign trade, the Tokugawa Shogunate put a restraint on the exportation of silk on the ground of its scarcity and of its being a prized national production. Notwithstanding such a restrictive policy raw silk exports from Yokohama increased by leaps and bounds, as enormous profits could be made by the exporters.

With the Restoration came the encouragement of home industries, the first among them to arrest the attention of the Government authorities being the silk industry, and ever since special efforts have been made toward developing this national industry. Unfettered financial help was extended to filatures in 1915, 1920, and again in 1930, and the Government has established facilities for the promotion of all phases of silk activities, schools, silk conditioning houses and various experimental stations.

The silk reeling and sericultural industry is represented by Nagano prefecture. Suwa is located in the central part of the prefecture and Okaya (Hirano Village) in Suwa district is the most thriving and largest silk reeling centre. No other silk reeling district in the world can rival it, since Japan produces two-thirds of the world's entire silk production, and silk production in Nagano takes the foremost rank in Japan. Gumma prefecture is the next largest reeling centre with Fukushima, Aichi, Saitama, Gifu and Kyoto following.

Raw Silk in 1937

The raw silk industry in 1937 traced a stormy course on account of the business depression in America and the wartime control of commodities in Japan, although a hopeful atmosphere prevailed at the beginning of the year. The price of raw silk in the middle of January went up to ¥947.00 per picul reflecting the rising tendency of prices in the world and speculative purchases. In May, however, the price fell below ¥700.00, but with the beginning of the new silk year (July to June the following year) the price picked up again and in the beginning of July it had neared the ¥900 mark when the North China Incident occurred. The Sino-Japanese conflict and the delicate political situation in Europe greatly discouraged the raw silk markets and in November the raw silk price was put at its cheapest since June, 1936. Toward the end of the year it regained somewhat, but the cost of production had increased in the meanwhile so that the profit margin had become very slender.

Enactment of the Raw Silk Price Stabilization Law An epoch-making event in the annals of raw silk industry and trade was the promulgation of the Raw Silk Price Stabilization Law which came into force on April 1, 1937. The purpose of the law is to fix the maximum and minimum prices of raw silk in order to regulate the ups and downs in prices for the stabilization of the business. It is the last and most effective measure of all the measures employed in the past. By the proper application of the provisions of the law the future of raw silk industry and trade bids fair to become brighter. The standard price of purchase by the Government from the association of silk dealers specially organized in accordance with the provisions of the law was fixed at ¥520.00 per picul and that of sale by the Government to the association at ¥950.00 for the silk year, July 1937 to June 1938.

Production and Exports The production of raw silk of all kinds in 1936

Digitized by Google

amounted to 11,287,000 kan valued at ¥517,244,000, showing a decrease of 356,000 kan and an increase of ¥17,477,000 as compared with the previous year. The exports during the silk year, July 1936 to June 1937, amounted 525,027 piculs valued at ¥429,768,000, recording an increase of 37,768 piculs and ¥51,662,000 over the previous silk year. Shipments during the 1937 calendar year amounted to ¥407,118,000 as against ¥392,809,000 in 1936, an increase of ¥14,309,000 or 3.6 per cent.

Silk Filatures

Silk Filatures The number of Japanese silk filatures has kept falling for many years, except in 1930. The 1937 number, however, increased 3.7 per cent to 43,422 over 1936. The Government was giving subsidy to filatures for encouragement of scrapping of surplus basins in accordance with the silk reeling industry law. Thus, readjustment of medium-sized filatures made headway. Division of this number for 1937 according to the number of basins used were as follows:

Those using less than		Drop from 1935
10 basins	41,408	(+)2,051
10-50	906	326
50-100	478	158
100-300	479	33
Over 300	151	3

Of the total, filature-using machines were 1,892, re-reeling filatures were 37,418 and dupion filatures 4,112. The total number of basins for 1937 was 265,115, falling 8.8 per cent from the year before.

The number of female operatives totalled 273,026, falling 7.9 per cent from 1936 and that of male operatives 22,122, decreasing 7.5 per cent. Production of raw silk totalled 11,166,553 kwan, falling 1.1 per cent from 1936, worth ¥527,320,631 gaining 1.9 per cent. Production of silk waste totalled 3,234,206 kwan, declining 5.7 per cent from 1936, worth ¥21,484,365, declining 0.8 per cent.

Japan's Place in World's Silk Industry

According to the investigation made by the Silk Bureau of the Agriculture and Forestry Ministry the total world production in 1935 was 59,466,000 kilogrammes of which Japan (Korea and Formosa included) produced 45,520,000 kg. The 1936 world production totalled 59,425,000 kilogrammes of which Japan produced 44,198,000 kilogrammes. China with 9,409,000 kilogrammes produced the largest quantity next to Japan. Then came Italy with 3,100,000 kilogrammes. Compared with 1923, the gain made during the 10 years was 18,145,000 kilogrammes. Detailed figures of the statistics prepared at the Silk Bureau of the Agriculture and Forestry Ministry follow :

RAW SILK PRODUCTION IN THE WORLD

Silk in Japan's Foreign Trade

Exports of raw silk for 1938 totalled 477,471 piculs, including dupion, valued at ¥364,124,000. While the amount increased by 4,101 piculs from the 1937 exports, the value decreased by ¥42,994,000. The United States, as usual, made the bulk of purchases taking 393,274 piculs. Europe followed with 65,562 piculs. In the last 10 years the export quantity has not made any great change but the export value fluctuated widely.

SILK AND TOTAL EXPORTS COMPARED

(Unit: ¥1,000)

	Value of All Exports	Value of Silk Exports	Percentage of Silk
	(Japan Proper)

1925	2,305,590	879,657	28.2
1926	2,044,728	734,052	35.9
1927	1,992,317	742,266	37.3
1928	1,971,955	733,436	37.2
1929	2,148,619	784,150	36.5
1930	1,469,852	419,107	28.5
1931	1,146,981	355,394	31.0
1932	1,409,992	382,265	27.8
1933	1,861,045	390,901	21.0
1934	2,171,924	286,793	13.2
1935	2,499,073	387,032	15.4
1936	2,692,976	392,809	14.5
1937	3,175,418	407,118	12.9
1938	2,689,677	364,124	13.5

As regards the quantity, it is rather on the increase compared with 10 years or so ago. In 1923 the exports were figured at 263,280 piculs and for the following 3 years the quantity of the annual shipment never exceeded 450,000 piculs in contrast to 497,485 piculs for 1933. But this quantity for 1933 was smaller than that for any single year between 1928 and 1932. In 1934 it regained the former level, realizing a quantity next to none other than 1931 figure, and the tendency continued in 1935. But figures went down for the two years, 1936 and 1937, and in 1938 showed a slight increase. Below is given the quantity of silk exported each year for the 12 years ending 1937:

Year	Quantity of Silk Exported (picul)	Year	Quantity of Silk Exported (picul)
1927	521,773	1933	497,485
1928	549,256	1934	551,308
1929	680,950	1935	553,156
1930	477,322	1936	505,550
1931	560,577	1937	476,360
1932	548,541	1938	477,471

1938	393,426	158.8	(+) 3.4

Note: Figures slightly differ from those given in the preceding table, because they come from the report of the Finance Ministry.

Price of Raw Silk

In January, 1920, raw silk was quoted at ¥4,360 per bale of 16 kan, the highest price in the history of the country's silk business. At that time the volume of production was 360,000 bales, but during the next 10 years production increased to 730,000 bales, but unfortunately the prices did not fall in inverse ratio. Had they done so, Japanese producers would have been happy, for in June, 1932, the price fell below one-tenth that of 1920, whereas the output had only doubled. In 1933 it regained a little, but in 1934 the price fell to its lowest, and it seemed to be showing an upward tendency from the following year. It went down again in 1938, although the forecast for 1939 is most encouraging.

RAW SILK PRICE AT YOKOHAMA SPOT MARKET

CHAPTER XV

FISHERIES

General

Japan Leads On account of her unique position as a maritime country Japan's fishing industry has naturally developed from of old until today Japan occupies the first position in the world in the output of aquatic products which amounted to ¥660,813,807 in 1937 as the following table shows. These products consist mainly of fish, shell-fish, seaweed, which are used as food, fish oils and animal fertilizers.

Value of Fishery Products in 1937

Classification	Value in yen
Coastal Fishery	219,649,403
Pelagic fishery, home	89,887,033
Pelagic fishery, colonial	7,203,405
Whaling	18,747,886
Trawling	7,951,200
Fishery in Russian waters	37,598,284
Floating canneries in Kamchatka	25,808,797
Aquiculture	28,974,262
Fish manufactures	214,870,754
Isinglass	10,122,783
Total	660,813,807

Fisheries in 1938-39

Fisheries in Japan are being controlled by powerful capitalists with the progress and expansion of the industry in recent years. In 1937, the Nichiro Fishery Company which operates in Soviet waters and northern seas extended its sphere of activity to the Chishima island through the Horomushiro Fishery Company, and is going to operate in the entire area from Kamchatka to North Chishima in 1938. The areas left by the company are going to be monopolized by another company i. e. the Nippon Suisan. The three old fishery companies, the Kyodo Gyogyo, the Nippon Suisan and the Nippon Shokuryo Industry, were amalgamated into the Nippon Suisan (Fishery) Company capitalized at ¥91,500,000. The new company owns most of the floating crab canneries and cold storage equipment and specializes in trawling fishery. It is the largest Japanese fishing corporation with its activities covering the wide expanse of water from the Arctic to the Antarctic oceans.

The total exports of fishery products in 1938 amounted to ¥132,503,000. Details are given below in comparison with 1937:

	1937	1938
	(unit: ¥1,000)	
Canned crabs, salmon, etc.	86,905	92,819
Fresh fish and shell-fish	21,916	21,931
Poudered fish for fertilizer	11,159	5,182
Fish and whale oils	15,299	6,902
Hardened fish oil	9,524	4,333
Shells	—	1,336
Total	144,803	132,503

Not a small amount may be added to the total from the exports of canned salmon which the Nichiro Gyogyo Company sends to Great Britain directly from Soviet waters.

The long pending revision of the fishery convention between Japan and the Soviet Union was not realized in 1938 also, but a provisional agreement for prolonging the validity of the old convention for one year which had been concluded at the end of 1937 was repeated again early in 1939 for another year.

In the fall of 1938 and early in 1939, fishery enterprisers became united by groups for the protection of their interests and the Japan Bonito and Tunny Fishery Association, the Japan Federation of Canned Fish Manufacturers' Associations and the Fishery Products Trade Association were organized.

On May 23, 1939, the first national meeting of fishery associations was held in Tokyo, in which 800 delegates of about 4,000 fishery associations were present, and made decisions on matters relative to the promotion of the industry and a smooth supply of fishery materials which now became one of their grave concerns on account of the national economic control on such materials as rubber goods and fuel oil.

Antarctic Whaling In September and October of 1938, 5 large whalers set sail for the Antarctic. Their equipments were as follows:

Digitized by Google

Name of Whaler	Tonnage	No. of Crews	No. of Catcher Boats	No. of Gunners
Tonan Maru No. I	9,800	250	5	100
Tonan Maru No. II	19,000	334	8	—
Tonan Maru No. III	19,000	300	8	—
Nisshin Maru No. I	16,764	592	8	—
Nisshin Maru No. II	22,000	300	9	—

The Tonan Maru No. II came back to Kobé on April 18, 1939, which caught 600 whales and brought back 6,500 tons of whale-oil, 300,000 kin of salted whale and 54,000 kin of whale-skin for imitation leather.

The Nisshin Maru No. I returned to Yokohama on April 19, 1939, which caught 1,520 head, and brought back 72 tons of whale-fin, 3 tons of whale teeth, and 5 tons of whale-bone for substitute materials, and 340 tons of salted whale.

Persons Engaged in Fisheries

The fishery industry in Japan is now run on a modern industrial basis and especially pelagic fishing is developing rapidly. But by far the larger number of fishermen are still engaged in working in the old-fashioned way, generally on a small scale. In 1937, as many as 1,501,882 persons were engaged in all kinds of fishery industry, and of this number 1,200,208 were males and the rest females. Of the total number, 1,078,142 were fishermen, 152,426 were engaged in cultivation and 271,314 in the manufacture of aquatic products.

NUMBER OF PERSONS ENGAGED IN VARIOUS BRANCHES OF THE FISHERY INDUSTRY

Year	Total Number	Fishermen	Those engaged in Cultivation	Those engaged in Manufacture
1928	1,498,258	1,130,430	119,986	247,842
1929	1,490,726	1,112,002	120,933	257,791

1931	1,482,520	1,110,506	124,784	247,113
1932	1,499,040	1,106,850	141,394	250,796
1933	1,499,175	1,097,254	144,655	257,266
1934	1,521,916	1,103,346	151,007	269,563
1935	1,521,477	1,098,999	155,203	267,275
1936	1,534,432	1,102,502	154,627	277,303
1937	1,501,882	1,078,142	152,426	271,314

FISHERY EMPLOYERS AND EMPLOYEES

Year	Employers	Employees
1928	633,487	864,771
1929	633,080	857,646
1930	635,241	847,114
1931	634,699	847,821
1932	640,318	858,722
1933	635,849	863,326
1934	640,735	881,181
1935	633,435	888,042
1936	637,031	897,401
1937	619,227	882,655

Fishing Boats and Vessels

The total number of boats and vessels engaged in fishing at the end of 1937 was over 364,260, of which 297,961 were without engines, while 66,299 were with engines. The number of smaller boats, having capacity of less than 5 tons, is decreasing, while the number of vessels having engines has steadily increased. This shows an improvement in vessels and in the method of fishing.

Year	Total Number of Boats	Boats without Engines	Boats with Engines	
			Steam	Motor
1919	384,609	380,577	99	3,933
1930	359,295	323,228	159	35,908

50 tons and over	373	522	621	719	802

Coastal Fishery

Fish, shell-fish, etc. caught in 1937 amounted to ¥219,649,403, an increase of ¥7,001,383 or 3.3 per cent over the previous year, the major classification of which was as follows:

	Quantity	Value
Fish	494,481,117kan	¥162,844,491
Shellfish	37,643,983	10,451,464
Crustaceans and Mollusca	40,874,838kan	¥31,426,069
Seaweed	105,707,575	6,219,642

The amount of catches in coastal waters since 1928 is shown in the following table. In 1930-32 while the value of catches showed a gradual decrease, catches were steadily increasing, showing thereby that the decrease in value was due to decline in price caused by the depression of those years, but in 1937 the prices rose to a certain extent.

(Quantity in Metric Tons, Value in ¥1,000)

Year	Total		Fresh Fish	
	Quantity	Value	Quantity	Value
1928	2,123,777	209,264	1,469,120	156,560

1 Laminaria. 2 Porphyra. 3 Undaria pinnatifida. 4 Gelidium corneum
5 Gloiopeltis furcata.

Pelagic Fishery

Large-sized vessels with motors have increased greatly in number of late. There are over 10,000 vessels of over 10 tons, many of which are actively engaged in fishing at distances of up to 700 miles from Formosa and Japan proper. The northern seas have been opened up by floating crab canneries, and mother vessels for the salmon and salmon trout fisheries. But there are still vast undeveloped areas in the Behring Sea, the Sea of Okhotsk, the Maritime province waters, the South Seas, the South China Sea, the Gulf of Siam, and even in the Southern Pacific, so that the future for pelagic fishery for Japan is bright and of great importance to her. The following sections deal with different branches of deep-sea fishing.

In Home Waters In 1937, the number of vessels engaged was 9,783, the number of men 122,892 and the amount of catches 229,795,609 kan of a value of ¥89,887,033, exclusive of catches in colonial waters. The vessels with engines numbered 9,568, while those without numbered only 215.

Catches of principal fish are as follows :

	In 1,000 kan	In yen
Bonito	24,820	13,186,667
Tunny	9,865	12,340,259
Sea-bream	2,220	4,324,556
Flat-fish	10,723	5,611,904

The number and descriptions of vessels engaged in this fishing with their catches, since 1932, are given below:

NUMBER AND CREWS OF VESSELS ENGAGED IN DEEP-SEA FISHING IN HOME WATERS

Year	Total Number of Vessels			Vessels without Engines			Vessels with Engines		
	No.	Tonnage	No. of crew	No.	Tonnage	No. of crew	No.	Tonnage	No. of crew

Norwegian Method Followed Whaling is being carried out according to the Norwegian method. As this method requires quick movements the vessels used are small-sized ones of a capacity below 120 tons. In order to allow whales to breed and also to maintain order in the work the Government has made it a rule that whaling should be carried on only under permit. The Government furthermore restricts the number of vessels engaged in this work to 30 in seas other than the South or North Pacific Ocean. It also orders vessels to operate from headquarters placed in 18 suitable places along the coast of Hokkaido, the North-Eastern Sea, South-Western Sea and the Japan Sea.

Japanese whaling is now extending to the Antarctic Ocean and the Japanese whalers made good catches there in recent years. The total value of catches and manufactures reached ¥18,747,886 in 1937. Details follow:

Trawling Trawling in Japan is modelled after that now being carried on in the North Sea. The steam vessels engaged are from 200–300 tons in size, some being fitted with Diesel engines. A permit must be obtained from the Government before commencing trawl fishing. At present the Government is restricting trawlers in the Inland Sea, the East China Sea, and the Yellow Sea to 70 vessels. 56 vessels make Shimonoséki their headquarters, while 8 work from Nagasaki, and 6 from Hakata. It also prohibits trawlers, by special regulations, from operating in the nearby seas in order to keep the coastal water free from the devastation caused by the destruction of immature fish, etc. During the World War there was a fall in the catches by trawlers owing to the decrease in number of trawlers, but since 1921, the trawling business has again become active though the number of trawlers as mentioned above is restricted to 70. But, it was increased later and, in 1937, there were 74 vessels with 1,460 crews. Catches by trawling in 1937 amounted to 13,380,415 kan, value ¥7,951,200.

Fishery in Soviet Waters

Fishery in Russian or northern waters is an important right conceded to Japan in the Treaty of Portsmouth, signed at the conclusion of the Russo-Japanese War of 1904–05. In 1928, a new convention, under the conditions of the above Treaty was concluded for a period of eight years, after the expiration of which time the pact is to be renewed. The districts to be worked, extending from the Maritime Provinces to Kamchatka, are leased from the Soviet Union at annual auctions held at Vladivostok. (As to the disputes between Japan and Russia on the fishery question in recent years, see Chapter VI.)

In 1937 the number of fishing lots actually worked was 355, the number of steamers 141, sailing vessels 1, and the number of fishermen and others engaged in the fishing 19,858. The amount of salmon, trout, and herrings caught in 1937, was 549,858 koku in total, and the crabs caught numbred 7,759,066. Good catches of salmon and trout are made every other year, while the quantity of crabs has a tendency to become larger in recent years. The amount of salmon, crab, etc. canned was 1,155,407 cases, valued at ¥23,234,699 in 1937. In the same year the amount of salmon and trout salted reached 555,432 koku. The following table shows the number of fishing districts leased, amount of fish caught, etc.

NUMBER OF FISHERIES, FISHING VESSELS, FISHERMEN, AND PRODUCTS IN SOVIET WATERS

FLOATING SALMON CANNERIES IN KAMCHATKA

	Mother ships	Men engaged	No. of catches (in 1,000 pieces)	Canned	Salted	Value (In ¥1,000) Frozen	Eggs	Total
1934	16	5,543	8,944	8,050	1,119	988	82	10,239
1935	8	4,972	11,544	7,785	1,651	590	104	10,129
1936	6	3,478	8,796	7,409	1,760	455	67	9,691
1937	7	3,310	10,115	12,051	1,750	690	122	14,614

Floating Crab Canneries Fishing is carried on by vessels equipped with machinery for the purpose of canning the crabs on the vessels themselves. The first enterprise was made in 1921, and, in 1923, rules regulating the work of crab-manufactory vessels were issued by the Government, which also established districts where fishing was forbidden and made permits necessary before a vessel could set out to the fishery. Recently the rule has been revised, the number of vessels on the western side of Kamchatka being restricted to 18 and the amount of canned crab to 320,000 cases.

Up to 1927, Japanese only were engaged in this fishing, but in 1928 two Soviet vessels came in, in 1929 another two entered and 1930 saw a further increase.

Canned crabs manufactured by this method since 1931 are as follows:

FLOATING CRAB CANNERIES

Vessels in operation	1933	1934	1935	1936	1937
Number	9	9	9	9	9
Tonnage	40,724	37,235	34,112	36,737	36,749
Fishermen engaged	2,955	3,120	3,124	3,243	3,420
Crabs caught, pieces	9,461,587	9,930,678	11,332,000	13,948,000	14,913,197
Canned foods

Value in yen	7,476,267	7,732,616	8,429,000	9,490,000	11,193,937

Note: A case contains 22.32 kg.

Aquiculture

The conservation and cultivation of aquatic resources is very important to Japan as fish and other marine products constitute a great part of the staple diet of her people. Great care and study are being given to aquiculture in the country, the incubation and letting loose of salmon and trout and the cultivation of fish in shallow waters are being well looked after by the Government. From 1926 on, not only the incubation of salmon and trout, but also the transfer of crawfish, shad, etc., was tried several times with assistance obtained from the U.S.A. The aquicultural production for 1937 amounted to ¥28,974,262. The amount gained ¥3,422,666 or 12.4 per cent, over 1936. Of this total, production of carp amounted to ¥5,024,307; that of eels ¥5,092,320; that of oyster ¥2,022,879; that of sea weeds ¥9,987,807; and that of pearls ¥1,543,837. The principal fish, shell-fish and seaweed which are now being cultivated are carp, eel and tortoise in fresh water, and the seaweed laver in sea-water. The breeding is done in rice-fields, breeding ponds, reservoirs, marshes, etc.

The number of aquicultural establishments in 1937 was 159,038, the area covered 149,314,974 tsubo. Condition and results of the industry in recent years are given in full in the following tables:

NO. OF ESTABLISHMENTS ENGAGED IN AQUICULTURE, AREA AND PRODUCTS

Year	No. of Establishments	Area sq. metres	Value of Products (In yen)

Manufacture of Fishery Products

The supply of fish depends to a considerable extent on seasonal changes but demand is controlled by the tastes and customs of consumers, so that supply and demand are too often not well balanced. In order to adjust these difficulties satisfactorily, careful studies have been made regarding the storing and preserving of these products. Especially, as the problem of food has become a serious one lately, it is often argued that a portion of the fishes which are now being turned into fertilizers and which amount to 40% of the total yields, should be converted into food. Under these conditions Japan is paying very careful consideration to the manufacture of fishery products.

The total manufactured fishery products in 1937 was valued at ¥214,870,754, of which ¥33,115,259 was in fertilizers, ¥18,001,508 in fish oils, ¥730,026 in Gloiopeltis dried, and the balance of ¥163,023,961 was the value of food products.

MANUFACTURED FISHERY PRODUCTS

(Units: Quantity in metric ton, value in ¥1,000)

Year	Total Value	Food Products		Fertilizers	
		Quantity	Value	Quantity	Value
1933	156,294	409,081	119,926	438,117	28,843

1937	24,437,345	18,001	172,806	730

Note: Production of Japanese isinglass is not included in the table.
*Dried seaweed, Gloiopeltis furcata.

Products as Food To the present the Japanese people have not paid much attention to the manufacture of fishery products, except "fushi", as articles of food, because fresh fish is available at almost any time and any place. But since there is a large consumption of such products among people of Western nations attention has been turned to the preservation of fish with a view to export. The principal items preserved are "fushi" (fishmeat steamed and dried), fish dried, salted and dried, boiled and dried, smoked, salt-cured, canned, and Japanese isinglass. Production of each for the last few years is as follows:

VALUE OF FOOD PRODUCTS
(Unit ¥1,000)

Year	Fushi	Dried	Salted and Dried	Boiled and Dried	Smoked	Salt-cured	Miscellaneous
1933	15,628	21,221	8,300	16,794	360	9,773	47,848
1934	15,823	23,250	8,821	19,781	372	9,704	51,051
1935	14,314	22,306	10,040	22,547	289	11,859	56,117
1936	17,525	27,264	10,527	23,469	402	14,559	62,398
1937	16,948	27,124	10,103	21,999	438	19,313	67,098

Japanese Isinglass Kantén or Japanese isinglass is a gelatinous substance extracted from seaweed, especially from Gelidium amansii, used for food and industrial purposes, production of which is shown in the following table:

	1933	1934	1935	1936	1937
No. of establishments	429	449	463	512	520
Total production Quantity kg.	2,081,404	2,320,654	665,000 kan	680,000 kan	708,203 kan
Value yen	4,718,521	5,257,378	6,390,315	9,712,497	10,122,783

Fertilizers Details of the production of fish fertilizers are given in the table below. As the table shows most fertilizers are made from herrings, sardines and bonito. Where transportation facilities are not very good or where there is no satisfactory equipment for manufacturing them into food fishes are converted into fertilizers.

FISH FERTILIZERS
(Quantity in metric ton, value in ¥1,000)

Year	Total		Herring cake	Sardine cake	Fish bone cake	Sardine dried	Dried Herring	Others
	Quantity	Value	Value	Value	Value	Value	Value	Value
1933	438,117	28,843	5,121	17,750	526	966	2,300	2,178
1934	424,017	28,913	3,319	19,536	969	1,006	2,163	1,917

Manufacture of Salt

The salt industry in Japan is carried on under the Salt Monopoly Law. Salt is manufactured by the boiling method. The cost of production, therefore, is high, and the quantity produced is not enough, so that a large quantity of cheap salt is imported every year. The number of salt producing establishments, production, production areas, etc., in Japan are as follows :

March 31	No. of Establishments	No. of Manufacturers	No. of Employees	Area of Saltbeds in hectare	No. of Boiling Pans	Production
1933	3,361	3,378	36,672	4,538.48	3,804	630,835,033 kg.
1934	3,339	3,347	36,855	4,533.92	3,709	676,300,500

1937	3,239	3,221	35,310	4,561 ,,	3,641	892,905,280 ,,

Organizations Connected with Fisheries

Suisankai (Fishery Societies) Suisankai is a public corporation, recognized by the Suisankai Law of 1921, which has as its purpose the development of fishery. It is an organization covering a particular county or city and includes among its members, in addition to those engaged in fishing, persons having rights to fish and those who manufacture, trade in, or store fishery products. A prefectural suisankai is organized by county and city suisankai of that particular prefecture, and at the head of prefectural suisankai and suisankai located abroad is the Teikoku (Imperial) Suisankai. The functions of suisankai include the encouragement of fishery, the improvement and extension of the manufacture of marine products, the development of fishing districts, protection of aquiculture, etc. It also collects statistics, investigates markets, or engages in brokerage, etc. On the social side, the rescue of shipwrecked vessels, improvement of relations between employers and employees, employment agency work, mediation in labour troubles, etc., are looked after by the societies. And lectures on fishery subjects, exhibitions and fishery shows are held by them. The number of suisankai, their members, etc. during the last few years are as follows :

SUISANKAI (Fishery Societies)

	1933	1934	1935	1936	1937
Fishery Societies:—					
Total	330	349	346	344	344
County and city fishery societies	340	308	305	303	303
Prefectural fishery societies	39	40	40	40	40
Imperial fishery society	1	1	1	1	1
Number of members of societies:					
County and city fishery societies	430,767	450,276	450,696	444,135	447,496
Prefectural ,, ,,	336	304	296	294	299
Imperial ,, ,,	42	42	43	43	43
Expenditure of fishery societies (yen)	1,778,277	1,932,159	1,644,675	1,545,577	1,672,326

Suisankumiai (Fishery Guilds) There are two classes of suisankumiai. The first of these is a corporate judicial person, organized by fishermen or those who are engaged in the manufacture or sale of aquatic animals or plants in a particular district for the purpose of the encouragement and improvement of

Digitized by Google

fishery, cultivation and propagation of aquatic products, etc. The number of suisankumiai is decreasing gradually. At one time there were as many as 220 or more of these Kumiai or guilds. In 1937 there were 65, with a membership of 41,274 and an expenditure of ¥1,180,-528. The Act for Suisankumiai in Foreign Waters promulgated in 1902, authorizes any Japanese engaged in fishery or in the manufacture or sale of aquatic products in foreign waters, either by permit or by treaty, to organize suisankumiai. At present Roryo Suisankumiai (Suisankumiai in Russian Waters) is the only one which belong to this class. This guild is formed by fishermen and those engaged in the manufacture and sale of aquatic products in the Maritime Province, Kamchatka, and Saghalien Island. In 1937, its members were 26. Its especially important task is to encourage amicable relations between the Japanese and Russian fishermen working in the same waters and thus ensure the smooth and effective working of the industry in those parts.

Gyogyo-Kumiai (Fishermen's Societies) Gyogyo-Kumiai is a judicial person recognized by Fishery Law, and is organized by fishermen living in a particular district. It acquires fishery rights, etc., for member fishermen and takes any measures necessary to further or protect the common benefit of its members.

The principal object of gyogyo-Kumiai is the acquisition of fishing rights, etc. This is quite natural in Japan for fishermen work with their village as unit and no fisherman can work independently. Therefore, fishing rights are mostly secured by gyogyo-kumiai, special privileges being given to the kumiai for securing them.

Though in the original Act, the object of gyogyo-kumiai was restricted to the acquisition of fishing rights, etc, the Act was revised in 1910, whereby the kumiai had the obligation put on them of undertaking any proper measures that would redound to the mutual benefit of fishermen.

Gyogyo-Kumiai Rengokai are corporations of gyogyo-kumiai. Their principal functions are joint sales of fishery products, cultivation of fish and rescue of shipwrecked vessels. Their history and number are as shown below :

GYOGYO-KUMIAI (Fishermen's Societies)

No. of societies classified	1932	1933	1934	1935	1936
according to no. of members (total)	3,957	3,930	3,994	4,000	3,998
under 50	1,262	1,271	1,257	1,223	1,198
51—100	892	904	923	933	928
101—200	1,004	975	973	1,694	1,719

501—1000	109	120	124	124	123
1001 and over	20	23	25	26	30
No. of members of societies	555,734	570,056	574,328	580,103	594,710
Federations of societies					
No. of federations	69	70	72	74	74
No. of member-societies	917	925	926	941	975

Dogyo-Kumiai or Related Associations Dogyo means the same trade or profession, hence Dogyo-Kumiai are associations of those connected with the same trade. In relation to the fishery industry they are formed by those dealing in aquatic products, canned foods, salt, cultivation of fish, etc. In 1937, there were as many as 21 dogyo-kumiai connected with the fishing industry. There is also the Dai-Nippon Suisan Kai, which is incorporated for the purpose of the improvement and encouragement of fishery.

CHAPTER XVI

FORESTRY

Introduction

Japan is one of the few countries of the world favoured with extensive forests. The area of forests and fields in Japan including Korea, Formosa and Saghalien Island, was 45,299,105 hectares at the end of 1933 and was about 67% of the whole area of the country, which is 67,538,527 ha. It is about 3.8 times as large as her agricultural land.

Since Japan forms a long narrow chain stretching north and south from the northern extremity of the Kurile Islands to the southernmost point of Formosa, and since her mild climate is very favourable for the growth of plants and trees, it is natural that there should be a thick growth of many varieties. There are as many as 1,500 kinds, of which principal forest trees alone number more than 100. In point of richness in variety, she occupies a high position even among countries which are favoured with larger forest areas. While the amount of timber produced is valued at roughly ¥300,000,000 annually it is still far less than 10% of the value of the total staple products of the country and is not at present enough to fill domestic requirements. Every year it is necessary to import about 10,000,000 koku of lumber, equivalent in value to ¥100,000,000. Furthermore, forestry offers very limited labour opportunities. As compared with agriculture, which gives work to one-half of the total families in Japan, and fishing, which finds employment for 1,500,000 people, the number of persons engaged in forestry is small, being less than 720,000.

Distribution and Character

Forests in Japan stand, roughly speaking, in four different zones : sub-tropical forest zone, evergreen broad leaved forest zone, the deciduous broad-leaved forest zone and coniferous forest zone.

The Sub-tropical Forest Zone This covers the whole of Formosa, the southern half of the Loochoo Islands, including the Yayéyama Islands, annual mean temperature in it being over 21° C. As to the altitude, the zone varies from below 2,000 metres above sea level in the southern part of Formosa to below 1,000 metres above sea level in the northern part of the same island. In this zone, binroji, tsuga, (Arenga saccharifera) basho-banana and bamboo are found.

The Evergreen Broad-leaved Zone This comprises Shikoku, Kyushu, the northern part of the Loochoo Islands and the southern part of Honshu (Main Island) (at 36° N. Lat. and Southwards), the annual mean temperature of this zone being 13°–21° C. As to the altitude, it is 854 metres on an average in Kyushu, 762.5 metres in Shikoku and 610 metres in the southern part of Honshu. Trees which grow in this zone are kusunoki (Cinnamomun camphora, Nees), oak, akamatsu (Pinus densiflora), white fir, tsuga (Tsuga sieboldi, Carr), etc.

The Deciduous Broad-leaved Zone This zone covers the northern part of Honshu, the southern part of Hokkaido and a greater part of Korea, the annual mean temperature in this zone being from 6° C. to 13° C. As regards the altitude, it is from 976 metres to 1,372.5 metres in the northern part of Honshu and 457.5 metres in the southern part of Hokkaido. Trees which grow in this zone are cedar (the Japanese cyress), white fir, todo-matsu (Abies sachalinensis, mast), ezo-matsu (Picea ajanensis, Fisch), beech poplar, white birch, etc.

The Coniferous Zone This zone covers the northern half of Hokkaido, the group of the Kurile Islands and the Saghalien Island, the mean temperature of which is 6° C. to below zero. This zone starts at the height of 1,000 metres in Honshu and ends at the height of 2,592.5 metres in the same island, while it ends at the height of 1,067.5 metres in Hokkaido and 610–762.5 metres in Saghalien Island. Principal trees which grow in this zone are ezo-matsu and todo-matsu.

Forests in Kiso district extend over mountain regions which range from 305 metres to 3,050 metres above the sea level along the course of the upper stream of the River Kiso. It covers 104,055 ha. in area and its growing stock amount to 28 million cu. m. Principal trees are the Japanese cypress, the swamp-cypress, sawara (Chamae cyparies obtusa, S. et Z), nezuko (Thuja japonica, maxim) and parasol-pines.

Digitized by Google

They are old and are thickly grown. The reason that they are retained so well is due to the fact that during the feudal times, the cutting down of these trees was prohibited. Among these, the most magnificent trees are the Japanese cypresses which are about 190 years old. Most of them are 0.46 metre in diameter and 27.45 metres in height.

Forests of sugi in Akita district are widely distributed along the Yonéshiro and Omono Rivers, and belong to the Government. The forests cover an area of about 43,000 ha. and hold stock of 16 million cu. m. The forests, where they are not mixed with other trees, are beautiful and magnificent to look upon. Most of the sugi in these forests are from 120 to 200 years old, and in a dense part the stands hold as much as 1,400 cu. m. per ha. Some of them are so large that their diameter reaches sometimes to 1.22 metres. The forests are noted for the abundance of timbers of a superior quality. Annual cutting from these forests amounts to 280,000 cu.m.

Area of Forests, etc.

According to the report of the Ministry of Agriculture and Forestry the area of forests in Japan proper was as follows :

(In Japan proper the investigation on the area of forests, bamboo-groves and wild lands (productive yet uncultivated) is carried at the year end every third year.)

AREA OF FORESTS, BAMBOO-GROVES AND WILD LANDS IN JAPAN PROPER

(In hectares)

Year (At the year end)	1930	1933	1936 (In chō)
Grand total	23,011,218.74	23,645,731.85	24,186,376
Forested tracts	19,879,240.86	20,575,913.91	21,035,861
Coniferous	4,632,827.81	5,420,360.80	5,658,563
Broad-leaved	8,470,016.53	9,086,657.13	9,007,564
Mixed	6,148,369.59	5,454,838.83	5,758,616
Bamboo-groves	136,329.23	148,348.25	152,684
Miscellaneous	491,697.70	465,708.90	458,434
Bare tracts	3,131,977.88	3,069,817.94	3,150,515
Crown	1,432,649.16	1,413,885.42	1,380,087
National	7,638,263.28	7,657,609.80	7,712,934
Public	4,186,375.15	4,287,336.00	4,444,567
Temple and shrine	141,381.03	144,269.56	152,904
Private	9,612,550.12	10,142,631.07	10,495,885

Stock of Growing Timber

Japan Proper To ascertain the amount of growing timber owned by the Imperial Household, Government, and public and private interests careful investigations are made, the investigations in the case of public and private interests being carried out by each prefecture. The following statistics show the growing timber in Japan proper in 1933 classified according to ownership: (Quantities in 1,000 cu. m.)

Kind	Crown	Government	Public and Private			Total	%
			Public	Shrines and Temples	Private		
Coniferous trees	32,452	139,948	71,172	7,333	327,510	578,415	46.0
Broad leaved trees	14,121	323,431	83,503	5,000	252,823	678,878	54.0
Total	46,573	463,379	154,675	12,333	580,333	1,257,293	—
%	3.7%	36.6%	12.4%	0.7%	46.6%	—	—

Thus the total standing timber in Japan proper (Hokkaido excluded) is 1,257,293,000 cu.m., of which coniferous trees account for 578,415,000 cu.m. and broad-leaved trees 678,878,000 cu.m.

Other Parts The following table shows the number, ownership and type of trees in other parts of the country.

Total	1,191,903	1,296,763	2,488,665

Afforestation

There is great scope for the practice of afforestation in Japan because of the large wild areas, plains where there is only a thin growth of trees, and forests where there are many undesirable trees. However, since a great deal of timber is being cut, reforestation becomes more urgent every year.

Afforestation is divided into two classes, viz., natural and artificial. Natural afforestation is being carried out in only a small portion of the Crown and Government forests, while in most of the public and private forests, conditions are such that no definite plans for natural afforestation have been made. However, as this is liable to cause forests to go to waste careful studies are being made to improve the situation.

In artificial afforestation Japan has had some good experience and artificial afforestation for the Imperial and Government forests is being carried out on a well-planned basis.

New Plantation Area newly planted in 1937 was 118,065 cho, and the number of trees planted was 340,557,533, of which coniferous trees numbered 278,715,478 while broad-leaved trees numbered 50,417,523. The number of trees planted in the Crown owned area in the same year was 11,424,532.

In addition to the above there were 56,993,134 trees supplementarily planted in the forests in 1937, and bamboo-groves newly cultivated were 867.9 cho in area and 1,058,650 in the number of bamboos planted.

Naturally Regenerated Area of forests naturally regenerated in 1937 was 240,820 cho.

ARTIFICIAL AFFORESTATION

(Area in cho)

Year	1935	1936	1937
Area newly planted	109,728.9	119,472.7	118,065.4
Number of trees newly planted	328,020,522	356,350,597	340,557,533
Coniferous area	84,964.3	95,935.4	95,649.7
Number of trees	258,386,282	288,684,326	278,715,475
Broad-leaved area	19,309.9	18,436.7	18,200.9
Number of trees	54,178,683	52,808,322	50,417,523
Crown area	5,454.7	5,100.6	4,214.8
Number of trees	15,455,557	14,857,949	11,424,532

Production of Wood, Bamboo and Other Forest Products

The total value of forest products in 1937 reached ¥432,434,950.

Area of wood and bamboo lands cleared and the value of wood and bamboo produced in recent years were as follows:

	1935	1936	1937
Area cleared in cho	412,012.5	455,398	445,873.7
Total Value in yen	168,761,410	194,840,000	254,991,282
Timber	113,868,550	136,933,000	189,088,543
Fuel wood	52,365,708	55,153,000	63,218,575
Bamboo	2,527,152	2,754,000	2,684,164

During the ten preceding years no marked fluctuation has been observed in movements of quantities of timber and fuel wood produced, while, on the other hand, their value has been showing annually more than moderate decreasing trend until 1934 when it turned to increase.

Value of other forest products in 1937 amounted to ¥177,443,668. Details follow:

Kind	1935	1936	1937
Seeds of trees	47,328	44,716	56,022
Fruits (Chestnuts, Walnuts, etc.)	3,637,943	4,297,997	4,306,391
Barks	2,317,412	2,512,932	2,901,405
Loan grass	17,051,201	18,432,950	21,423,867
Fresh mushrooms (matsutaké)	4,547,224	4,394,132	4,891,987
Dried mushrooms (shiitaké)	4,282,318	5,505,551	4,822,663
Bamboo sprouts	4,143,188	4,888,931	5,202,223
Horse-radish	1,565,726	1,744,885	1,658,627
Charcoal	90,814,783	101,796,857	131,460,169
Total including others	129,083,727	144,347,118	177,443,668

Protective Forests

Besides having a direct value through the produce they yield, forests have a distinct indirect value through influence on climate, conservation of water supplies, prevention of erosion, etc., and in order that the fullest use may be made of them the Government established a system of "protective forests." In the following instances, under the Forestry Act, the Government is authorized to decree that certain forests, etc., shall be considered as "protective forests":

(1) When it is necessary to protect against soil denudation.
(2) When it is necessary to protect against sand shifting.
(3) When it is necessary to protect against flood, wind and tide.
(4) When it is necessary to protect against avalanches and rolling stones.
(5) For conservation of water supply.
(6) For fishery purposes.
(7) For guiding navigators.
(8) For public health.
(9) For scenery.

The area of protective forests in 1933-37 was as follows:

Owners of protective forests, etc., cannot, according to the provisions of the Forestry Act, cut down the trees, take the forest products from them nor utilize them for any purpose, unless with the approval of the authorities concerned. Protective forests are divided into two classes for administrative purpose. In the first class are forests in which limits for cutting and utilization are fixed, while in the second are those, the cutting of which is absolutely prohibited. Any owner who has his forest included in the second class and suffers any loss by this inclusion will have the loss reimbursed by the Government.

Utilization of Government Forests

Forests are classified according to ownership as Crown forests, Government forests, and public and privately owned forests. Public and privately owned forests include those possessed by shrines and temples, public corporations and private individuals. Crown forests are those possessed by the Imperial Household and are divided into the hereditary and ordinary ones. Both are under control of the Minister of the Imperial Household, and are in charge of the Bureau of Imperial Forests and Estates. Government forests in Hokkaido are looked after by the local Government of Hokkaido, while those in Honshu (Main Island) are taken charge of by the Department of Agriculture and Forestry. Growth of forests, their utilization, and work of ensuring the public welfare through them are looked after by these offices, which administer them with rational plans for the public welfare.

The Government makes a contract

Digitized by Google

with people willing to carry on afforestation work whereby they are given not more than 80% of the total profit on condition that they follow the Government's instructions as to planting, supplementary afforestation work, and taking care of the trees planted. "Divisional Forests" may be established for this work. A portion of the Government's forests may be put into the custody of shrines and temples and any profits arising therefrom may be used by the shrines and temples. Such forests constitute "Forests in Custody." Sometimes the Government may appoint a particular city, town, or village to protect Government forests which are situated within the jurisdiction of that city, town or village, payment for the work being made by part of the products of that forest being handed over to the city, town or village (Commission forests). In addition, the Government may lease its forests for the purpose of the development of industry in a particular district, or for the purpose of assisting people living near the forests. In some cases no rent is charged. The ground may be used for grazing, grass, or gathering fuel. The Government may sell some of its forest land if it is suitable for reclamation. Forests which are used for these purposes are of a vast area. Figures for March, 1935 follow:

Protective forests	930,049 ha.
Divisional „	43,863
Forests in the custody of shrines and temples	25,584
Commission forests	55,998
Forests leased for industrial purposes	75,713
„ for grazing	119,409
„ as grass fields	162,338
„ for gathering fuel	1,010,615
„ „ reclamation	23,602

Taxes cannot be imposed on Government forests which come within the area of any city, town, or village. But in view of the fact that it owes a great deal to the city, town or village for controlling and managing these forests, the Government has decided to pay to that particular city, town or village a sum equivalent to the amount of the local tax which those forests would bear if they were owned by private individuals.

Forestry Associations (Shinrin Kumiai)

Forestry associations are those judicial persons recognized by the Forestry Act of 1907, which are formed not for profit but for safety of the country, conservation of water supplies, protection of forests, etc. The nature of their work is to allow members to plant, fell, carry, guard, or sell timber under unified control and rational management. Forestry associations are classified according to their objects into four classes, viz., foresters' associations, business associations, coolies' associations, and protection associations.

The number of forestry associations in 1937 was 2,373, and the area covered was 1,922,002 cho. The growth of forestry associations in recent years is shown in the following table:

FORESTRY CO-OPERATIVE SOCIETIES

(Area in cho)

Year (At the year end)	1933	1934	1935	1936	1937
Total					
Number of societies	1,734	1,919	2,083	2,235	2,373
Area operated by societies	1,259,575	1,441,681	1,642,146	1,793,768	1,922,002
Number of members	243,753	278,111	325,172	359,048	389,921

Forest Damage and Insurance

Forests are subject to damage by fire, wind, snow, etc., damage and loss by fire being especially great. As the forestry business requires an investment which covers a long period of years it is essential to insure, for if a forest is swept by fire, not only the capital invested, but also the care and labour of many years is instantly swept away. The table below shows both the amount of loss and the area damaged by fire, wind, etc., during the last few years. In order to encourage forestry work some means to minimize the loss which arises from fire had to be devised. For many years forest insurance was looked for but it was not until 1920 that the Toho Fire Insurance Co., Ltd., ventured to take on this business. The Teikoku Fire Insurance Co., Ltd., and

Digitized by Google

Tokyo Marine and Fire Insurance Co., Ltd., quickly followed. The first two companies insure only those artificially cultivated forests which are older than ten years, while the Tokyo Marine and Fire Insurance Co., Ltd., will insure the artificially planted forests which are not ten years old as well as naturally grown forests.

Damages done to forests in 1937 reached 321,506 cho with an estimated value of ¥16,978,093.

Forest Administration

The central office of forestry administration in Japan at present is the Forestry Bureau in the Department of Agriculture and Forestry. Under this Bureau, there are six Forestry Administration Offices, 218 Forestry Administration Stations and 1,544 administrative districts.

In the office of the Forestry Bureau there is a Section of General Affairs, a Section of Forestry Business, and for the administration of privately owned forests there is a Public and Private Forests Section. For experimental work there are, under the direct supervision of the Minister of Agriculture and Forestry, Forestry Experimental Stations. Forestry Administration Offices are located in Aomori, Akita, Tokyo, Osaka, Kochi, and Kumamoto cities, and are under supervision of the Minister of Agriculture and Forestry. The work of each office is to plan the afforestation work of Government and public forests, to establish or eliminate Government forests, to start civil engineer-

Digitized by Google

ing work, to sell forests, etc. They also supervise the works of forest administration stations which are placed under them. In each office there is a Section of General Affairs, a Section of Forestry Planning, a Section of Afforestation and a Section of Utilization.

Forest Administration Stations, which number 218 in all, are directly concerned with the management and protection of Government and public afforested forests.

In Hokkaido, the Forestry Section in the Development Bureau is the central administration office, and under it there are 19 forest administration offices. About 3,520,000 ha. of forests which are owned by the Government are administered by these 19 offices, the average area controlled by one office being about 185,000 ha.

Forestry Education

College Education Forestry education in Japan began with the establishment of a forestry school in Nishigahara, Tokyo, in 1882, under supervision of the Forestry Bureau. This school became the Tokyo Forestry School and by the University Ordinance of 1890 was incorporated as a branch of the Department of Agriculture of Tokyo Imperial University. Morioka and Kagoshima Higher Forestry Colleges were established in 1903 and 1904 respectively. The forestry education that was being carried on in Sapporo Agricultural College in Hokkaido, became a laboratory course when the college became a Department of Hokkaido Imperial University. During the World War, facilities for education were greatly extended, and Departments of Forestry were added to Kyoto and Kyushu Imperial Universities, while higher forestry colleges were established in Miyé, Utsunomiya, Gifu, Miyazaki, and Suigen in Korea and Taihoku in Formosa.

Each university and college has its own speciality. Kyushu and Hokkaido Universities give lectures on Forestry in Tropical and Arctic Zones respectively, and graduates of these universities are mostly working in the colonies. Each university has forests for experimental purposes.

Most higher colleges are comparatively new but each of them has its own speciality. Some of them have two-year post-graduate courses, while others offer some special courses. Miyé Higher Forestry College is noted for its course in civil engineering for forestry, Gifu Higher Forestry College for its technological course on forestry products, and Utsunomiya for courses on agricultural policy and economics. Gifu Higher Forestry College is specialized in its courses on clearing and carrying lumber making on a mechanical basis, chemical technology of forestry products, etc.

Practical Education The first and second class forestry schools established and supervised by various prefectures give practical lessons in forestry. They exist either as independent schools of forestry, or as a part of agricultural schools.

In order to encourage forestry, training of experts who have practical knowledge of forestry is very important. These experts are trained mostly in the forestry schools which give practical lessons, but often other methods, as explained in the next section, are adopted.

Supplementary Education For those who have no opportunities to get regular forestry education in schools supplementary forestry education is given in various places, the principal method being by series of lectures given under the auspices of forestry experimental stations, forestry associations or charcoal associations. These lectures are given regularly each year, but in particular cases, when experts are required for the purpose of management of some special forestry work a special course of lectures will be given. In the case of Government forests, supplementary education is given every year to train men who take charge of the forests.

Forestry Experimentation

Central Experimental Station A plant experimental station was first established in Nishigahara, Tokyo, in 1878, to make investigations into the advantages of the cultivation of various plants, the growth of plants, the relation between the forests and climatic conditions of the country, etc. This station was abolished in 1822, but in 1890, the business of forestry experiments was taken up by the Forestry Administration Station of Tokyo. Later, in 1905, upon a pressing need, plant nursery beds were established in Meguro, Tokyo. This nursery developed into a Forestry Experimental Station under supervision of the Forestry Bureau. In 1922, the station was detached from the Forestry Bureau and placed under the direct supervision of the Minister of Agriculture and Forestry. A subsidiary station was also established in the Ogasawara (Bonin) Islands for the purpose of experimenting with tropical plants.

In the Central Experimental Station

Digitized by Google

there are departments of general affairs, afforestation, vegetable pathology, utilization of forestry products, chemistry, forestry work, and weather and climate. Since 1904 it has regularly issued bulletins on experiments and forest weather, besides occasional other reports. The Station will, for payment, make analysis, carry out experiments and give advice and judgement on matters of forestry for the general public, if requested.

Local Experimental Stations Among the various prefectures Hokkaido is the only one which has a forestry experimental station. It was established in 1908 and for twenty-five years has contributed to the development of forestry in that island. The station makes expriments in afforestation, the utilization of forestry products and the protection of forests. In Kagoshima prefecture, a forestry research bureau was established in 1929. This bureau studies plant rearing, afforestation, etc. and is the only bureau which engages in experimental work in prefectures other than Hokkaido.

Forestry experimentation in Formosa is undertaken by a Forestry Bureau under the Central Research Station in the Government-General of Formosa. It has experimental forests of 52,000 cho. In addition to experiments in afforestation, utilization, and nursery work, it studies the classification and distribution of plants grown in the island. It has two branch stations.

The forestry experimental station in Korea was established in 1922. As the climatic conditions in Korea are rather continental the kinds of plants, their distribution, and the nature of forests, etc. differ widely from those in Japan, so the results of the experiments made in the Central Experimental Station in Tokyo cannot be directly applied to the forests in Korea. The station is comparatively new, but as part of a plan which is to be completed in fourteen years beginning 1925, investigations on the classification and distribution of plants, experiments in rearing and the planting of principal trees, experiments in the prevention of damage from noxious insects and fungi on young plants and forests, tests on lumber and methods of storing, etc., have already been made and reports on the results of the investigations and experiments have been published in the bulletins issued by the station. In the experiments on rearing young plants it has already succeeded in showing the way to quicken their growth, its experimental success in rearing the Korean pines being specially noteworthy.

In Saghalien Island an experimental station was established in 1929. Prior to that experiments were made on frigid zone plants by the Temporary Industrial Investigation Bureau in the Government Office of Saghalien Island in experimental forests near the towns of Toyohara and Horo.

Lumber Trade and Industry

Lumber Trade Imports of American lumber in 1938 amounted to ¥9,770,000. It was a great drop as compared with 1937 in which the amount reached ¥30,077,000. The main causes of the decrease were in the trade control of the Government. And the total amount of lumber imports reached ¥28,178,000, a decrease of ¥36,639,000 over the previous year.

Lumber Price The lumber market in 1938 extremely arose, because of the decrease of the imports of foreign lumber. January quotation of American lumber was ¥24.70 per shakujime (about 1 cubic foot×12), and it rose to ¥32.50 in July, then dropped to ¥26.13 in November and the year average was ¥28.45. The Saghalien timber was quoted at ¥970 per 100 koku (koku—about 1 cubic foot×10) in January, ¥1,130 in March, ¥1,100 in September, again ¥1,130 in December, and year average ¥1,084.

IMPORTS OF LUMBER (In ¥1,000)

Year	Ebony, Kwarin, etc.	Teak	Cedar for Pencils	Cedar, Pine, Fir from under 60 mm. thick to over 200 mm.	Cedar, Pine and Fir (logs and cants)	Kiri (paulownia)	Aspen	Other Wood

Wood Pulp Industry

Demand for pulp in Japan during 1937 gained considerably over the year before, both production and imports increasing heavily over 1936, as mentioned in connection with rayon and paper manufacturing industries in other chapters.

The 1937 production of wood pulp in Japan was 829,684 metric tons, the timber consumed for the manufacture of pulp 8,687,899 koku. The amount of wood pulp imported amounted to 466,608 metric tons valued at ¥116,720,000. In 1938, it decreased to 144,724 metric tons valued at ¥41,059,000.

PRODUCTION AND IMPORTS OF WOOD PULP
(In metric tons)

	Production	Imports
1933	620,039	159,974
1934	708,996	225,261
1935	757,477	269,853
1936	802,565	326,467
1937	886,978	466,608
1938 (estimate)	1,001,228	114,724

Promotion of the Industry The Board of Planning adopted a five-year programme for increase of wood pulp production in Japan and Manchoukuo in order to realize self-sufficiency in pulp in the country. According to the five-year programme the present productive capacity of 871,000 tons is to be expanded to 1,350,000 tons in Japan proper while the imports from Manchoukuo are to be increased from the present quantity of 13,200 tons to 300,000 tons by the end of 1942.

CHAPTER XVII

MINING

History of the Industry

During the reign of the Emperor Kotoku (645 A.D.), a mineral deposit was discovered in the province of Iyo and experts came over from Korea and China, to work the minerals extracted. Metals were being used for making coins, so mining received the encouragement of the rulers. During the time of the Emperor Shomu, (724–747 A.D.) mineral deposits were found in many places and the art of working them made considerable advance, a fact witnessed by the construction of the Great Buddha at Nara, a monument of the metal-working art of those days.

Later, during the time of the Ashikagas, mining made further development, especially in the field of gold, copper and sulphur. Influential lords who held sway in their own localities required metals to finance their army, and mines always proved good objects for fights. Mineral deposits obtained in this manner were well worked and the mining industry naturally developed.

In the time of the Tokugawas metallurgy further advanced. The government coined money which circulated all over the country and naturally the industry was well protected and carefully developed under its ægis. At this time Japan was known throughout the world as a country which abounded in gold and silver, and after the country was opened up to foreign trade the quantity of these precious metals exported was considerable, a business which provided a natural stimulus to gold and silver mining. The government also encouraged private enterprisers to engage in the industry, a result of which was the entry of the Sumitomos. The chief mineral deposits discovered during those times were :

Ashio Copper Mine	in Tochigi
Besshi „ „	in Ehimé
Sado Gold Mines	in Sado Island
Miiké Coal „	in Fukuoka
Karatsu „	in Saga

After the Meiji Restoration the industry did not show much progress until after the Sino-Japanese War of 1884–1885, when the Government called in many mining experts from abroad and employed them in government operated mines, not only to improve, organize and work the mines more efficiently but also to teach the operating of them on a modern basis. The mines improved in this manner were sold to private companies, and the experts who were officials of the Government were transferred together with them, a factor which served to bring the mining industry of Japan to its present stage of development.

In all kinds of mineral products, the year 1935 witnessed considerable increases over the preceding years. This was caused by the enormous increase of overseas trade and the continued boom of munitions industries. The year 1936 far surpassed the productions of the preceding years, setting an all-time record. An upward price trend caused miners to produce more than ever before.

Speaking of gold, the 1937 output totalled 13,184 kilogrammes in contrast to 21,114 kilogrammes for 1936. Silver production, too, decreased and amounted to 184,391 kilogrammes against 298,-793 kilogrammes for 1936. Copper was not exception to the rule. Its output totalled 48,823 metric tons against 78,-114 metric tons for 1936. Coal production totalled 24,278,000 metric tons against 38,067,000 metric tons for 1936. Petroleum products for 1937 totalled 2,272,-631 hectolitres contrasted to 3,820,462 hectolitres for 1936. Production of sulphur totalled 140,502 metric tons, gaining over the 1936 figure of 175,314 metric tons. Production of lead was the largest known for recent years with a total of 5,521 metric tons against 8,021 metric tons for 1936. Demand for zinc became heavy with the progress of munitions industry. Last year's production totalled 26,835 metric tons in contrast to 36,201 metric tons for the previous Year. Tin decreased somewhat and totalled 949 metric tons for 1937 against 1,859 metric tons for 1936. Throughout these two years the constant measures of encouragement of the Government and heavy demand for munitions industry provided the background for the large production.

* Brown or soft lignite.

The amount of mineral production in 1937 is not made public. But there is no doubt about the fact that it must have reached over 800 million yen, judged from the increase in the amount of taxes received by the Government from mining industry as it is shown below:

Year	Tax on Mineral Products	Special Tax on Mineral Products (In Yen)	Tax on Mine-lots	Total including others
1933	1,427,504	—	2,177,341	4,729,453
1934	1,701,007	—	2,600,445	5,886,661
1935	1,914,517	—	2,841,083	6,167,640
1936	2,204,200	—	3,071,534	7,112,929
1937	3,036,308	420,428	3,707,908	9,708,944

Mining of Metals

Gold Lacking natural resources, Japan today depends on importation from foreign countries for a large number of materials for armaments, munitions and various capital goods. Semi-finished goods are particularly needed in con-

Digitized by Google

nection with defence-centred economy. However, the greater the importation of goods, the worse will become the already adverse international balance of trade. Hence, it is necessary to adopt feasible measures to maintain equilibrium in international accounts while attempting to import adequate amounts of goods needed. Promotion of the export trade constitutes one of these measures. Through concerted efforts on the part of the Government and the people, Japan's export business has continued to advance in the face of high tariffs, import quota systems and various other restrictive measures adopted by other countries. Simultaneously, the Government has introduced the Foreign Exchange Control Law, the Law Concerning Adjustment of Foreign Trade and Allied Industries and the Law Concerning Temporary Measures on Exports and Imports. Through these measures it has been attempted to adjust foreign trade by prohibiting or restricting imports of goods which have been considerd unnecessary or non-urgent.

The remaining methods of bettering the international balance and maintaining the foreign exchange position of the yen on a sound basis is to replenish funds for settlement of foreign exchange, and one of the most effective measures is to increase the production of gold within Japan. The Government has made substantial appropriations for various gold production measures, notwithstanding the large expenditures required for other undertakings.

Since 1932, the Government has enforced many policies concerning gold: the purchasing of gold at current market prices; the reduction of railway freight rates on gold ore; the reduction of fees for analysing gold ore at the Bureau for Supervising Mines; the subsidization of construction of gold refineries, and the guiding of operations of gold mines on minor scales. As a rsult, the production of gold has increased considerably. In Japan proper alone, in 1936, it amounted to more than 22 metric tons valued at ¥74,820,000, whereas in 1931 only a little over 12 metric tons of gold valued at ¥16,500,000 were produced. Production in the Japanese Empire, including Taiwan and Chosen, which was about 22 metric tons, valued at ¥26,840,000 in 1931, increased sharply to more than 41 metric tons worth ¥138,560,000 in 1936.

However, even this latter amount is inadequate at the present time. The Government therefore promulgated the Gold Production Law which went into effect on August 28, 1937, with a view to increasing production of gold in an aggressive manner and to concentrating the precious metal in governmental hands so that it may be utilized in equibalancing international accounts. In conjunction with the execution of this law, the Government is encouraging gold production with a sum of approximately ¥22,580,000 to be spread over five years from the 1937 fiscal year.

For the promotion of gold mining industry, the Government also introduced the Law Concerning the Japan Gold Production Promotion Company, Limited, at the 73rd session of the Imperial Diet in 1938. Approved by the Diet, the law was promulgated on March 29, 1938. The company organized under this law is a special semi-governmental corporation whose functions is to facilitate supply of abundant funds for gold mining enterprises and also to undertake various promotional enterprises in connection with the industry, such as the refining of poor ores.

On May 2, 1938, the Government raised its buying price of gold from the former level of ¥3.77 per fine gram to ¥3.85, the current level of the world gold market. On May 9, it abolished the gold buying commission which had hitherto been levied, and reduced by 50 per cent the rates of refining fees charged by the Mint on gold bullion to be sold to the Government, the rates of fees on certificates of the quality of gold bullion and those of fees on testing. At the same time, the buying commission on gold bullion in small lots below 50 grammes was abolished.

The essential points of the Gold Production Law may be listed as follows:

1. Persons desiring to engage in the business of gold refining and of buying minerals containing gold are required to secure licences from the Government.

2. Persons who have acquired minerals containing gold or alluvial gold or any substance containing gold are required to refine them into gold bullion and to sell the latter to the Government, or to sell them to licensed gold refiners or buyers of minerals containing gold. When these buyers have refined the bullion, they are obliged to sell it to the Government. Thus, all newly refined gold is to be concentrated by the Government, irrespective of the channels through which it may be obtained.

3. Gold refiners are required to formulate their plans of operation in advance and to report them to the Gov-

Digitized by Google

ernment. Reports are also required concerning changes in plants. The Government is authorized to order alterations in the plans of the refiners.

4. Whenever it is deemed necessary for the augmentation of gold production, the Government may, on the recommendation of the Gold Commission, command gold refiners to expand or improve refining facilities and may give necessary instructions concerning such facilities.

5. Owners of mining rights and rights on alluvial minerals containing gold shall be treated in the same manner as gold refiners, with respect to business operations.

6. When it is deemed necessary for the public welfare, the Government may, on the recommendation of the Gold Commission, issue orders to persons who are engaged in gold mining, gold refining and buying of minerals containing gold.

7. The Government is authorized to demand reports from gold miners, gold refiners and persons engaged in the business of buying minerals containing gold concerning their business methods and assets, and may also investigate such matters. The Government may further issue supervisory orders regarding the accounting methods of the above persons or may take the necessary action.

8. When it is deemed necessary, the Government may, on the recommendation of the Gold Commission, issue orders regarding the price of gold, restrictions on the use of gold and other matters relating to the consumption of gold. This provision has been put into force through Ordinance No. 60 Concerning Regulations on Gold Consumption of the Department of Finance, promulgated on December 28, 1937.

9. Machinery, tools or other materials necessary in the business of gold miners or gold refiners, when imported with the approval of the Government, shall be exempted from import duties for a period of five years from the day on which the Gold Production Law went into effect.

10. The Government may give subsidies to gold miners or gold refiners within the limits of the amount fixed in the budget.

Measures for encouraging the production of gold are roughly as follows:

1. To give subsidies to those prospecting for gold mines.

2. Subsidization of construction of facilities for selecting and refining ore.

These measures are to be carried out in accordance with the provisions of the Gold Production Law. Procedures relating to these measures are provided for in Ordinance No. 22 Concerning Gold Production Encouragement Regulations of the Department of Commerce and Industry, promulgated on October 10, 1937. Other measures are:

1. To subsidize expenses covering institutions for training the field staffs of gold mining companies.

2. To survey mineral deposits in gold producing areas.

3. To hasten the disposal of applications for gold mining licences.

4. To lend machinery and tools for gold mining.

A summary of the prospectus of the Japan Gold Production Promotion Company, Limited, is as follows:

1. Organization of the company: This company is to be a special joint stock company organized under a special law.

2. Purpose of the company: To conduct operations necessary for the promotion of gold mining and refining.

3. Capital: ¥50,000,000, of which ¥25,000,000 is to be invested by the Government. The capital may be increased on the approval of the Government.

4. Officers: (a) The company shall have a president, vice-president, three or more directors and two or more auditors. (b) The president and vice-president shall be appointed by the Government; their term of office shall be four years. Directors shall be appointed by the Government from among the shareholders of the company; their term shall be three years. Auditors shall be elected from among the shareholders at a general meeting; their term shall be two years.

5. Business: (a) Financing of and investment in gold mining and refining enterprises and in enterprises for the manufacture of gold mining and refining machinery and tools. (b) Gold mining and refining. (c) Buying and selling of gold mining and refining machinery and tools, and other materials or equipment. (d) Buying and selling of minerals containing gold. (e) Survey and valuation of gold mines.

6. Debentures: (a) The company is authorized to issue debentures under the name of the Gold Production Debentures up to an amount five times the paid-up capital of the company. (b) The Government may guarantee the payment of the principal of and interest on such debentures.

7. Dividends: (a) The company shall not be required to pay dividends on the Government-owned shares until

Digitized by Google

private shares have been satisfied to the extent of 4 per cent per annum. (b) In case the profits to be divided among shareholders reach a ratio exceeding 4 per cent per annum on private investments and the company intends to declare dividends at a higher rate, distribution of such excess profits may be made on the Government shares and private shares at ratio of 1 to 5, until the company becomes able to declare dividends of equal rates on both kinds of shares.

8. Subsidization of dividends: When the amount of profits to be distributed among shareholders fails to reach the rate of 4 per cent per annum on private investments, the Government shall subsidize the company with an amount covering the deficiency for the first year of its operation and for the subsequent five years. However, each subsidy cannot exceed the combined total of a sum equivalent to 4 per cent per annum on private investments and a sum of interest paid on Gold Production Promotion Debentures, with the exception of the first one.

9. Tax exemption: (a) The company shall be exempted from income tax and business profit tax for the first and the subsequent 10 business years. (b) No local taxes shall be levied on this company.

10. Subsidies: The Government may grant subsidies to the company principally for its enterprises relating to refining of poor ores.

11. Government supervision: (a) The Government is authorized to supervise the business of the company. The company is required to obtain approval from the Government regarding increase of capital, issuance of Gold Production Promotion Debentures, other borrowings, changes in the Articles of Corporation, disposition of profits, resolutions on amalgamation with other companies or dissolution, and business plans. (b) The company shall observe the Government's supervisory orders and orders necessary for the promotion of gold producing enterprises. (c) The Government shall appoint supervisors of the Nippon Gold Production Promotion Company in order to supervise the business of the company.

12. Regarding the organization of this company, the Government shall appoint an Organization Committee, which shall make all preparations and follow the necessary procedures.

The foregoing explanations apply to governmental policies in Japan proper. In Korea, the Decree on Gold Production was promulgated by Imperial Ordinance No. 16 of September 7, 1937. This Decree is similar in substance to the Gold Production Law of Japan proper. In Formosa, the Gold Production Law is to be enforced as in Japan proper in accordance with Imperial Ordinance No. 518 of September 25, 1937.

The Japan Gold Production Promotion Company intends to increase the production of gold throughout the Empire. It will conduct business in Korea and Formosa as well as in Japan proper.

Silver Affected by the bounds and leaps in the silver quotations in foreign markets and o account of the close relationship of silver with gold smeltering the production of silver increased too, the 1935 production amounted to 256,004,834 grammes, which advanced to 303.753,000 grammes for 1936. Average silver price in 1937 in Osaka was ¥51.24 per kilogramme, a little cheaper than that of 1936 which was ¥51.85.

Tin Only about one-fourth of the total demand is being met by home products. To be exact 1,218,000 kg. was produced at home in 1934 againt the total home consumption of 5,260,000 kg., leaving a balance of 4,062,000 kg. to be imported and 20,000 kg. for exports.

Osaka Tin Refinery Guild was established in October, 1933. The reproduced tin put out by the members of the guild became such an important factor that its manufacture came to be designated as one of the principal industries by the Government in November, 1934. The sales of the product have been well regulated after the formation of the guild. Before the guild was organized the product contained a good deal of impurities and the production was only two or three hundred tons. As the time went on the technique of refining improved and the production in 1934 went up to five hundred tons. All the product is consumed in the domestic market, the average price in 1937 being ¥527.95 per 100 kilogramme in the Osaka market.

Copper Production of copper, unlike that of tin, lead, zinc, or aluminium, was comparatively large in Japan, occupying an important position among metal industries, especially in arms industry. Copper industry developed rather early in Japan. Its production in 1876 was less than 4,000 tons, but Japan was then known throughout the world as the second largest copper producing country, exporting one half of her product. But with the Great War as the turning point, her position as copper exporting country became less important, for new copper beds were discovered in Chile and Congo. Japan then came to occupy the fourth position

Digitized by Google

in the production of copper, and has been compelled to become an importer, the quantity imported increasing every year.

Demanded as an indispensable requisite in the munition manufacturing industries its brisk tone was maintained in 1934 as it had been in the previous year. The 1936 copper output in Japan established a record high with 77,973,000 metric tons in contrast to 69,829 metric tons for 1935. The copper market in Japan was long under influences of New York and London markets. But since the second half of 1932, owing to the depression of the yen and the increased tariff, it began to regain an independent position of foreign influences. Copper prices in Japan for 1936 were unusually high affected by New York and London quotations. Last year's low was ¥79.-65 on January 13 and high was ¥107.35 on December 4. The range was ¥27.70. In 1937, the average price of electorolytic copper rose to ¥139.96, a record high. The exports of copper reached 211,554 piculs valued at ¥15,105,-000 for 1937 and 113,456 piculs valued at ¥8,636,000 for 1938.

To meet the enhanced demand copper mines extended their equipments, the most important being the improvement of the furnace at Naoshima refinery of the Mitsubishi Mine, the extension of Saga refinery of the Nippon Mine, and opening of a new shaft at Ashio Mine of the Furukawa interests.

SUPPLY AND DEMAND OF COPPER (Kilogrammes)

	Production	Imports	Total	Exports	Home Consumption
1932	71,876,557	1,966,600	73,843,157	23,121,600	50,721,557
1933	69,032,756	17,617,700	86,650,456	8,512,100	78,138,356
1934	67,002,270	51,368,300	118,370,570	12,621,600	105,748,970
1935	69,407,000	65,261,000	137,441,000	72,000	134,170,000
1936	78,614,000	47,794,000	129,607,000	7,000	127,524,000

Lead The home production of lead barely satisfies 7% of the aggregate demand. In 1936 the total home production was 8,883 metric tons, and the import was 97,822 metric tons.

Zinc The origin and development of zinc mining in Japan is of comparatively recent date. In 1900, a Swiss clock firm, seeing bright prospects of developing the industry, purchased many zinc mines in the country and began exporting the metal. From this time the industry developed, the number of men engaged in mining increased, and the exportation of zinc grew in proportion.

Along with the development of other industries has been an advance in zinc smelting. With increased demand during the World War, production and exports increased, the quantity produced in 1917 reached 54,700 metric tons, and smelting furnaces numbered 16. From the slump of 1920 and the depression which followed it, the industry received a heavy blow. Most of the furnaces were shut down, and only those in Miké, Takata, and Hiroshima were able to weather the storm. The last named has been especially successful in manufacturing sulphuric acid with the sulphur separated from zinc ores.

Zinc ores in Japan exist mainly in igneous and aqueous rocks. They seldom exist independently, sometimes being found mixed with lead ores. The principal ore which yields zinc is zinc sulphide, some of the best of which contains about 67% of zinc and 33% sulphur. Ordinary ores contain 40 to 55% of zinc and 24 to 28% of sulphur. The principal places of production are as follows :

Kamioka Kozan in Gifu Prefecture
Budé „ „ Niigata „
Ikuno „ „ Hyogo „
Yasuda „ „ Nagasaki „
Hosokura „ „ Miyagi „
Kanayama „ „ Wakayama „
Wanibuchi „ „ Shimané „
Sasu „ „ Nagasaki „
Ginya and Maden Kozen in Heiando, Korea
Mimuné Kozan in Keiando, Korea.

The production, import, export, and consumption of zinc follow :

Year	Production Quantity produced kg.	Value yen	Imports kg.	Exports	Consumption kg.
1931	25,407,089	4,471,742	24,633,600	—	50,040,789
1932	27,043,432	6,032,611	26,571,600	—	52,615,032
1933	30,657,632	9,746,995	32,525,600	—	63,183,232
1934	32,145,458	9,516,702	33,208,100	—	65,353,558
1935	34,191,000	—	45,842,000	—	80,034,000
1936	39,066,000	—	61,774,000	—	97,975,000

Digitized by Google

Iron and Steel Industry

Down to the Meiji Era The art of iron smelting is said to have been known even in prehistoric times in Japan, but no reliable record can be found. The granites found in large quantities in the Chugoku districts, i.e. Okayama, Hiroshima, Tottori, and Shimané prefectures were found to contain a good percentage of magnetite iron from which iron dust was extracted. These places became famous for their iron products and swordsmiths. In the middle of the 19th century, there were as many as 300 smelting works in these districts, but before the Restoration the utility of iron was not well realized and the demand for it was naturally small. Therefore, the iron and steel industry in its modern garb can be said to have begun with the Restoration.

Since the Restoration Early in the Meiji Era, mines were mostly operated by the Government. As the iron and steel industry was considered very important from a military standpoint the Government placed Kamaishi mine in Iwaté prefecture, under its direct management, and established there some smelting works with foreign experts called from abroad. In 1879, two furnaces with capacity of 25 tons each were installed, but, owing to a shortage of raw materials and fuels the enterprise failed.

After the Sino-Japanese War of 1894–1895, the necessity of establishing the iron and steel industry for manufacturing war supplies was very keenly felt, and the Yawata Iron Works was established in 1886. Owing to the increased demand for iron and steel by various expanding industries the Yawata Works were extended in 1906 and again in 1911.

Private iron and steel works have since been established in rapid succession. In 1905, Suzuki Shoten of Kobé established Kobé Seikojo, and in 1907, Nippon Seikojo was established at Muroran with English and Japanese capital. In 1912, Nippon Kokan Kaisha, Ltd., was established, while in Manchuria, Honkeiko Baitetsu Koshi was established in 1910 on joint account of Japan and China.

These iron and steel works expanded tremendously during the World War, and production increased with marvellous rapidity. The 1913 production of pig iron was 240,000 metric tons while the 1918 production had increased to 583,000 tons. During the same period the production of steel increased from 255,000 tons to 537,000 tons. The Mitsubishi Co. established their Iron Works in Kenjiho, Korea, about this time.

Perhaps the iron and steel industry received a heavier blow than any other from the slump of 1920, a blow that was intensified by the decisions reached at the Disarmament Conference of 1921. The price of pig iron fell from ¥541 per ton, the highest price, in July of 1918 to ¥65 per ton is 1921, steel bars fell from ¥451 to ¥132, and steel sheets from ¥1,285 to 199. Twelve pig iron manufacturing companies, four steel manufacturers and six steel materials manufacturing companies went out of business. Many small companies were amalgamated with or absorbed by bigger ones, until at present the whole iron and steel industry is controlled by a few powerful houses, Mitsui, Mitsubishi, Sumitomo, Okura, Asano and Okawa.

Many new industries were started during the Great War and as they progressed their demand for iron and steel expanded. Production increased to meet this demand and the 1923 output was greater than at any time during the Great War. The industry received blows from the great earthquake of 1923 and the financial panic of 1927, but with the finances of the largest concerns of the country behind it re-adjustments were soon made and as demand increased the industry steadily developed.

Iron Industry in 1937

Iron industry in the country and foreign trade of iron and steel have been put under a strong Governmental control since the outbreak of the China incident in 1937, by the enactment of the Iron Manufacturing Industry Law which was passed at the 71st session of the Diet in the summer of that year. The new law, while exempting all iron manufacturing concerns in the country from taxation makes it compulsory for them to ask the permission of the Government for any changes in their working programme, and enables the Government to order the necessary changes.

In April 1937 the Minister of Commerce and Industry announced a scheme for abolishing customs duties on imports of pig iron for a year and increasing the annual production of pig iron to 5,600,000 tons and that of steel to 6,000,000 tons by the end of 1941. Accordingly, the expansion scheme of the Japan Iron Manufacturing Company was to continue for several years to come and new furnaces

Digitized by Google

were to be installed in Hyogo and Korea while its existing factories were to be greatly expanded. But the occurrence of the China incident expanded the requirements and the Konoé Cabinet which came to power in June, 1937, drew out a five-year programme for expanding the production of iron in order to realize an annual output of steel amounting to 10,000,000 tons in Japan and Manchoukuo combined. To increase the supply of steel for special purposes the curtailment of the production of iron bars and rods for peacetime enterprises was enforced as from October, 1937. At the same time regulations governing all factories using iron and steel were issued, and Governmental license was made necessary for any building in which more than 50 tons of iron bars and rods are used, the law coming into force on October 20, 1937. The supply and demand relations are also brought under a thorough Governmental control. All phases of iron and steel manufacturing industries and trade are kept in secret since the second half of 1937.

Steel Competitive rearmament programmes adopted by the leading countries of the world have resulted in a remarkable increase in demand for steel and the steel manufacturing industry in Japan has been witnessing unprecedented activity, as shown in the following table. The production in the latter half of 1937 is not made public, but it may be safely said that it reached an amount far surpassing the corresponding period of 1936.

SUPPLY AND DEMAND OF STEEL

(In 1,000 tons)

	Production	Imports	Exports	Domestic consumption
1936				
First half	2,066	144	223	1,987
Second half	2,514	141	195	2,460
Total	4,580	285	419	4,446
1937				
First half	2,454	294	212	2,535

Pig Iron and Waste Iron The problem of increasing the production of pig iron had been a long-standing one in Japan, and after the Hirota Cabinet came into power in 1936 it was became the subject of one of the most important policies of the Government. Installation of additional furnaces was encouraged and exemption of pig iron from customs duty was proclaimed. Early in 1937 the Hayashi Cabinet established a scheme for increasing the annual production of pig iron to 5,600,000 tons by the end of 1941. The Japan Iron Works made preparations for increasing production in conformity with the Governmental plan and, at the same time, succeeded in concluding a contract with American companies for the importation of pig iron amounting to 150,000 tons during 1937. According to the Japan Iron Works' plan the production of pig iron in 1937 was to increase by some 500,000 tons, the amount of supply expected being 3,700,000 tons or an increase of 15 per cent over the previous year. Actual production and imports of pig iron in 1936 and 1937 was as follows:

PRODUCTION AND IMPORTS OF PIG IRON IN 1936 AND 1937

(In 1,000 tons)

	Production		Imports	
	1936	1937	1936	1937
January	233	191	62	65
February	220	185	71	56
March	239	228	91	57
April	231	231	85	54
May	241	230	94	64
June	231	212	101	102
July	239	—	67	117
Total for the year	2,869	—	978	—

Note: Figures for production have not been published since July and those for imports since August.

The imports of waste iron amounted to 1,356,000 tons in the first 7 months of 1937. Figures for the rest of the months of that year are missing, but the fact that those for the first 7 months alone were getting close to the total of the 12 months of the previous year indicates the increased activity of steel manufacturing industry in 1937.

IMPORTS OF WASTE IRON IN 1936 AND 1937

(In 1,000 tons)

	1936	1937
January	47	74
February	56	94
March	72	84
April	72	136
May	119	223
June	118	356
July	164	409
Total	648	1,356
Total for the year	1,497	

Iron Ore Deposits in Manchoukuo and North China Iron ore deposits in Ja-

Digitized by Google

pan proper and Korea are estimated at 200,000,000 tons and the domestic supply of iron ore meets but 24 per cent of the demand the remaining 76 per cent coming from abroad. With the increase of output in Manchoukuo Japan may reduce imports of the metal from Western countries to 50 per cent of the demand. The percentage is hoped to diminish still further with the exploitation of iron resources in North China. The total iron ore deposits in China and Manchoukuo were estimated at 1,000,000,000 tons according to "An Outline of Mining Industry in China," or 555,000,000 tons according to the "Iron Ore Deposits and Iron Industry of China" by F. R. Tegengren, and approximately 90 per cent of which is in the five provinces of North China and Manchoukuo. The quality of these ores is said to be poor and the results of their exploitation are regarded very uncertain. Nevertheless, Japan may be able to get a good supply of iron ore from these districts for years to come through the efforts of skilful engineers and the application of modern scientific methods.

SUPPLY AND DEMAND OF IRON ORES IN JAPAN PROPER

(In metric tons)

Year	Amount produced	Amount imported	Amount imported from Colonies	Amount exported to Colonies	Demand	Percentage of Production to Demand
1930	245,991	1,973,659	278,727	2,466	2,504,900	21½
1931	208,181	1,549,919	176,565	5,176	1,929,509	20
1932	226,722	1,432,409	151,603	4,200	1,856,400	20
1933	320,670	1,523,627	255,320	5,600	2,093,900	28
1934	431,600	2,131,916	180,500	5,500	2,738,500	22
1935	515,800	3,404,099	242,100	5,700	4,156,400	18
1936	620,400	3,780,100	242,700	—	4,643,200	19
1937 (up to July)	—	1,856,800	1,009,700	—	—	—

Pig Iron Pig iron is produced by Nippon Seitetsu Kabushiki Kaisha (Japan Iron Manufacturing Company). Coke is mostly used in its production, the amount produced with charcoal being so small that it is hardly worth mentioning. The amount of production classified according to the mode of production and raw materials from which it is produced is as follows:

Year	From Iron Ore		Reproduced	From Ores	Total
	With Coke	With Charcoal

1935	—	—	—	—	1,906,700
1936	—	—	—	—	2,007,500

During the war, Japan had the bitter experience of having her supplies of iron and steel cut off from Great Britain and the United States of America, and in view of this the Nippon (then Yawata) Works has steadily extended its production capacity. The 1930 production was 2.5 times that of 1919.

Japan requires about 1,500,000 tons of pig iron every year. Her own production is not enough to meet this requirement and the shortage is filled by importing from Korea, Manchoukuo and India.

Steel and Steel Materials Steel ingots are produced mostly from pig iron, principally by the open-hearth process. The Bessemer process is sometimes employed by small mills, but the number of mills which use either this or the crucible method is small. Recently the electric process of production has been gaining ground. The amount of steel produced by different methods are shown below.

PRODUCTION OF STEEL INGOTS (in metric tons)

Method of Production	1929	1930	1931	1932	1933	1934	1935
Open hearth	2,238,198	2,225,451	1,828,823	2,325,306	3,456,347	3,633,610	4,459,737
Bessemer	1,210	35	—	940	—	—	—
Electric	52,654	62,140	52,765	69,740	137,600	208,790	241,649
Crucible	1,778	1,711	1,537	2,296	2,192	1,120	1,200

The annual requirement of steel materials in Japan is about 3,500,000 tons. The production in the country has greatly increased of late and in 1935 and 1936 it was able to meet the domestic demand. The following statistics show how the demand is met.

SUPPLY AND DEMAND OF STEEL MATERIALS (in metric tons)

	1931	1932	1933	1934	1935	1936
Production	1,662,858	2,113,637	2,863,155	3,805,184	3,976,000	4,538,500
Amount imported	265,548	235,165	409,862	426,658	357,100	344,900
Total supply	1,928,406	2,348,802	3,273,017	3,731,842	4,333,300	4,883,500
Amount exported	203,547	299,867	435,297	254,955	811,100	887,900
Home consumption	1,724,859	2,048,935	2,837,720	3,476,887	3,522,200	3,775,600

Coal Mining

Coal surpasses all other mineral products both in quantity and money value, the 1936 production amounted to 41,803,000 metric tons with an aggregate of ¥305,537,000. Both the output and value for the year were the heaviest for 10 years since 1926. Compared with the 1935 production, the output gained 4,076,509 tons and the value ¥35,359,984.

The year 1936 was the most prosperous year for the coal industry. Details follow:

SUPPLY AND DEMAND OF COAL

(In metric tons)

	1935	1936	1937	1938
Coal actually marketed	37,762,000	41,000,000	38,941,000	42,495,000
Coal imported	4,049,000	4,189,000	4,429,000	3,741,000
Coal stocks at the beginning of	657,000	722,000	—	—
Total coal supply	42,468,000	45,911,000	—	—
Coal exported	1,019,000	1,112,000	1,024,000	769,000
Coal stocks at the end of	722,000	698,000	—	—
Coal demand in Japan Proper	40,727,000	44,101,000	42,607,000	45,477,000

Japan's coal production since 1913 follows:

(In 1,000 metric tons)

1913	21,315	1921	26,220	1929	34,257
1914	22,293	1922	27,701	1930	31,376
1915	20,490	1923	28,948	1931	27,987
1916	22,910	1924	30,110	1932	28,053
1917	26,361	1925	31,459	1933	32,523
1918	28,029	1926	31,426	1934	35,924
1919	31,271	1927	33,530	1935	37,762
1920	29,245	1928	33,860	1936	41,803

Business results of the coal-mining companies in recent years were:

Year	No. of companies	Authorized capital (In yen)	Reserve fund
1928	105	386,413,700	26,868,288
1931	87	865,800,700	30,149,827
1934	113	470,097,200	60,394,926
1937	184	620,964,906	85,004,467

	Net Profit (In yen)	Dividend	Net loss
1928	11,711,498	7,142,008	13,011,829
1931	4,424,070	4,183,130	5,654,419
1934	30,716,855	19,847,553	995,199
1937	50,082,609	31,368,706	2,342,734

Coal Deposits No survey of coal resources was undertaken between the years 1911 and 1931, but in the latter year the Mining Bureau of the Depart-

Digitized by Google

ment of Commerce and Industry commenced a survey which took 2 years to complete. The results, compared with the 1911 survey, are :

Investigation in 1932

	Anthracite Natural Coal	Bituminous Coal	Lignite	Total	%
Amount, already mined	29,888	984,130	6,965	1,020,483	5

Possible deposits	132,093	6,278,211	275,113	6,685,417	40

Investigation in 1911

	Coal	Lignite	Total	%
Amount, already mined	283,200	—	283,200	3
Amount, unminable	—	—	—	—
Amount, minable	8,792,000	347,570	9,139,450	100
Percentage	86%	4%	100%	
Amount minable				
Actual deposite	822,000	75,770	897,770	10
Probable deposits	2,940,000	205,000	3,145,000	34
Possible deposits	5,030,000	66,700	5,096,700	56

Note: "Amount unminable" indicates the deposits, such as portions between pits, officially prohibited regions and where no pick is allowed.

"Probable deposits" as judged geologically and from conditions of coal seams and which can be presumed as available in future.

"Possible deposits" represent the deposits imagined to be there and are the most uncertain of all.

Petroleum

Production The home yield of crude oil until about 1916 was approximately 2,600,000 koku, by no means sufficient to satisfy domestic demand. Notwithstanding yearly increase in demand output was unable to keep pace with it so that by 1927 domestic production was only able to satisfy 25% of the home consumption. The percentage has since increased and in 1932 was about 44%.

According to investigations conducted by the Nippon Petroleum Oil Company, the most important producer of crude oil, wells with a daily output of 20 kilolitres (approximately 111 koku) and over numbered no more than the following 7.

Location	Name of Well	Date	Depth	Daily Output during 10 Days after Successful Date
Kashiwazaki	Warimachi Ro Style No. 3	Jan. 6	1,240 metres	24.64 kilolitres

„	Warimachi Ro Style No. 36	July 20	1,264 „	60.60

Supply and Demand One of the most conspicuous features in the oil production for the five years, 1931–1935 was the marked increase in the use of foreign crude oil in the manufacture of heavy oil. The amount for 1935 set an

Digitized by Google

all-time record of 35,837,000 cases, one case being 9.5 gallons, far larger than the preceding four years. The supply of the heavy oil manufactured out of home crude oil for 1935 was fairly heavy, second in amount from a previous record of 3,017,310 hl. for 1931. For three years following 1931 the amount was falling, but the 1935 amount gained again, due to a rapid growth of demand at home. The amount of home consumption for 1936 was the heaviest known so far. Below are given detailed figures on the supply and demand of oil :

SUPPLY AND DEMAND OF OIL (in hl.)

(1 case=9.5 gallons)

Classification	Year	Production From Home Oil	Production Erom Foreign Oil	Total	Imports
Gasolene Oil	1932	628,474	3,105,810	3,734,284	4,401,440

Artificial Petroleum In view of the necessity of developing artificial petroleum industry as a means of covering the shortage of the resources of natural petroleum in this country, the Government formulated a plan to establish a company with a capital of ¥100,000,000 to take charge of the task.

At present, the annual consumption of petroleum in this country amounts to approximately 3,000,000 metric tons, not including the demand of the Imperial Navy. As the domestic production still remains in the neighbourhood of 300,000 metric tons, the nation has to look for 90 per cent of its demand in foreign petroleum, mainly supplied by British and American oil interests. The policy for the compulsory storage of a fixed amount of oil by foreign oil concerns in the country is merely a negative meaure like the policy for economizing petroleum.

Compelled by the present extraordinary international situation to take positive measures, the Government has resolved to establish the artificial petroleum industry by three methods comprising technical assistance, financial assistance through government investments, and encouragement for products.

The Fuel Research Institute of the Ministry of Commerce and Industry, which is located at Kawaguchi City in Saitama Prefecture, has succeeded in its experiments aiming to transfer from the laboratory to the plant the manufacturing of artificial petroleum by the three processes of low temperature, dry distillation, direct liquefaction and synthesization of oils. This success has led to the decision to establish a model State-managed plant in the Hokkaido at a cost of some ¥20,000,000 as an enterprise spreading over a period of three years beginning with the 1937-38 fiscal year.

Unlike the private enterprises which have already been placed on industrial basis, the enterprise of the Ministry of Commerce and Industry, which is undertaken through the creation of a new department in the Fuel Research Institute, will be featured by an attempt to lower the production cost through rationally employing the aforementioned three processes. The minimum amount of annual production required for placing the enterprise on industrial basis is estimated at 20,000 tons. When this State enterprise proves successful, additional plants on the same scale are expected to be established in other suitable places.

It is to be noted that in undertaking to embark upon the enterprise, the Government also aims at the training of technicians to be charged with the task of guiding the private enterprises. In other words, the new department of the Fuel Research Institute will play the role of a pilot of new enterprises.

The organization of a ¥100,000,000 investment company as a semi-official concern was decided upon in view of the necessity of the Government extending financial aid to the industrialists for embarking upon the enterprises of national importance. According to the

Digitized by Google

tentative plan, the new company will be called the Imperial Fuel Company and will aim at the annual production of 2,000,000 tons of artificial petroleum, including 1,000,000 tons of volatile oil and 1,000,000 tons of heavy oil.

This aim is to be attained through the execution of a seven-year programme. For this purpose, the Government has decided to authorize the new company to issue debentures to a total amount three times that of its capital (or five times in case the capital fails to reach ¥100,000,000 due to a curtailment of the budget estimates). In order to encourage private investments, it was also decided to gurantee a dividend of 3.5 per cent during the first three years and of 5 per cent later on for the private shares of the company, with the government shares receiving no dividend in case the profits of the company do not amount to 5 per cent.

With a view to the sound development of the artificial petroleum industry, the Government has decided to enforce a control through the adoption of the licensing system for the industry. Not only the enterprises to be launched in the future but the already commenced enterprises also are required to obtain the license so that they may enjoy the privilege of securing the investments of the semi-official investment company referred to above. It is estimated that all the enterprises will involve a huge sum of ¥700,000,000 upon the completion of the six-year programme, comprising ¥400,000,000 in the investments of the semi-official concern, ¥200,000,000 in the investments of enterprisers and ¥100,000,000 in the expenses for 10,000,000 tons of coal liquefaction to produce 2,000,000 tons of artificial petroleum.

The production costs of artificial petroleum products are estimated to average ¥0.8 per gallon under the existing circumstances while the present quotation of gasolene is ¥0.51. Through the imposition of a gasolene tax as well as the raising of the tariffs, the Government expects to advance the prices of petroleum by about ¥0.10 per gallon. This, however, would still leave a margin of around ¥0.20 between the production cost and market price and accordingly, the Government plans to adopt a compensation system.

CHAPTER XVIII

THE TEXTILE INDUSTRY

The number of operatives, mills, etc. for almost all kinds of textile industry in 1937 showed an increase over those of 1936, indicating that the industry as a whole was very prosperous in that year. The following table shows these figures :

NUMBERS OF OPERATIVES, MILLS, ETC. IN TEXTILE INDUSTRY IN 1937 AS COMPARED WITH THOSE IN 1936

Kind of Industry	No. of Mills		No. of Mills using Motors		No. of Officials		No. of Technician	
	1936	1937	1936	1937	1936	1937	1936	1937

Cotton Industry

The control imposed on imports of raw cotton necessitated a curtailment of over 43 per cent in spinning industry during 1938, and as a result, the exports of cotton tissues dwindled to 2,180,000,000 square yards, a decrease of 462,000,000 square yards or 17 per cent as compared with the previous year.

Business Results According to the report of the Japan Cotton Spinners' Association on the business results of 76 member companies for the first half of 1938 the paid-up capital reached to ¥604,629,000, and the shares and loans increased by 9 million yen to be invested in expanding the scope of the factories, extending busiess to North China, and developing side lines. Net profit, reserves, and the average rate of dividend all increased.

The Cotton Industry in North China According to the 1937 statistics the area of land used for cotton cultivation in China totalled 3,500,000 hectares and production of raw cotton amounted to 14,000,000 tan (1 tan equals 60 kilograms) an amount which is equivalent to 12 per cent of the world's total production, and next to the United States and India in rank. The three provinces of Hopei, Shantung and Shanhsi are the main producing centres of North China whose average annual production is about 3,770,000 tan or 36 per cent of China's total. The area of land under cultivation and the cotton production of these three provinces for the past five years ending in 1936 are given in the table below.

CHINA'S COTTON CULTIVATION AND NORTH CHINA'S POSITION

	Land Under Cultivation (1,000 mu)			Cotton Production (1,000 tan)		
Year	China	3 Provinces of North China	Percentage of North China	China	3 Provinces of North China	Percentage of North China
1932	37,099	12,288	33.1%	8,160	3,206	38.3%
1933	40,454	12,790	31.6%	9,774	3,416	34.9%
1934	44,971	15,096	33.6%	11,203	4,771	42.6%
1935	35,026	9,185	26.2%	8,143	2,826	34.7%
1936	55,041	17,685	32.1%	14,430	4,750	32.9%
Average for five year	42,518	13,409	31.2%	10,331	3,774	36.5%

1 mu is equivalent to 1,000 square metres.

Statistics from S. M. R. North China Office, Hokushi Bosekigyo Kiso Shiryo (Source Book on the Spinning Industry in North China), 1938.

The question of increasing cotton production in North China has long been a matter of deep concern on the part of the proper authorities. Deliberations on the question have been going on for some time between the Provisional Government of Peking and the Japanese both of whom are represented in the Japan-China Economic Council, but of late cotton has been recognized "as a profitable agricultural product for native farmers and an important raw material for Japan." In line with this conclusion a policy for increasing production was adopted, execution of which will begin with the present year. The main points embodied in this plan are as follows:

1. In North China a plan calling for increasing cotton production to 10,000,000 tan per annum at the end of a period of 9 years beginning with 1938 will be carried out.

2. The area of land allotted for cotton cultivation will be increased to 30,000,000 mu. Much care will be taken to prevent the decrease which might occur in the cultivation of wheat and other grains in enlarging the area for cotton cultivation.

3. King's Improved and Tries will be selected for encouragement together with superior native varieties.

Parts of the plan to be carried out each year are given in the table below.

PROJECTED COTTON PRODUCTION FOR EACH YEAR

(In 1,000 tan)

	American Variety	Native Variety	Total
1938	2,246	1,958	4,204
1939	2,499	2,154	4,653
1940	2,803	2,369	5,171
1941	3,470	2,357	5,827
1942	4,199	2,343	6,542
1943	5,070	2,327	7,397
1944	5,972	2,310	8,282
1945	6,837	2,359	9,196
1946	7,665	2,335	10,000

The following are the points which will be carried out in the fulfillment of the policy.

1. To increase and encourage the cultivation of superior varieties.

2. To advance loans for the establish-

Digitized by Google

ment of irrigation facilities.

3. Establishment of publicity and encouragement organs.

4. Strengthening of the supervisory system.

5. Improvement of farming methods and the eradication of pests and plant diseases.

6. Readjustment of land leases for small tenant farming, improvement of transportation facilities, rationalization of transportation rates, readjustment of the customs, encouragement of immigration, and the encouragement for increasing the production of foodstuffs.

The total estimated expenditure needed to carry out the Nine-Year Plan is approximately 29,128,000 yuan, while the establishment of irrigation facilities will require an additional 72,362,000 yuan which will bring the total well up to the 100,000,000 yuan mark.

Upon realization of the Plan cotton production subsequently boosted to 10,000,000 tan per annum, this amount will be apportioned as follows:

3,500,000 tan to be consumed by the spinning industry of North China which will have by then a total of 1,300,000 spindles.

Other local consumption—1,00,000 tan.

Upon the revival of the spinning industry, Central China is expected to demand 2,500,000 tan, leaving 3,000,000 tan available for exporting to Japan.

Encouragement and Experimental Facilities. With the unrestricted support of the Japanese authorities, the Provisional Government of Peking is working assiduously to complete its organization for the encouragement of the cotton industry, and other organs connected with the cotton policy. The various organizations are outlined briefly below.

1. North China Cotton Industry Association. The membership of this organization is composed of prominent Hopei, Shantung and Shanhsi men in the cotton industry and reorganized groups of provincial cotton encouragement organs, and has its headquarters in Peking. For some time in the past the Provisional Government has given assistance in the promotion of enterprises, financing and supervision in Shantung, Hopei and Shanhsi Provinces. This organization is semi-official in nature and is a juridical person of the Chinese Republic. Its capital is subscribed jointly by the Government and by the Japan-China Spinners' Association. It has invited Japanese experts to supervise cultivation, improve quality and to increase output. Through the Rural Agricultural Associations it distributes seeds of improved varieties, supervises cultivation and makes advances to those in need of funds.

2. North China Company. This organization was formed at Tientsin last spring as a cotton purchasing firm under the joint auspices of the Japan-China Spinners' Association and the Cotton Industry Association. At present it owns three press factories and engages in the distribution of seeds and the financing of rural cotton raising communities, but since its small capital of 3,000,000 yuan tends to limit its sphere of activities preparations to increase it to 60,000,000 yuan are now under way.

Agricultural Experiment Stations in North China. The experiment stations dealing with cotton and other agricultural products that have existed from pre-China Incident days are listed in the following paragraphs.

1. Tsung-hsien Cotton Experiment Station. This experiment station is located to the east of Peking and was founded by Yin Tung, chief of the former Pei-Ning Railway Bureau, who with the assistance of the Japanese (especially Dr. Yoshida) created the experiment station under the management of the Railway in 1934. The services of a Manchurian expert (Mr. Iwasaki) was acquired from the S.M.R. which has operated a long string of experiment and encouragement institutions. This expert selected the most suitable site for the purpose and with the completion of the buildings, the station was ready for real work in 1935.

Since the foundation of the station up to the outbreak of the China Incident a total of 6 Japanese instructors and experts have been dispatched but two out of this group gave their lives to their cause, the weather conditions being disagreeable. Thanks to the untiring services of the other 4 pioneers of peaceful industrial development and to the generous efforts of Chinese assistants good progress was made, but unfortunately a brutal fate had to befall upon all of them in the form of bloody Tsungchow massacre carried out by the Chinese soldiers. The loss of these men is a grievous matter for the Chinese themselves.

Since then more earnest assistance has been given by Japan and 14 Japanese experts (S.M.R. men) detailed to the station in November, 1937, have carried on the work, while buildings and lands have been readjusted and a new entomology section created. Twenty-

Silk Textile Industry

Silk Weaving Districts As early as the days of the Emperor Suinin, about 1,960 years ago, weaving was already carried on, on a fairly large scale, under encouragement of the Imperial Court. During the Yedo Age the weaving industry made marked development as one of the most important domestic industries. The Ryomo district, which is one of the chief weaving districts for silk textiles for domestic use, has been known as a very prosperous weaving centre for centuries. This district is in Gumma and Tochigi prefectures and includes great weaving centres such as Ashikaga, Kiryu, Isézaki, Sano and Tatebayashi. The district may be likened to Paterson, New Jersey, U.S.A.

Another important weaving district is Fukui, followed by Kyoto, Ishikawa, Niigata and Tokyo in the order named. Among silk weaves of Japanese manufacture habutaé, taffeta, popline, chiffon, pongee, fuji silk, crêpe, etc, are well-known abroad. In addition to these, however, there are many varieties, which are used by the Japanese at home, but these weaves are generally of narrow width, omeshi, ro, sha, meisen, nishijin, etc.

The Industry in 1937 Continued prosperity featured the silk weaving industry in Japan in 1937, but exports decreased to ¥49,352,000 from ¥72,286,000 of 1936, largely owing to the state control of trade and the barriers set up by various foreign markets.

The number of mills was 65,552, a decrease of 7,047 as compared with the previous year, but that of looms increased by 9,895, indicating the increase of larger mills. The number of operatives also decreased by 16,067.

Production of Silk Weaves Owing to the increase in consumption at home production showed gains. Total production in 1937 was valued at ¥721,447,826, a gain of ¥58,314,297 or 8.7 per cent over the previous year. Of the total, crêpes amounted to ¥109,141,110 and showed an increase of ¥17,166,588 over 1936; habutaé totalled ¥29,319,154, a decrease of ¥2,678,964; and fuji silk ¥22,764,177 with a slight gain. Production of silk textiles since 1930 follows:

PRODUCTION OF SILK TEXTILES

(Compiled by the Ministry of Commerce and Industry)

Broad Weaves

Year	1930	1931	1932	1933	1934	1935	1936	1937

one Chinese who are cooperating heartily in the work have been added to the staff.

Today this station is carrying on experiments to produce high grade seeds and to improve cultivation methods, while fertilizers and irrigation matters are also receiving due attention. In addition wheat, kenaff and other grains are being studied, and the eradication as well as the prevention of insect pests are occupying much of the experimenters' time. The benefits which the general farmers of North China will shortly receive from the enthusiastic work of the station will be great indeed.

2. Peking Municipal Agricultural Experiment Station. 64 chobu of land (1 chobu is equal to 2.45 acres or 99.17 ares). Director—Mayor of Peking. 6 sections.

3. First Provincial Agricultural Experiment Station of Hopei at Tientsin. Yearly expenditure—4,000 to 6,000 yuan. 10 persons on staff.

4. Hantan Second Station—yearly expenditure—4,000 to 5,000 yuan. Personnel—8.

5. Tsohochen Third Station—Personnel —8. Yearly expenditure—4,000 to 5,000 yuan.

6. Titan Fourth Station—Annual expenditure—3,000 yuan. Personnel—6.

7. Lifen Cotton Experiment Station. Unknown.

8. Linching Cotton Experiment Station. Unknown.

9. Chengting National Cotton Experiment Station. Unknown.

10. Tsitung National Cotton Experiment Station. Unknown.

11. Tsinan Agricultural Experiment Station. Unknown.

12. Ting-hsien Experiment Station for Public Enlightenment.

With the outbreak of hostilities, the responsible persons of these experiment stations fled into safer regions carrying with them all valuable material and documents. Then came the anti-Japanese elements who utilized these stations for military purposes and left only the wrecks as reminders of what had existed before. No information regarding these stations was available under such conditions but with the coming of the Japanese anything that can still be used are being put in order. Before long the former stations will be in working order again.

Silk Textile Industry

Silk Weaving Districts As early as the days of the Emperor Suinin, about 1,960 years ago, weaving was already carried on, on a fairly large scale, under encouragement of the Imperial Court. During the Yedo Age the weaving industry made marked development as one of the most important domestic industries. The Ryomo district, which is one of the chief weaving districts for silk textiles for domestic use, has been known as a very prosperous weaving centre for centuries. This district is in Gumma and Tochigi prefectures and includes great weaving centres such as Ashikaga, Kiryu, Isézaki, Sano and Tatebayashi. The district may be likened to Paterson, New Jersey, U.S.A.

Another important weaving district is Fukui, followed by Kyoto, Ishikawa, Niigata and Tokyo in the order named. Among silk weaves of Japanese manufacture habutaé, taffeta, popline, chiffon, pongee, fuji silk, crêpe, etc, are well-known abroad. In addition to these, however, there are many varieties, which are used by the Japanese at home, but these weaves are generally of narrow width, omeshi, ro, sha, meisen, nishijin, etc.

The Industry in 1937 Continued prosperity featured the silk weaving industry in Japan in 1937, but exports decreased to ¥49,352,000 from ¥72,286,000 of 1936, largely owing to the state control of trade and the barriers set up by various foreign markets.

The number of mills was 65,552, a decrease of 7,047 as compared with the previous year, but that of looms increased by 9,895, indicating the increase of larger mills. The number of operatives also decreased by 16,067.

Production of Silk Weaves Owing to the increase in consumption at home production showed gains. Total production in 1937 was valued at ¥721,447,826, a gain of ¥58,314,297 or 8.7 per cent over the previous year. Of the total, crêpes amounted to ¥109,141,110 and showed an increase of ¥17,166,588 over 1936; habutaé totalled ¥29,319,154, a decrease of ¥2,678,964; and fuji silk ¥22,764,177 with a slight gain. Production of silk textiles since 1930 follows:

Rayon and Staple Fibre

Rayon and Staple Fibre Industry

According to an authentic estimate, the world production of rayon and staple fibre in 1937 reached 1,725,000,000 lbs., showing an increase of 300,000,000 lbs. over the previous year. Of the total amount of the world's output of these two commodities Japan produced 504,000,000 lbs. including 330,000,000 lbs. of rayon and 174,000,000 lbs. of staple fibre. It represents 29 per cent of the world production, putting Japan at the head of the rayon producing countries. The rate of increase in Japan's rayon exports was hampered by the adverse measures adopted by various countries and the occurrence of the China Affiar. Yet the total amount of exports of rayon yarn, tissues and other rayon products reached ¥235,000,000, placing rayon next only to cotton textiles and raw silk in Japan's export trade. Efforts were made, in 1937, for the improvement of the quality of rayon and for making up the decrease in exports of rayon tissues by an increase in exports of rayon yarns. In the second half of 1937 various difficulties cropped up in the relation between demand and supply on account of various adverse conditions, causing an unprecedented curtailment of operation in mills to the extent of 59 per cent toward the end of the year. The business results of rayon companies had been very encouraging through the second half of 1936 and the first half of 1937.

The control measures employed by the Government in 1937 on importation of goods, foreign exchange and distribution of capital in the country rendered it difficult for the rayon industry to make a headway, especially because of the dependence of this country on foreign pulp. However, Government regulation requiring the mixing of staple fibre with cotton and wool provided an impetus for the expansion of staple fibre industry, and the number of the companies concerned which received permission for collecting payment on shares and for raising funds for expanding the industry reached 36 and the aggregate expansion in funds amounted to ¥160,000,000 by the end of 1937.

With the progress of wartime measures in the country a thorough coordination of all companies and associations of spinning, weaving and dyeing industries was insisted upon and control measures were strengthened. By the establishment of the so-called planned economy which has required the curtailment of cotton and wool imports, it is intended to readjust international payments and to encourage the domestic production of pulp required for the staple fibre industry so as to make Japan self-sufficient with regard to the material within a five-year period according to a programme drawn out for the purpose.

Rayon Yarn

On account of economic and trade control the production and exports of rayon yarn in 1938 dwindled to a considerable extent as it is shown in the following table:

SUPPLY AND DEMAND OF RAYON YARN

(In cases. One case=100 pounds)

Year	Production	Imports	Exports	Exported as textiles	Domestic Consumption
1934	1,584,951	664	222,241	571,541	791,833
1935	2,230,215	433	304,279	701,273	1,225,096

Staple Fibre

Staple fibre became the most favoured among the industrial products of the country on account of its usefulness as a substitute for cotton and wool. The Government is encouraging its production by issuing laws and regulations, making it exempt from consumption tax and requiring its mixture with cotton and woollen yarns. Accordingly, the production of staple fibre in 1937 increased remarkably. It amounted to 175,000,000 lbs., three-and-half times as much as that of 1936 which had amounted to 45,850,000 lbs. Japan is next to Germany in the staple fibre production being responsible for 28 per cent of the world production. The figures for 1938 rose to 376,208,000 lbs.

PRODUCTION OF STAPLE FIBRE

(Compiled by the Japan Staple Fibre Manufacturers' Association)

Year	Production in 1,000 lbs.
1933	965
1934	4,720
1935	13,625
1936	45,850
1937	174,494
1938	376,208

The capacity of this country for the production of staple fibre has greatly increased during the years 1937 and 1938, on account of the expansion plans adopted by the staple fibre manufacturing companies and the turning of rayon manufacturing companies to this field. The aggregate productive capacity of the staple fibre companies at the end of May, 1937 was estimated at 215 tons per day while the actual production was 190 tons. At the end of 1937 the aggregate productive power of 9 staple fibre companies, 5 cotton spinning companies and 15 rayon manufacturing companies amounted to 600 tons per day and it was expected to increase to 970 tons by the end of 1938. To meet the present demand a daily production of 310 to 360 tons will suffice, estimating the daily demand of staple fibre for the purpose of mixing with cotton at 160 to 190 tons, with wool at 20 to 40 tons and for other purposes at 130 to 140 tons. The completion of the plans for expansion will depend on a large enough increase in demand during 1938 and after.

According to the report of the Japan Staple Fibre Manufacturers' Association the total exports of staple fibre and its products in 1938 amounted to ¥44,861,500, the figure representing twice as much as 1937.

EXPORTS OF STAPLE FIBRE AND ITS PRODUCTS IN 1937 AND 1938

Kind	1937	1938
Fibre in 1,000 lbs.	14,770	291
Value in ¥1,000	7,967.4	7,408.3
Yarn in 1,000 lbs.	8,177	10,598
Value in ¥1,000	7,408.3	10,673.2
Textiles in 1,000 sq. yards	16,754.6	60,452.5
Value in ¥1,000	6,871.9	26,780.0
Total value	22,247.6	44,861.5

Supply of Pulp

Japan's demand for pulp for the manufacture of rayon and staple fibre increased with the expansion of these industries in recent years. Total supply of pulp for making paper, rayon, staple fibre and cellophane reached 1,498,463 metric tons in 1937, including production in Japan and Manchoukuo and imports from other foreign countries. Of the total, 347,892 tons were for rayon, staple fibre and cellophane. The amount consumed for making these rayon and staple fibre was 279,155 tons, or 18 per cent of the total supply. As indicated in the following table the chief sources of supply are the U. S. A., Norway, Sweden and Finland. From the United States were bought 47 per cent of the total pulp imports.

SUPPLY AND DEMAND OF WOOD PULP FOR RAYON

Five-Year Plan for Self-Supply The expansion of staple fibre industry presents an acute problem on account of this country's dependence on imports of pulp. The national policy aimed at the readjustment of international payments by controlling imports is confronted with the paradoxical situation in which cotton and wool imports are curtailed but pulp imports are allowed to increase, because of the need for mixing staple fibre with cotton and wool. In order to solve the problem a special committee within the Domestic Production Promotion Commission was formed which drew out a five-year plan for the expansion of pulp manufacturing industry to be worked out in the combined area of Japan proper, Chosen and Manchoukuo. The plan was revised by the Board of Planning and adopted by the Cabinet at the end of 1937. According to this plan, the present pulp productive power of Japan which is estimated at 871,000 tons is to be increased to 1,650,000 tons within a period of 5 years to meet the expected rise in demand in 1942, which is estimated at 1,650,000 tons, of which 1,150,000 tons will be absorbed for paper manufacture, and 500,000 tons for rayon and staple fibre. The plan calls for the enlargement of existing factories and the establishment of new ones in Japan, Chosen and Manchoukuo.

Woollen Industry

Woollen Industry in 1938

The production of woollen yarns and textiles during the year was considerably curtailed on account of the large stock left over from the previous year and the Governmental limitation on imports of wool.

SUPPLY AND DEMAND OF WOOLLEN YARN

(In 1,000 pounds)

	Production by Associated Co's.	Imports	Total	Exports	Balance

CHAPTER XIX

MACHINERY AND ENGINEERING

Machinery

Introduction

The manufacture of machinery in Japan started after the Restoration. The progress at first was very slow, and it was only after the Russo-Japanese War of 1904-1905 that the public began to take any real interest in investment in this kind of industry. Improvement was gradually being made before the Great War, but with the outbreak of war the situation completely changed. Prior to the War Japan had to import large quantities of machinery, but during the War imports were stopped, and a great stimulus was thereby given to home production. During the war years Japan became able to supply not only most of her own needs, but also some of those of foreign countries. Factories for manufacturing arms and various kinds of machinery, as well as shipbuilding-yards, were established in many parts of the country, and these profited both financially and in the experience they acquired in skilled mechanical work of various kinds. The great boom in shipbuilding stimulated the establishment of many new works for turning out engines and other equipment for steamers, while the difficulty of obtaining imported machines for spinning, weaving, papermaking, etc., caused a rapid establishment of new works for their manufacture. This cutting off of imports also served to encourage the manufacture of motors, electrical machinery, automobiles and aeroplanes. With the great post-war slump, naval disarmament, general depression the world over, embargo on gold, high tariffs, and all the other ills from which industry suffered the machinery production industry was heavily hit. The outbreak of trouble in Manchuria in September, 1931, and the military operations which followed, created a new demand for arms, while the reimposition of the gold embargo, and subsequent decline of the value of the yen served to revive the industry.

Machinery Manufacturing Industry in 1938

The machinery manufacturing industry in this country has been very active since it was decided to perfect national defence. The advance achieved by the industry during 1937 and 1938 was quite remarkable, all the companies concerned recording an improvement in their business conditions without exception, under the influence of the enormous spending envisaged from the budget, and the Governmental encouragement for the expansion of the productive power of the companies.

Particularly were the leading companies affected because they were required to expand their producitve equipments, and many companies increased their capitalization.

Increase in Deliveries Ever since the quasi-emergency began, and by the occurrence of the China Affair in 1937, the production of machinery has shown an increase every successive business term. The big six machinery manufacturing companies, the Mitsubishi Heavy Industry, the Hitachi Seisakusho, the Kokusan Kogyo, the Shibaura Seisakusho, the Niigata Iron Works, the Ishikawajima Works and the Daido Denki Seiko manufactured various sorts of machinery to a total value of ¥585,516,000 during 1938 against ¥339,002,000 for the preceding year. Their total annual production during the past six years was :

1932	¥75,310,000
1933	98,140,000
1934	163,907,000
1935	247,819,000
1936	288,707,000
1937	339,002,000
1938	585,616,000

The increase in production has been especially remarkable since 1934. When considered in terms of index numbers, the increase was from 100 in 1932 to 777 in 1938. The following table shows the production by each of the big six:

Digitized by Google

	1937	1938		
	Total	First Half	Second Half	Total
		(unit: ¥1,000)		
Ishikawajima	23,988	15,352	16,845	32,197
Daido Seiko	9,254	8,580	12,864	21,444
Hitachi Seisakusho	104,412	116,446	137,521	253,967
Shibaura Seisakusho	41,383	22,684	28,106	50,790
Niigata Iron Works	25,380	9,488	10,807	20,295
Mitsubishi Heavy Industry	134,585	86,963	119,860	206,823
Total	339,002	259,513	326,003	585,516

Fixed assets of the six companies increased with production and reached ¥248,459,000 at the end of the second half of 1938 fiscal year, an increase of ¥185,796,000 or nearly 300 per cent as compared with the first half of 1932 in which it amounted to ¥62,663,000. It gained by ¥83,777,000 or 49 per cent as compared with the similar period of 1937. Details follow:

	2nd Half of 1937	1st Half of 1938	2nd Half of 1938
	(unit: ¥1,000)		
Isnikawajima	6,287	8,680	11,414
Daido	8,336	11,273	15,165
Hitachi	56,381	66,381	78,926
Shibaura	18,907	22,055	24,738
Niigata	5,208	6,465	7,127
Mitsubishi	69,563	87,590	111,089
Total	164,682	202,444	248,459

The expansion of floating assets was wider ranged, and the aggregate floating assets of the six companies reached ¥722,207,000 at the end of the second half of 1938 fiscal year, or 7 times as large as the amount in the first half of 1932. It gained by ¥382,315,000 or 112 per cent over 1937, as it is shown in the following table:

	2nd Half of 1937	1st Half of 1938	2nd Half of 1938
	(unit: ¥1,000)		
Ishikawajima	17,724	22,048	23,353
Daido	13,800	20,573	26,172
Hitachi	121,272	150,832	190,369
Shibaura	55,030	70,225	81,021
Niigata	8,978	11,968	16,473
Mitsubishi	123,088	319,518	384,819
Total	339,892	595,164	722,207

Other 15 representative machine manufacturing companies also increased their assets by ¥53,608,000 or 30 per cent in fixed assets and ¥157,890,000 or 42 per cent in floating assets. Details follow:

	2nd Half of 1937		2nd Half of 1938	
	Fixed Assets	Floating Assets	Fixed Assets	Floating Assets
	(unit: ¥1,000)			
Tsurumi Iron and Shipbuilding	35,803	35,113	37,141	44,375
Kawasaki Shipbuilding	49,930	121,390	50,380	114,822
Uraga Dockyard	8,527	23,401	5,297	27,624
Mitsubishi Electric Machinery	16,015	50,172	19,189	72,831

Tokyo Electric	14,958	30,550	19,058	36,265
Total	173,742	372,400	227,350	530,290

Figures for the total production of machinery and tools are as yet unavailable, especially details of the branches of the industry which are directly re-

Digitized by Google

lated to armaments are kept in secrecy. But, it is estimated to have reached as much as ¥3,735,000,000 against ¥2,557,201,000 for the previous year.

GROWTH OF MACHINERY INDUSTRY

Year	No. of mills	No. of operatives	Value of production (unit: ¥1,000)
1929	8,314	190,154	682,162
1930	8,458	205,308	615,682
1931	8,513	—	443,340
1932	9,388	230,896	543,842
1933	10,648	249,323	888,195
1934	12,103	314,669	1,159,167
1935	13,659	367,263	1,462,539
1936	15,052	456,963	1,716,352
1937	18,609	601,684	2,557,201

Note: The number of mills is revised. In addition to the above there were 386 governmental factories with 18,787 operatives and 75 public factories with 5,277 operatives in 1937. Figures for the total value of probuction in 1937 do not include the value of automobiles and motor cycles.

Note: In all the tables given above the value does not necessarily correspond with the number of production, because it includes value for production the number of which is not clearly reported.

Aircraft

Introduction Captain Tokugawa was the first pilot to fly a heavier than air machine in Japan. This was in 1910. The manufacture of aircraft was commenced in the Army and Navy arsenals and manufacture under licence was farmed out to private companies, in this way the manufacture of aeroplanes was greatly encouraged and military and naval aircraft can now be satisfactorily manufactured at home.

History Dr. Ichita Kishi, a physician, constructed at his own expense various workshops in his own residence at Tsukiji, Tokyo, and, in 1914, with the help of several expert engineers, succeeded in constructing an aeroplane engine, the first to be maufactured in this country. A trial flight of the aeroplane using this engine was very succesful, so he manufactured his second aeroplane in 1916. In 1917, Mr. Nakajima, a retired engineer captain of the Navy, manufactured various kinds of aeroplanes with the help of Messrs. Mohei Ishikawa and Seibei Kawanishi. In

Digitized by Google

1920, the **Aichi Tokei Denki Kaisha**, Ltd. (Aichi Clock Electric Machinery Co., Ltd.) established an aeroplane department and in the same year turned out a seaplane. From that time this department has developed rapidly. In 1921, the Kawanishi Machine Company established an aeroplane factory in Hyogo, and started the manufacture of seaplanes in 1923. Also, in 1921, the Mitsubishi Aircraft Co., Ltd., brought nine experts in aeroplane manufacturing from Great Britain and began to manufacture both aeroplanes and engines on a large scale. The Kawasaki Shipbuilding Co., Ltd., following in the steps of the Mitsubishi Aircraft Co., Ltd., began manufacturing aeroplanes in 1922.

Present State of the Industry The aircraft manufacturing industry has shown considerable activity in recent years. Aside from military requirements, manufactures have received good orders from public bodies who have raised subscriptions to denote aeroplanes to the army and navy. Japanese manufactured civil planes have had many successes of late and orders have been coming in for these. Manufacturers of aircrafts at present are as follows :

MANUFACTURERS OF AIRCRAFT

1936	9	2

Automobile Manufacturing

History The first automobile to be manufactured in Japan was by the Tokyo Motor Car Works, under the management of Mr. S. Yoshida, in the year 1909, but until the present progress has been very slow. In 1910, several military motor cars were manufactured for the Army in the Osaka Arsenal, and in 1911, the Tokyo Automobile Factory commenced the manufacture of "DAT" cars.

Note: Conditions of aircraft and automobile industries since 1936 are not made public.

The Tokyo Gas and Electric Co., Ltd., began to manufacture military automobiles "T.G.E." in 1916, and trucks in 1917. In 1918, the Military Automobile Subsidy Act was put into force and this company was the first to get a subsidy from the Army Department under the act. In 1920 the Tokyo Ishikawajima Shipbuilding Co., Ltd., began to manufacture passenger cars. Companies other than the above which are making automobiles are Hakuyosha, Ltd., and the Oriental Automobile Co.

Present State of the Industry The motor car industry is perhaps the only one of all the heavy induistries in Japan of which the country has not anything to feel proud of to-day. While there are more than 176,000 cars, buses and trucks of all kinds in the country, almost all of them are imported, about 80 per cent of them being Chevrolets and Fords. Of the balance, a considerable number are other American and European makes. However, inasmuch as the motor car industry is as yet undeveloped a great future can be prophesied for it.

Passenger Cars The "Atsuta-go", modelled after the Nash and White, and from this year, the "Nissan" are the only passenger cars manufactured in Japan aside from the baby cars.

Buses and Trucks Bus and truck manufacturing is slightly better than passenger car making. The "Chiyoda" manufactured by the Tokyo Gas and Electric Co., and the "Sumida" made by the Jidosha Kogyo Kaisha have long histories. These companies are also jointly making the "Isuzu," designed by the Department of Commerce and Industry. These three classes of buses and trucks are supplied to the market in considerable numbers. Kyodo Kokusai Jidosha, which was established in 1933 by these two companies, is selling domestic trucks and buses of five classes. The Mitsubishi Heavy Industry Co., Ltd. is making the large-sized bus "Fuso-go" at its Kobé plant, the Kawasaki Sharyo Kaisha, Ltd. the truck and bus "Rokko".

Baby Cars and Motor Cycles Small motor cars are defined, in dimensions and power, by the "Regulations of Motor Cars" and include such small-sized cars as the "Dutsun" car, rear cars, etc. Rear cars have made a marvellous development in Japan as a means of carrying small parcels. Their production totals 15,000 a year, for they are not only in use throughout Japan but are exported to Manchoukuo, the

Digitized by Google

South Sea Islands, etc. The sales of small-sized cars like the "Datsun", are rapidly increasing.

Accessories and Parts Associations and parts of motor cars used in Japan were almost exclusively of American make before replacement of the embargo on gold in 1931. Owing to the low exchange rate which followed thereafter their importation became very difficult and domestic makes took their place. At present, even Chevrolet and Ford parts are being replaced by demestic makes. They are also being exported.

PRODUCTION OF AUTOMABILES AND MOTOR CYCLES

(Value in yen)

Year	Imported Parts Assembled		Others		Accessories and Parts	Total	Motor Cycles	
	No.	Value	No.	Value	Value	Value	No.	Value

Imports of Automobiles In 1914 imports barely amounted to ¥500,000, but by 1929, they amounted to ¥30,000,000. Owing to the depression there was a drop to ¥20,000,000 in 1930, and to ¥14,000,000 in 1933. The figures then took an upward course, rising to ¥32,302,000 in 1934, ¥32,589,000 in 1935, ¥37,036,000 in 1936, and ¥30,682,000 in the first half of 1937.

Note: Datails of conditions of the industry and the trade in automobiles are not published.

Bicycle Manufacturing

History A bicycle was first introduced into Japan in 1881 by an Englishman. In 1889, an American brought a bicycle with him from America. In 1904, frames and other accessories were imported from Great Britain, and the making of bicycles at a lower cost became comparatively easy and bicycles became very popular.

Before 1913, accessories other than saddles, rims, and chains were being manufactured at home. Factories capable of manufacturing these latter articles on a large scale did not exist and it was impossible for small scale producers to compete against foreign

Digitized by Google

products. From 1913 on, however, the demand for bicycles increased at great speed, and as the manufacturing of each of the above parts on a large scale became possible, bicycles came to be produced at a very low cost, though until the World War, those manufactured in Japan could not compete with European-made ones. During the War, the art of manufacturing advanced so much that domestic bicycles could well compete in both quality and price with imported ones, and not only were home demands satisfied, but the Japanese product was exported to China, Russia, India and other countries.

Conditions Suitable for Bicycles Conditions in this country are well suited to the use of this vehicle. The factors which have made for the increased demand are :

(1) Individual wealth is comparatively small and the use of automobiles has not yet become universal.

(2) Roads are mostly too narrow, though greatly improved of late, to take automobiles.

(3) The making of bicycles, especially accessories like rims, is purely artisans' work, and is a type of work in which the Japanese people excel.

PRODUCTION OF BICYCLES IN JAPAN

(Value in yen)

Year	No. Produced	Value	Value of Accessories Produced
1929	90,285	2,593,051	16,138,063
1930	136,985	2,790,331	12,206,374

1938	—	13,650,000

Note:—Tyres are not included.

Shipbuilding

Introduction

The mercantile shipbuilding industry in Japan developed with the shipping business, while the development of warship building was mainly due to the urgent demands created by the Sino-Japanese and the Russo-Japanese Wars.

Owing to the construction of new vessels to be placed on subsidized lines, easy money and low interest rates, the shipbuilding industry which had been depressed since the close of the World War, revived and boomed temporarily in 1928. Tonnage output, which in 1919 amounted to as much as 674,000 tons, dropped to 53,000 tons in 1926. This was increased to 112,583 tons in 1928 and to 167,365 tons in 1929. However, as the improvement was brought about artificiallyl and not by general improvements in economic conditions, the industry soon became dull again, and was further depressed by the enforcement of the conditions of the London Disarmament Agreement. Naval orders to private shipbuilding companies were reduced by 30%, which, together with the decreased orders from private transportation companies reduced the 1931 output to 84,004 tons and in 1932 to 58,763 tons.

Owing, however, to the subsidies granted by the Department of Communications since 1932 for the improvement of steamers, the shipbuilding industry has been fairly active. The subsidies were granted with an aim of constructing 200,000 tons of new steamers, and closed at the end of March, 1935. In addition to this, due to the low exchange rate, enquiries for steamers are forthcoming from Brazil, Siam, Italy, France, Sweden, Soviet Russia, Manchoukuo, China, etc. (See Chapter XXVI, Sea Transportation.)

Trade in Machinery

Imports of Machinery

Imports of machinery in 1938 totalled ¥313,358,000 against ¥242,235,000 for 1937. Imports of machinery by Japan, excluding automobiles and their accessories, from 1919 to 1928, were somewhere between ¥100,000,000 and ¥140,000,000. There was a sharp reduction in 1930, and in 1931 the bottom was reached, but since then there has been a yearly increase. (See Chapter XI.)

Note : Amounts of fire-arms, internal conbustion engines and metal or wood-working machines are not made public.

Exports of Machinery

In 1938 Japan witnessed the highest record in exports of machinery of her own making. The value of exports was ¥267,237,000. The future of Japan's machinery manufacturing depends upon the degree to which her exports expand, and especially upon the development of the market in Manchoukuo. The invasion of Japanese products into the Dutch East Indies, British India and other foreign markets is a matter of future prospect. The exportation of Japanese made spinning and weaving machines is very promising. The Toyoda Automatic Weaving Machines are very much in demand wherever the spinning industry prospers. Diesel-engines to be fitted into fishing vessels are built in Japan and shipped to the Dutch East Indies. Japanese made machines exported during the last 4 years follow :

CHAPTER XX

UTILITIES

Electricity

At the end of 1936 the number of concerns engaged in the electric business was 1,172, and the number of private electric plants in factories, etc. was 8,695. The total capacity of these 9,867 plants aggregated 6,777,422 kw., the hydro-electric 3,759,334 kw. and the thermal-electric 2,924,778 kw. Plants under construction were to have a further combined capacity of 2,067,860 kw.

Important items of electric industry are not made public since October, 1937.

1935	4,124,389,526	225,730,583	5.5
1936	4,296,016,000	289,414,000	6.8

According to the report of the Ministry of Commerce and Industry on the business conditions of 403 electric companies in 1937 the aggregate capital amounted to ¥3,149,087,285, reserve fund ¥204,320,669, net profit ¥195,560,074, dividend ¥171,874,648. According to the report of the Ministry of Communications the total number of electric companies, electric railway companies, self-supplying factories and governmental offices was 10,627 at the end of October, 1938, and the total amount of capital of electric companies and electric railway companies reached ¥5,631,266,861.

Electricity in 1936 and 1937

The progress of the electric light and power industry in Japan has been remarkable, especially in the last few years on account of the Governmental policy of expansion of heavy industries which has inevitably led to a corresponding increase in the supply of electric power. The consumption of electric power by the heavy and chemical industries has increased remarkably representing over 50 per cent of the total consumption of electric power for industrial purposes. According to the report of the Department of Communications the consumption of electric power by the various industries in 1932-36 was as follows:

CONSUMPTION OF ELECTRIC POWER BY INDUSTRIES

(Compiled by the Ministry of Communications)

(In 1,000 kw. h.)

	1932	1933	1934	1935	1936
Fibre Industry	1,103,153	1,254,846	1,424,818	1,689,579	1,802,421
Mining	976,184	1,157,110	1,296,205	1,440,458	1,686,288
Metal Industry	519,850	630,107	1,200,700	1,666,182	2,219,902
Machine and Tool Manufacturing	152,621	217,102	292,408	373,872	466,466
Chemical Industry	2,896,845	2,415,964	4,044,205	5,051,275	5,895,349
Ceramic Industry	459,504	537,380	587,993	745,254	822,819
Foodstuffs	60,166	71,244	74,819	99,171	122,051
Others	179,243	222,690	243,220	314,536	350,400
Total	6,347,566	7,506,443	9,264,568	11,380,327	13,265,696

Capacity of Power Plants in 1936 The total power generated by power plants in 1936 was 6,777,422 kw., 85 per cent of which was supplied for industrial purposes, and 15 per cent was consumed by the plants themselves. Hydro-electric power generated represented 55 per cent and thermal-electric power 45 per cent. The rate of increase in the past 10 years was

Digitized by Google

95 per cent in the total, 78 per cent in hydro-electric power, and 115 per cent in thermal-electric power.

CAPACITY OF POWER PLANTS IN JAPAN PROPER
(At the end of 1936)
(In kw.)

Description of Power Plants	Supplied to Others	For Self Consumption	Total
Total hydro electric	5,246,966	189,642	5,436,608
Completed	3,651,547	107,787	3,759,334
Under Construction	1,595,419	81,855	1,677,274
Total thermal-electric	2,441,211	865,742	3,306,953
Completed	2,125,036	799,742	2,924,778
Under Construction	316,175	66,000	382,175

Completed	17,389	75,921	93,310
Under Construction	87	8,324	8,411
Total	7,705,653	1,139,629	8,845,282
Completed	5,793,972	983,450	6,777,422
Under Construction	1,911,681	156,179	2,067,860

Electric Lights Electric lighting facilities were available in all the 11,500 towns and villages in Japan proper, except in 199 small villages located in the remotest districts and lone islets. The number of electric lamps installed by the end of 1936 was 44,405,699, an increase of 1,927,871 or 4.5 per cent over the previous year. This figures out at 63 lamps per 100 of population.

Electric Power Consumed in 1936 The demand for electricity, both for lighting and for power, grew steadily during the year, the volume utilized for the various industrial purposes in 1936 reaching 4,899,377 kw., an increase of 154 per cent in the past 10 years, and 49 per cent in the past 5 years.

ELECTRIC POWER CONSUMED IN 1936
BY KINDS OF INDUSTRY

	kw.	Percentage
Fibre and Textiles	647,477	13
Metal Works	876,988	17
Machine and Tool Mfg.	286,924	6
Ceramic Industry	335,292	7
Chemical Industry	1,033,190	22
Saw mills and Timber Works	170,825	3
Printing and Bookbinding	26,023	1
Foodstuffs	337,984	6
Miscellaneous	78,470	2
Mining	380,165	8
Agriculture and Fisheries	88,699	2
Others	637,337	13
Total	4,899,377	100

The total consumption of electric power in 1936 was 24,132,870,000 kw. h. According to the statistical year-book of the League of Nations, Japan occupies the third position among the important consumers of electric power in the world, surpassed only by the United States and Canada.

Business Results The total amount of the authorized capital of the electric power supply companies in Japan proper in 1936 reached ¥5,491,000,000 an increase of ¥288,000,000 over the previous year. Shares and loans amounted to ¥2,199,000,000, corresponding to 52 per cent of the paid-up capital and 37 per cent of the fixed assets. The profit amounted to ¥289,000,000 or 6.8 per cent on the paid-up capital. Of the 820 companies 4 per cent were able to pay over 10 per cent dividend, 35 per cent over 5 per cent dividend, the companies which paid dividends numbering 62 per cent.

Activities in China With the progress of the China Affair the electric power companies of Japan found new fields for their activities and are extending their operations to those parts of China where peace has been restored. The Japan Electric Power Suppliers' Association has established the North China Electric Development Company with an authorized capital amounting to ¥5,000,000 (one-fourth paid-up) for supplying electric power to the Tientsin district with the present capacity of 30,000 kw. The proposed plan for North China is to increase the capacity to 100,000 kw. with a capitalization of ¥50,000,000.

For the reorganization of electric power business in Central China the five largest electric power companies of Japan are going to form an association in accordance with the Governmental

Digitized by Google

plan to supply power to Shanghai and Nanking districts, and engineers have been sent to make a thorough investigation there.

State Control of Electric Power The problem of State control of electric power has been a subject of discussion for several years past among the persons directly concerned, and the project was put to a most careful examination, in view of the vastness of the sphere involved, before it was framed into a bill and passed by the 73rd Diet.

For several years past this project sponsored by the Government had met with vigorous opposition from experts and electric power companies both in and out of the Diet house and the project seemed to have arrived at a deadlock. In the meanwhile the situation at home and abroad had developed to such a stage that the Government found it necessary to strengthen its control on many industrial and commercial enterprises, and the power control was taken up once more as one of the most important measures for consolidating national life. The Konoé Cabinet commanded the implicit confidence of the whole nation and the country looked to it for the solution of many a pending problem. Communications Minister Ryutaro Nagai had been one of the ardent advocates of the State control of electric power for years and he immediately took up the problem and ordered the formation of the Extraordinary Commission for Enquiry into Electric Power Problem. On October 13, 1937, the Commission was organized under the presidency of the Minister of Communications with 33 members, including 4 Government officials, 3 members of the House of Peers, 8 members of the House of Representatives, 5 big electric power owners, 3 representative consumers, 5 bankers, and 5 electric experts. The Commission submitted its final recommendations on November 19, after the conclusion of its deliberations lasting for a month. The Government approved the report and framed on its basis the electric Power Control Bill and placed it before the Diet session on January 25, 1938. The bill was passed, on March 26, after heated debates between the two sides and with amendments on several important points, accompanied by revisions of existing laws relating to electric industry and commerce.

The purpose of the State control of electric power is stated in Article I of the newly enacted law as follows: Generation and transmission of electric power shall be controlled by the Government in order to supply more abundant volume of electric power and at cheaper prices so as to make it more easily available to the people. Article II states that the State control of electric power is to be carried out through a new semi-Governmental corporation.

The new concern is called Nippon Has-So Den Kabushiki Kaisha (Japan Electric Power Generating and Transmitting Joint Stock Company). The Company will have under its control (a) all the important new equipment to be installed for generating hydro-electric power as well as the existing equipment which cannot be dispensed with for rational utilization of water power resources, (b) important thermal power plants and (c) important equipment for power transmission.

The State power control will not be extended over water power resources already developed, inasmuch as the volume of water utilized for the purpose of generating power by the existing plants is more or less fixed and no measure of control is felt necessary other than that of transmission lines for the full utilization of these resources. But equipment such as that used for the purpose of generating a supplementary supply of power, and the hydraulic equipment already in operation which must be radically reconstructed in order to ensure better and more complete utilization of resources will come under State control.

All the new equipment coming within the scope of State control shall be operated by the new company, and plants which are already in operation shall be placed under the management or direction of the new company. The hydraulic electric power generated by the existing plants shall be sold to the new company, which will have the lines to transmit it to the distributors.

In carrying out the control measures, important matters relating to supply and demand, plans for the construction of the generating and transmitting equipment are to be decided on by the Government on the basis of the recommendations submitted by the Electric Power Council which is to be created with a membership including the most skilled technicians and experienced administrators, the execution of the plans and the actual operation of business being left to the new company. The new company will be given governmental assistance in rais-

Digitized by Google

ing funds and guaranteeing dividends, and will be awarded a reduction of or exemption from taxes and such other privileges necessary for business operation. The officers of the company are to be appointed by the Government; all additions to or alterations in the laws relating to the company, the issuance of debentures, the disposition of profits and other important matters are to be carried out with the approval of the Government, which will also issue orders relating to the business management of the company.

In enlarging the scope of power distribution, a rearrangement and coordination of areas shall be effected. Improvement of business conditions and a more extensive use of power all over the country are among the objects aimed at by the Government. For the purpose of lowering and equalizing the rate of distribution Governmental supervision shall be augmented.

A fair quantity of surplus power shall be kept in store at all times in preparation for emergencies and reserve equipment shall be porperly arranged. Power generated for private use will also be subjected to State control to a certain extent. With a view to ensuring the supply of power and meeting the immediate needs the measure for control of consumption will be carried out according to the requirements of the circumstances.

Proposed Plan of the Nippon Has-so Den Kabushiki Kaisha The proposed plan of the new semi-Governmental electric company revealed by the Government on February 7, 1938 at the special committee of enquiry on the power control bill of the House of Representatives is as follows:

1. The company shall be capitalized at ¥880,000,000, of which ¥780,000,000 shall be obtained through conversion of the fixed assets and rights of the existing companies and equipment and the new equipment to be installed in the first 2 years of the establishment of the company. The remaining ¥100,000,000 shall be raised from among the general public.

2. The construction plan of the company includes the establishment of the following plants over a period of ten years: Hydraulic generating plants with a capacity for 3,200,000 kw.; Thermal generating plants with a capacity for 4,500,000 kw.; Transmission lines 13,000 km.; Transformer stations for 10,400,000 k.v.a. The expenses for the construction of the new plants and stations will amount to ¥1,890,000,000 during the 10 years after the establishment of the company in accordance with the 10-year programme.

Business Plan When the 10-year programme is complete the company will be able to supply electric power to the quantity of 7,300,000 kw. or over 45,000,000,000 kw. h. The income will be ¥526,640,000; the expenditure ¥446,990,000; net profit 79,650,000; dividend ¥60,200,000 (at 7 per cent); and reserves ¥19,450,000.

The capacity of generating and transmitting power will be as stated in the construction plan mentioned above in addition to 3,500,000 kw. of purchased electric power. The fixed assets of the company will be ¥2,670,000,000.

Start of the New Company The special commission for the valuation of the fixed assets and rights of the existing companies came, on December 14, 1938, to the conclusion that the total amount of their value for 33 electric companies reached ¥653,100,000, and decided on the capital of the new company as ¥753,100,000, adding to the above, another ¥100,000,000 which is to be obtained by floatation of shares. Of the 33 companies those companies which were valued as surpassing ¥10,000,000 were as follows:

Tokyo Electric Light Co.	¥136,700,000
Daido Electric Power	102,300,000
Nippon Electric	100,600,000
Kwansai Kyodo Electric	57,800,000
Toho Electric Power	40,600,000
Ujigawa Electric Power	35,800,000
Sanyo Central Electric	18,000,009
Kyushu Electric	17,000,000
Hiroshima Electric Power	16,500,000
Showa Electric Power	15,800,000
Yamaguchi Prefectural Electric	15,600,000
Chugoku Godo Electric	12,600,000

On April 1, 1939, the members of the Board of Directors were appointed and the arrangements with other companies involving the taking-over of staffs and employees and the transfer of assets and equipment were completed. The important contract in respect of the taking-over of electric power amounting to 2,200,000 kilowatts from fifty-two companies and of the supply of 3,400,000 kilowatts of electric power to seventy companies has been executed smoothly.

The company enjoys no privilege in the way of exemption from taxes but debentures it issues have the guarantee of the Government, so that the company will have no difficulties in matters of finance.

Gas Industry

Introduction

When compared with the electric industry, the gas industry has been very slow in its development. The introduction of gas took place in 1885, when it was used in Yokohama for street lighting purposes. Later in the same year Tokyo adopted it for the same purpose. The capital invested in 1885 was ¥54,000, and a slow but steady increase took place until 1925, when the invested capital stood at ¥276,373,000. After that year the industry made great strides as the following figures show:

	Coal Consumed	Output	Amount Supplied to Consumers	No. of Consumers	No. of Lights and Burners	Byproducts		Gas Motors	
						Coke	Coaltar	Number	Horsepower
	Metric ton	Thousand cubic metres	Thousand cubic metres			(Unit: metric ton)	(Unit: 1,000 litres)		
1932	1,283,216	734,188	712,717	1,785,205	3,921,620	851,268	66,032	437	12,517
1933	1,402,000	770,447	709,967	1,866,369	4,145,549	933,596	73,252	476	13,947
1934	1,461,000	1,046,639	741,787	1,906,409	4,242,215	971,242	75,923	528	42,486
1935	1,522,000	1,219,746	771,534	1,995,000	4,453,919	1,012,443	83,865	529	41,777
1936	1,614,000	858,965	810,095	2,112,000	5,771,537	1,068,968	86,204	548	45,023
1937	2,243,000	—	859,424	2,233,000	6,173,970	1,134,220	90,162	653	42,977

BUSINESS RESULTS OF GAS COMPANIES

(In ¥1,000)

March	Paid-up Capital	Fixed Assets	Profit	Percentage of Profit against Fixed Capital	Dividend Rate
1932	395,632	571,564	51,452	8.7%	8.3%
1933	400,908	580,053	50,317	9.1	8.0
1934	419,096	584,323	53,029	9.1	7.8
1935	440,210	585,998	60,295	13.6	7.6
1936	458,196	591,637	70,302	11.9	7.8
1937	460,403	608,919	78,232	12.8	8.4
1938	326,654	402,211	54,035	13.4	8.4

Gas Industry in 1937

At the beginning of 1937 the gas companies in operation numbered 111, and those which were about to be launched out numbered 10. The former had increased by 3 while the latter had decreased by an equal number as compared with the previous year. The business conditions of these gas concerns were as follows:

BUSINESS CONDITIONS OF GAS INDUSTRY IN 1937

(In ¥1,000)

Producers	Authorized Capital	Paid-up Capital	Loans	Reserves	Working Expenditure
Six big municipalities	271,395	195,110	18,113	19,737	230,419
Other municipalities	62,368	38,152	6,696	4,246	44,687
Private companies	295,884	227,140	141,898	117,769	13,279
Total	629,647	460,402	176,707	222,752	288,385

The authorized capital increased by ¥8,257,000 and the paid-up capital by ¥2,207,000 over the previous year.

The volume of gas supplied in 1937 reached 810,095,000 cubic metres, an increase of 4.9 per cent over the previous year. The aggregate income amounted to ¥186,904,000 against ¥108,645,000 of disbursement, increasing ¥15,766,000 (9.2 per cent) and ¥7,966,000 (7.9 per cent)

Digitized by Google

respectively over the previous year. The average rate of dividend was 8.4 an increase of 0.6, and had a balance of ¥7,000,000 which was carried over to the first half of 1938. The reason for better business conditions in 1937 is to be found in the unprecedented activity of the heavy industries during the year, the prosperity of the gas industry being more noticeable in the larger cities.

The principal material being used for the production of gas is coal, but coke and oil are also used to a considerable extent. The use of the best kind of coal is indispensable both for gas production itself and for obtaining the best coke. The coal used by the gas producers in Japan proper is mined mostly in the Japanese islands. Coke used for various purposes in gas industry in a year is estimated at about 245,000 metric tons. The amount of coal consumed for the production of gas as well as coke in 1937 was estimated at 2,243,000 metric tons.

The by-products such as coke, coaltar, and chemicals, are numerous and are increasingly demanded by various other industries. The future of the gas industry, therefore, is bright and may undergo a considerable readjustment in scope and extent. But the revenue for the industry through supplying gas to private homes cannot be expected to increase because of the strict price-control effected by the Government in the interest of people's economy.

Warehousing

History

Since warehousing depends on the storing of large quantities of goods, transportation facilities are the factors which influence its success, an expansion of one calls for an expansion of the other and, in Japan, it was the development of transport facilities in the days of Meiji which gave rise to the modern warehousing business.

Warehouses of kinds have always existed. Emperors in olden times kept rice and cereals in warehouses for military purposes. Later, cereals were kept to provide for relief of the people in case of poor crops, but in either case, the warehouses were used for military or political, not commercial, purposes. When the Tokugawas came to rule the country as Shoguns about three hundred years ago, both Yedo (present Tokyo) and Osaka became great cities where trade and commerce flourished. Transportation by sea developed, and many feudal lords came to reside in these cities, bringing with them, or having sent to them, the agricultural products of their country districts. The produce was stored at the lords' residences, which became, in a sense, public warehouses. The produce was sold by public tender and to the successful bidder a memorandum was given against receipt of payment in cash. This memorandum was equivalent to the warehouse receipt of the present day, and the holder of the memorandum was authorized to keep his cereals in the warehouses for the time stipulated on it. Loans were often raised with memoranda as collaterals.

After the Restoration, owing to development of commerce and activity in the movement of goods, many warehouse businsses were started, the first company, to operate on a modern basis being the Soko Kaisha in Fukagawa, Tokyo, established in 1881 with a capital of ¥65,000. Dissolution took place 3 years later. In Osaka, the Konoiké family organized the Osaka Soko Kaisha with a capital of ¥200,000 in 1882. In 1883, the Sanbashi Kaisha in Kobé, and in 1884, the Otsu Soko Kaisha in Otsu in Shiga prefecture, were established. In 1886, the Tokyo Soko Kaisha, Ltd., was founded by the Iwasaki family. After that year there was no great change until after the Sino-Japanese War, when with increased foreign trade and improved transportation ficilities by land and sea, the number of warehouse companies rapidly increased. In 1906, there were 536 people engaged in the warehouse business, either on private account or on an incorporated basis.

Present State of the Business

At the end of 1938 the number of warehouses managed by the member companies of the Japan Warehouse Association was 188, the value of commodities stored, being, on the average throughout the year, ¥773,045,000. According to an investigation made by the Department of Commerce and Industry, the number of warehouse managements in the country totalled 462, capitalized with ¥178,805,734, and profit gained ¥5,046,841 in 1937.

Value of Commodities The quantity and value of commodities stored in the ware-houses were as follows:

CHAPTER XXI

FOODSTUFFS

(Manufactured)

Wheat Flour

Historical Survey

Before the Russo-Japanese War It was not until after the Russo-Japanese War (1904–5) that the wheat flour industry made any progress in Japan. Prior to the war there was a fairly large consumption, but manufacturing was only in the infant stage, most of the production being with the help of water-wheels. The daily output by this method was only 10 to 50 or 60 bags; the quality was poor and not uniform and, being packed in straw bags, the product was not at all satisfactory. It was only in the year 1895 that wheat flour was first produced on a modern basis by machinery. In that year, the Nippon Seifun Kaisha, Ltd., began to operate mills with a capacity of 200 koku per day, and gradually, mills with capacities of 50 to 100 koku a day were established, but progress was very slow. However, the demand for flour increased and as production could not keep pace with it imports naturally increased. In 1895, imports were 280,000 bags, valued at ¥400,000, ten years later imports had increased to 4,990,000 bags, valued at ¥9,950,000. Imported and water-mill produced domestic flour together satisfied practically the whole of home consumption, while domestic flour made by machinery formed but a very small part of the supply. The imported flour coming chiefly from the United States of America, was of a far superior quality to the home product.

Yield of Wheat Before 1901, the land used for wheat planting averaged between 440,000 and 480,000 cho, and in 1905, it was 450,000 cho. The yield of wheat gradually increased up to 1901, when it was 4,370,000 koku, but during the next few years there was a gradual decrease until in 1905 the yield was 3,600,000 koku.

As regards imported wheat, the amount imported usually depended upon the domestic wheat crops, but showed in general a gradual increase. In 1895 imports were only 1,600 koku with a value of ¥7,500. In 1902 they had increased to 38,000 koku, valued at ¥240,000. The year 1903 proved to be a lean year for domestic wheat, and imports suddenly increased to 560,000 koku, of a value of ¥4,760,000. After that, owing to the prosperity which visited Japan after the war with Russia, wheat continued to be imported in large quantities. In 1904 it was 170,000 koku, valued at ¥1,530,000, and in 1905, 450,000 koku, valued at ¥4,000,000.

After the Russo-Japanese War Many flour mills were established on a modern basis during the time of the great boom which followed the Russo-Japanese War, and production capacity was greatly expanded, but a contraction was brought about by the closing down of many of the newly established mills when the reaction later set in. In 1914, when the World War started the capacity of production by machinery was 9,060 barrels and this, by 1922, had increased to over 20,000 barrels. During those seven years the industry experienced unprecedented prosperity, and with this development on modern lines, domestic producers who make flour in the old-fashioned way have lost nearly all their customers and, further, imported flour has been practically shut out of the country.

The Industry at Present

Production and Imports of Wheat After 1918 the demand for wheat flour, keeping pace with the advance in the standard of living, greatly increased. The extended westernization of the country in recent years largely accounts for this and has brought about a consequent heavy demand for wheat. Home production has not increased to meet the demand, the result being, as the following tables show, heavy annual importations of wheat. An attempt, therefore, has been made by the Government to increase domestic production through tariff and increase of wheat acreage, in which they were highly successful. The production increased

Digitized by Google

very much in 1933 in proportion to the increased acreage, which was further accelerated in 1935, when an all-time record high was established. The production in 1936 decreased by 7.2 per cent as compared with the preceding year. But, 1937 production recorded highest in the history with 9,996,048 koku. In 1938, the wheat production was estimated at over 10 million koku, but on account of the damages by typhoon and the attack of insects and bacteria the actual crop was reduced to 8,900,000 koku.

PRODUCTION OF DOMESTIC WHEAT AND ITS ACREAGE

Flour Industry in 1938

The wheat flour industry which had been dull in the first half of 1937 was quickened into activity in the second half, and the monthly production in 1938 always kept the mark of over 3 million bags and the total for 1938 was 42,964,000 bags according to the investigation of the Nisshin Flour Company, (The Department of Commerce and Industry puts it as 41,971,000 bags). It is an increase of 4,679,000 bags or 12 per cent over the previous year.

The home consumption of wheat flour remained almost the same as that for the previous year, while the exports showed a great increase with the total volume of 4,758,869 piculs valued at ¥60,715,000 which represents an increase of 77 per cent in volume and 97 per cent in value over the previous year, mainly because of a greater demand in Manchoukuo and North and Central China where peace and order was restored. Manchoukuo bought 1,198,597 piculs as against 231,900 piculs for 1937. China who had bought only 17,133 piculs in 1934, bought as much as 1,880,771 piculs in 1938 setting the highest record in the recent years.

The price was high all through the year with the rise in price of wheat and Tokyo futures fluctuated between ¥4.73 and ¥5.10 per bag, making an average of ¥4.93 for the year, 3 sen cheaper as compared with the previous year.

Sugar

History and Development

The art of making sugar was introduced from China about two hundred years ago, but no great progress is recorded in sugar manufacture until after the Restoration, and even then it remained as a farmers' sideline until the end of the Sino-Japanese War of 1894-5, when Formosa, well-known for its sugar production, was ceded to Japan by China. This marked a new era in the sugar industry. In 1896, a sugar refining company was organized in Osaka and from that time the industry began to develop.

The Government undertook to levy a duty on raw sugar in 1899, and, by successive steps, this duty has reached the present rate. In 1911, a tariff of a similar nature was imposed, for the first time, on refined sugar.

In view of the fact that Formosa is ideal both in temperature and rainfall for cane growing the Government decided to encourage the establishment of sugar mills in the Island. With this in view it established the Temporary Sugar Bureau as a branch of the Government of Formosa. The Bureau subsidized sugar companies in establishing sugar mills and purchasing required machinery.. It imported cane seedlings and distributed them to cane growers. It gave, too, subsidies for the purchase of fertilizes, and in various other ways succeeded in dispensing as subsidies, up to 1924, a sum amounting to more than thirteen million yen. As the result of these subsidies, the industry has developed to the present stage. In 1902, the production of raw sugar in Formosa was only about 600,000 piculs, but by 1931 this had increased to over 13,000,000 piculs.

In 1901, the Taiwan Sugar Co., Ltd., was organized. Raw sugar mills with all new machines were established and war was declared against the old-fashioned machines which were only able to produce raw brown sugar. Development was destined to be slow, for the plantations and mills were subject to attacks from the native savages, but this difficulty was gradually overcome and during the prosperity that visited Japan after the Russo-Japanese War, many new companies were organized and the industry developed rapidly.

Present State of the Industry

The sugar industry in Shikoku, Kyushu, and the Loochoo Islands is making no headway, but that in Formosa and the South Sea Islands is rapidly progressing, and at present it is the Formosan sugar that controls the sugar market in Japan. Refining is making good progress in Japan proper.

Brewing

Beer

Historical Beer was brewed in Japan about 80 years ago by a certain scholar, Mr. Ko Kawamoto, who, as he learned how to brew it when he visited Admiral Perry's fleet, on the latter's visit to Japan, tried to brew on his own private account. In 1870, beer was brewed for the first time on a modern industrial basis by an American, Mr. Gobland, at Amanuma, Yokohama. Four years later, Marquis K. Kuroda saw that the soil of Hokkaido was particularly suitable for barley, so he established a brewery in Sapporo, and soon others were built in Meguro, Tokyo, in Suita, Osaka, in Hodogaya, Yokohama, and other places, and the industry has so developed that at present Japan has six beer brewery companies and fifteen breweries with a total capacity of about 2,000,000 koku.

At the end of Feburary	No. of Brewery	Production of Beer (In Koku)
1930	14	846,014
1931	14	797,544
1932	14	797,283
1933	14	959,762
1934	14	980,175
1935	14	1,047,213
1936	15	1,312,496
1937	15	1,275,055

Japan as Beer Consuming Country In spite of the increase in consumption, Japan still occupies an insignificant position as beer producer and consumer in the world. Her production of about 1,000,000 koku in 1933 stands at the fourteenth in the list of beer producing countries with the U. S. A.'s 27,000,000 koku as the first. Also her per capita consumption of 2.77 litres was the tweny-eighth in the list of beer consumers with Belgium's 176.46 litres at the head. This is easy to explain. Most of her people take saké, the production of which is about 4.5 times as large as beer. Saké is the standard drink, only a very small quantity of which is enough for average man. In other countries, beer is a staple, an article of food. But in Japan it is something of luxury, reserved for the people of middle and upper classes. A bottle of beer, which contains about one-fifth of a gallon of beer, sells about at 50 or 60 sen, which is too high for average Japanese farmers or wage-earners. If the Japanese of these classes take as much beer as the Belgians do they would spend greater portion of their income on beer.

Beer in 1938. The amount of beer production of four major companies in 1938 reached 1,476,000 koku, an increase of 215,000 koku or 17 per cent over the previous year.

Exports of Beer The exports of beer in 1938 amounted to 240,488 koku, an increase of 105,511 koku over the previous year. The exports to Manchoukuo increased by 4,739 koku. China bought more, and China bids to be an increasingly large market for Japanese beer. Japanese beer companies are planning for a vigorous extension of their trade in North China.

Japanese Saké

History Japanese saké, brewed from rice, has been the principal alcoholic liquor of the Japanese from olden times. It is brewed everywhere in the country, but the most famous places are the "Nada Gogo," five villages in Hyogo prefecture, the climatic conditions of which are peculiarly suited for its production. In recent years, Hiroshima and Fukuoka prefectures have also be-

Digitized by Google

gun to brew saké of superior grade. The best rice for saké brewing is raised in Kumamoto, Hyogo and Okayama prefectures.

As saké has been the chief drink of the people for many centuries it has been heavily taxed all along. In 1879, a tax of ¥2 per koku was levied and since then the rate has been gradually increased until it now amounts to ¥40 per koku and brings in an annual revenue to the Government of ¥200,000,000.

No study of brewing saké on a scientific basis was started until as late as 1895. In 1904, a Brewery Experimental Station was established by the Government, at Oji, Tokyo, various experiments were made, and many good experts trained. The art of brewing has now advanced a great deal and the quality of saké brewed has become practically uniform. The quantity now brewed annually is about 5,000,000 koku, nearly all of which is consumed at home, only a negligibly small quantity being exported to China and several other countries.

Present Condition Production of saké in recent years is as follows:

PRODUCTION OF SAKÉ BY KINDS

(In 1,000 koku)

Year (Oct.-Sept.)	No. of Brewery (Sept.)	Refined Saké	Unrefined Saké	White Saké	Sweet Saké	Distilled Saké	Total
1930-31	9,905	3,851	6	6	70	455	4,121
1931-32	9,570	3,284	5	6	87	445	3,829
1932-33	9,236	3,807	5	6	100	509	4,429
1933-34	8,971	4,012	6	6	92	528	4,646
1934-35	8,745	3,772	5	6	87	499	4,371
1935-36	8,580	3,784	5	6	97	534	4,426
1936-37	8,428	3,983	5	5	105	542	4,641

The peculiarity of brewing saké is that large quantities of raw materials cannot be fermented at once. According to the growth of saccharomyces saké, steamed rice, yeast, and water are gradually added and fermentation is brought about slowly. If this method is adopted, with only a very small quantity of saccharomyces saké a large amount of raw materials may be formented and saké of good flavour may be brewed. If, on the other hand, a large quantity of raw materials is fermented at one time by using a great deal of saccharomyces saké, the resultant saké will not taste good.

Consumption of Saké Nothing is more directly affected by prosperity or depression than the consumption of saké, and it can be quite well understood that consumption, owing to the economic depression, has considerably decreased during the last few years. The farming districts are now feeling the depression very severely, and as saké is consumed more in rural than in urban districts, the saké brewers have suffered in proportion.

Supply and Demand in 1937 According to the report of the Japan Saké Brewers' Association the shipment of refined saké in the saké year October 1936 to September 1937 amounted to 3,998,369 koku, which is slight decrease from the previous year.

SUPPLY AND DEMAND OF SAKÉ

(Saké Brewers' Association figures)

(In Koku)

Saké Year (October-September)	Production	Shipped	Stock
1931-32	3,531,544	3,700,364	2,524,896
1932-33	4,094,399	3,685,328	2,300,333

Flavours

Oriental flavours are produced in considerable quantities as indispensable for Japanese cooking. The production of soy, or Japanese sauce made of wheat, in factories amounted to 6,072,953 hectlitres valued at ¥82,118,689 in 1937, that of miso, or bean-mash, 215,459 metric tons valued at ¥26,619,372. Saké-lees is used as soop or a soft drink, the production in the same year amounted to 79,813 metric tons valued at ¥8,371,042. The production of vinegar amounted to 461,971 hectlitres valued at ¥2,403,341.

VALUE OF PRODUCTION OF SOY, MISO, ETC.

(Unit: ¥1,000)

Year	Soy	Miso	Vinegar	Saké-lees	Sauce and Ketchup
1933	61,257	16,535	1,953	6,558	3,165
1934	65,477	18,201	2,026	6,114	3,548

1936	71,025	22,582	2,051	6,706	4,801
1937	82,118	26,619	2,403	8,371	5,756

Soft Drinks

As Japan is geologically blessed with mineral springs, the people were not slow to study their medicinal effects, and hot springs were used as baths from olden times. As to the utilization of mineral spring water for drinking purposes, mineral water from Rokko Mountain in Hyogo prefecture was the first of its kind that was put on the market. This was as late as 1833, and the drink was named "Mitsuya Hiranosui". Three years later, some Englishmen taught the making of artificially aerated water and with the importation of Cood's bottles and syphon-bottles the manufacture of sweetened aerated water originated. These drinks soon became very popular and the industry made rapid development. After the Russo-Japanese War, "Champion" cider was put on the market to be soon followed by lemonade, citron, and different kinds of syrup, etc.

At present the total production of soft drinks amounts to 710,000 koku a year, of which sweetened drinks accounts for 93%, the rest being ordinary unflavoured aerated water or soda-water. Producers of soft drinks may be roughly divided into two classes. The first of these is composed of those who manufacture the drinks along with beer. These have good equipment and produce on a large scale. The second class is made up of those many who produce on a small scale and sell their products locally.

VALUE OF PRODUCTION OF SOFT DRINKS

(In yen)

	Cider	Ramune	Syrup	Others	Total
1931	8,509,936	1,803,975	970,528	2,668,945	13,953,384

1937	18,486,295	52,177,373	8,291,972	17,673,521	2,752,981

Note: As to ice, milk, etc. see Chapter XXXII, Medicine and Sanitation.

Soft drinks which are now selling in Japan can be classified from the standpoint of water and gas used into the following:

(1) Those manufactured of natural spring water and natural carbonic acid.

Digitized by Google

(2) Those manufactured of natural spring water and artificial carbonic acid.
(3) Those manufactured of filtered or well-water and artificial carbonic acid gas.

Canning

Introduction

The canning industry in Japan was started as early as 1870, but the real impetus to its development was given by the Sino-Japanese and the Russo-Japanese Wars as they created a great demand for canned provisions for the Army and Navy. The Treaty of Portsmouth also served to further encourage this industry by giving Japan fishing rights in Kamchatka and the Maritime Province of Siberia, and together with the development of can manufacturing and floating canneries, the above have been the cause of the great progress in the canning industry as a whole.

Present Conditions of the Industry

At present, the packing industry in Japan is in a fairly developed state in all of its branches. Canned meats have reached a stage where the quantity of production cannot be increased. The demand for meat in Japan has expanded so far that supply cannot keep pace with demand, a shortage of cattle is being felt and a plentiful supply for canning is not forthcoming. On the other hand, canned vegetable, such as canned bamboo shoots, are finding good markets in the U.S.A. and China. Of all the fruits procurable in cans pineapples are the most popular with the Japanese They are produced in Formosa, and of the 450,000 cases or more that are packed in that island about 400,000 cases are consumed in Japan proper while a greater part of the balance is sold in Formosa, and only a few thousand cases are exported to foreign countries. As to canned fish and shellfish, the production of canned crab and salmon dominates all others. In no other places are canned crabs produced in such large quantities as in Japan, and most of this production is exported to the U.S.A., annual exports being valued at about ¥10,000,000. Red and silver salmon are finding a good market in Great Britain. In view of the fact that catches of salmon on the coast of the U.S.A. and Canada are decreasing the exportation of canned salmon is expected to increase, as also is the exportation of crab-meat, for the demand for it in the U.S.A. is increasing steadily.

PRODUCTION OF CANNED PROVISIONS
(Quantity in kg. and value in yen)

Kinds	1936 Quantity	1936 Value	1937 Quantity	1937 Value
Canned meats	2,914,390	2,609,676	5,670,606	5,607,707
Canned fishes	59,034,014	29,989,998	73,214,369	38,345,455
Canned fruit	22,538,061	7,143,832	28,698,403	9,663,009
,, vegetable	10,853,720	4,372,457	20,209,783	7,692,875
Other canned food	37,294,046	16,153,693	41,807,328	21,387,540
Total	132,634,231	60,269,656	169,600,489	82,696,586

The exports of canned provisions from Japan for 1938 amounted to ¥92,819,000 showing an increase of ¥5,914,000 over 1937. The low exchange rate was a potent factor to have caused the heavy gain in exports. Of the exports, ¥12,212,000 was for the United States; ¥40,832,000 for the United Kingdom.

CHAPTER XXII

CHEMICAL INDUSTRY

Paper

Historical and General

Paper-making in Japan remained a handicraft for over twelve centuries after a Korean priest, Doncho, introduced the technique in 610 A.D. (Some writers maintain that paper existed in this country prior to that date.) During this long period of time, various grades of paper were produced from fibres of certain shrubs such as "kozo[1]," "mitsumata[2]," "gampi[3]," etc.

Foreign-style paper was made for the first time in the 7th year of Meiji, 1874, in a small mill, the Yukosha, Tokyo, through the assistance of an English engineer. Several more mills were established the following year, but the development of the industry was naturally slow on account of the small demand. In the beginning, the raw materials used for foreign-style paper were chiefly rags, but in 1889, wood pulp was used for the first time in a mill which belonged to the Oji Paper Mills, Ltd. At first, the smallness of quantity required and competition from abroad made the industry struggle severely, but as with all other industries, the wars with China in 1894–95 and with Russia in 1904–5 gave it a great chance of development. In 1910, the Tomakomai Mill of the Oji Paper Mills, Ltd., which had been under construction since 1906 began operation. With the establishment of the Tomakomai Mill Japan became selfsupplying with respect to newsprint. Again, the Oji Paper Mills, Ltd., took the initiative in establishing a pulp mill, in 1912, in Odomari, Saghalien Island, but was quickly followed by the Fuji Paper Mills, Ltd., and the Karafuto Industrial Co., Ltd. The industry was just getting well settled when the Great War broke out and prosperity was forced upon it. Importations of foreign-style paper was practically stopped. Demand at home advanced, exports increased and the industry expanded at a great speed. The production of foreign-style paper in 1881 was only 3,968,000 lbs., it increased to 327,614,000 lbs. in 1914, 519,141,000 lbs. in 1919, 317,383,000 lbs. in 1924, and 1,418,187,000 lbs. in 1929.

In 1932 the Oji Paper Mills, Fuji Paper Mills and Karafuto Industrial Company were merged into one firm under the name of the Oji Seishi Kabushiki Kaisha (Oji Paper Manufacturing Company, Ltd.). It has a subscribed capital of ¥300,000,000, and is virtually monopolistic having control over 80% of the total paper production in the country and producing about 85% of the total foreign-style paper. The real strength of the Oji Paper Manufacturing Co., Ltd. lies in its almost complete monopoly of pulp production. In 1937 it turned out 1,702,654 lbs. which was equivalent to 80 per cent of domestic production.

Paper Industry in 1938

The economic control in 1937 and 1938 was aimed at the expansion of the heavy industries at the sacrifice of various peacetime industries. But the paper manufacturing industry in Japan is one of the best organized and voluntarily controlled enterprises in the country and it has been able to cope with the emergency period with the minimum amount of sacrifice on its part. The conditions of paper industry and trade in 1938, therefore, were steady, the exports increasing inspite of a decrease of demand in foreign markets other than the countries in the yen bloc, and the price remained high in general, so that the paper business for the whole year showed as good as the previous year. The Government control over the consumption of paper by daily press was not very strict in view of the importance on the newspapers for the cultural life of the people.

Supply and Demand According to the report of the Japan Paper Manufacturers' Association the production of paper during 1938 by member companies reached 1,948,455,000 lbs., the quantity sold being 2,030,407,000, a decrease of 180,571,000 lbs. or 8 per cent in the for-

1 Paper mulberry. 2 Golden flowered Edgeworthia (Edgeworthia chrysantha). 3 An indigenous plant (Wikstroemia sikokiana).

Digitized by Google

mer, and 2,466,000 lbs. or 0.1 per cent in the latter as compared with the previous year. The decrease was mostly accounted for by the decrease in the production and sale of printing paper, although those of paper for daily press and others showed an increase as it is given in the following table:

PRODUCTION AND SALE OF FOREIGN STYLE PAPERS IN THE PAST FIVE YEARS

(Unit 1,000 lbs.)

	Printing Paper		Paper for Daily Press		Others		Total	
	Production	Sale	Production	Sale	Production	Sale	Production	Sale
1934	449,407	463,061	688,228	687,283	453,840	455,541	1,591,475	1,605,885
1935	509,259	474,436	736,245	729,585	474,133	476,648	1,719,637	1,680,670
1936	544,194	570,080	768,142	766,534	513,510	536,025	1,825,848	1,872,640
1937	655,573	616,599	825,189	811,291	648,264	604,983	2,129,026	2,032,873
1938	400,799	483,388	857,463	852,896	690,193	694,123	1,948,455	2,030,407

Decrease of Imports The imports of paper in 1938 amounted only to 111,192 piculs, a remarkable decrease of 88 per cent as compared with the previous year. The main reason is to be found in the strict trade control by the Government over the peace time goods, especially in the case of imports.

Increase of Exports But the exports of paper in 1938 amounted to 2,483,851 piculs, an increase of 22 per cent over the previous year. Of the total amount, 2,105,845 piculs or 84 per cent went to the yen bloc areas, China buying more than twice as much as in the previous year. The other countries bought 378,006 piculs or 16 per cent against 621,561 piculs or 30 per cent for 1937. Detailed figures are given below.

PRODUCTION OF PAPER SINCE 1928

(Factory Statistics by the Ministry of Commerce and Industry)
(Quantity in 1,000 kg. and value in ¥1,000)

Fertilizers

In 1931 the association formed by manufacturers of chemical fertilizers, maintained a high rate of curtailment of production in order to minimize the loss which resulted from the general alarming situation in industries, especially in agriculture, but the dumping of sulphate of ammonia by British and German manufacturers swept the fertilizer market and the prices of bean cake, fish guano, sulphate of ammonia, superphosphate of lime, mixed fertilizers, cyanamide, etc., slumped to destructive levels. The domestic manufacturers did everything possible in their powers to stop importations. They proposed the raising of the rate of import duty, the passing of a law, the establishment of a system of special permits for import and export, and so on, but practically in vain. The price of sulphate of ammonia declined to as low as ¥60 per ton. The situation was very serious, and at last, in November, a special permit system was put into effect through a Departmental ordinance. A ministerial change took place during December and the Seiyukai Party came into power. The Government at once re-imposed the embargo on gold, exports and the stock market immediately became active, and industries, including the fertilizer industry, followed suit.

The problem of food in Japan is a serious one. The Japanese population is increasing yearly by about a million, but the amount of food produced in the country is not enough to feed them. Besides, the arable land in the country is so small and limited that hardly any space is left to effect any further increase, and the only method left, beyond extending abroad, is to increase the yield of crops through intensive farming. For this fertilizers are necessary and the demand has steadily been increasing. The consumption of fertilizers during 1937 was valued at ¥758,754,000, of which ¥387,960,000 were self-supplied fertilizers, while ¥370 million's worth were bought in the market.

General Condition of the Industry

Chemical Fertilizers Of all the chemical fertilizers, superphosphate of lime and sulphate of ammonia are the two representative ones, and because of the largeness of their demand and supply the market trend of these two is practically the market trend of the rest.

Superphosphate of Lime The principal raw material for the manufacture of superphosphate of lime is phosphate rock. During 1930 some 570,000 tons were imported, while some 63,385 tons were produced at home, and during 1937 and 1938 imports were 922,317 and 564,169 tons respectively. This rock is imported from U.S.A., Egypt, and the South Sea Islands.

Superphosphate production has been gaining steadily and in 1937 its production was 1,582,985 metric tons valued at ¥64,542,455. Production during the past few years is reported by the Ministry of Agriculture and Forestry as follows:

PRODUCTION OF SUPERPHOSPHATES

(In metric ton)

1930	957,159
1931	862,401
1932	1,041,497
1933	1,116,573
1934	1,126,149
1935	1,331,616
1936	1,437,196
1937	1,582,985
1938 (estimate)	1,284,043

Supply and demand of superphosphate in recent years follow:

Digitized by Google

	Production	Exports and Re-exports (1,000 tons)	Consumption in Japan Proper
1930	957	35	922
1931	862	32	808
1932	1,041	81	960
1933	1,116	106	1,009
1934	1,126	121	1,004
1935	1,331	151	1,150
1936	1,437	168	1,242
1937	1,582	170	1,379
1938 (estimate)	1,284	190	1,094

Sulphate of Ammonia The demand for sulphate of ammonia has steadily increased for years. Consumption in 1930 was 488,000 tons, in 1931 it showed a remarkable increase to 618,000 tons. Imports in 1930 were 302,905 tons (value ¥29,612,000), in 1931 they decreased to 224,148 tons and in 1932 a decrease to 119,000 tons was witnessed, value being ¥15,861,000 and ¥7,035,000 respectively. The decrease in imports was made good by the increase in domestic production, which in 1931 was 393,237 tons, and increased to 880,262 tons in 1936 and 931,821 tons in 1937. Japan, in this manner, has become self-supporting in sulphate of ammonia, and has become very uneasy regarding overproduction in the future.

Supply and demand of ammonium sulphate in Japan in recent years follow:

	Production	Imports	Imports from Territories (In metric ton)	Exports	Exports to Territories	Consumption in Japan proper
1930	265,826	302,905	18,065	14,924	83,872	488,000
1931	393,237	224,148	53,260	11,608	41,395	617,642
1932	459,663	118,735	125,123	17,956	67,440	618,125
1933	471,398	108,449	83,722	50,061	62,244	551,264
1934	494,350	160,901	84,749	1,526	88,058	650,416

1938 (estimate)	1,463,875	295,823	76,504	—	262,398	1,573,804

Lime Nitrogen While lime nitrogen was a fertilizer difficult to make farmers use it, they now recognize the merit of this nitrogenous fertilizer, and owing perhaps to its reasonableness in price, its consumption increased with a great stride. In 1931 its consumption was 168,448 tons, in 1932 177,632 tons, in 1933 216,525 tons, and in 1934 169,071. Production increased rapidly too. While, in 1924, it barely amounted to about 121,000 tons, it increased up to 290,398 tons in 1936, more than two times as large. 1937 production was 323,508 tons valued at ¥26,050,622.

PRODUCTION OF LIME NITROGEN

(In metric ton and in ¥1,000)

Year	Quantity	Value
1930	228,383	16,959
1931	168,042	8,743
1932	180,583	10,660
1933	223,409	15,159
1934	197,252	14,323
1935	260,632	20,633
1936	290,398	23,276
1937	323,508	26,050
1938 (estimate)	270,655	—

Vegetable Fertilizers Vegetable fertilizers are many in kind. Bean cake, rape-seed cake, cotton-seed cake, rice bran, etc., come into this class of fertilizers, bean cake being the most important. Supply and demand of bean cake for 1930-1938 were:

SUPPLY AND DEMAND OF BEAN CAKE

(In metric ton)

	Production	Imports	Imports from Territories	Exports	Exports to Territories	Consumption in Japan proper
1930	232,727	889,743	17,451	10,557	1,136	1,087,476

1938 (estimate)	280,000	623,054	27,152	2,428	432	927,346

Bean Cake The domestic production of bean cake is very small when compared with the quantity imported, the greater part of which comes from Manchoukuo. In 1916 the consumption of bean cake, was 807,975 tons, which, by 1926, increased to 1,510,088 tons, but since then no increase can be noted as the development of the synthetic nitrogen industry has cut deeply into the development of vegetable fertilizer industry.

Fish and Animal Fertilizers In Japan fish is indispensable as food, but at the same time they are caught for oil extraction and the refuse is converted into manure. (See Chapter XV.)

In addition to chemical, vegetable and animal fertilizers, a great quantity of self-supplied fertilizers are supplied and consumed, the figures for which are given also in statistics attached at the end of this subject.

Statistics

According to the report of the Ministry of Agriculture and Forestry the value of production and consumption of various kinds of fertilizers were as follows:

VALUE OF FERTILIZERS PRODUCED IN JAPAN PROPER 1928-1937

(Fertilizers Which Require a Licence for Prodution)

(Unit ¥1,000)

Year	Animal	Vegetable	Chemical	Mixed	Miscellaneous	Total
1928	22,254	39,667	82,483	53,112	318	197,833

Caustic Soda, Soda Ash, Bleaching Powder, Dyestuffs, etc.

Soda Ash Industry

Soda ash occurs in its natural state in some parts of the world, but in this country it has to be prepared from salt, and as salt is a Government monopoly the price is high, so when the Asahi Glass Company, in order to attain self-sufficiency, started the production of soda ash after the World War it did so on uneconomic basis, but the Government came along and by granting liberal subsidies to this and other concerns saved the industry and put it on a paying basis. Brunner, Mond and Company (British) and H. Ahrens and Company (German), who used to be the largest importers, were hit hard by this development in home production. The history of the growth of the soda ash industry in Japan is the history of strife between the Asahi Glass Company, backed by the Mitsubishi interests and protected by the Government, and these foreign concerns. The total production of soda ash in 1937 was 377,000 metric tons while 46,276 metric tons were imported.

Caustic Soda

As a by-product of the production of caustic soda the poisonous gas chlorine freed. This gas is made into commercial bleaching powder, and in the past the commercial production of caustic soda was only possible if a good price was obtained for bleaching powder. The industry, therefore, was greatly dependent on this latter commodity for quantity production. As soda ash is now being produced cheaply, caustic soda is being manufactured from it so domestic production is increasing. The replacement of the gold embargo and the raisng of the tariff virtually sealed the activity of the British importing concern, whose pressure was a great hindrance to the development of the Japanese soda industry, and selfsufficiency in the production of both soda ash and caustic soda has been thereby attained. Brunner, Mond and Company has largely restricted its activities and home production has greatly increased. The Asahi Glass Company and Nippon Soda Kaisha, known as N. S. K., have recently expanded their equipment for producting soda ash to an annual productive capacity of 150,000 tons, which is about 30,000 tons more than the yearly domestic demand. The production of caustic soda in 1937 was 362,141 metric tons and for 1938 it is estimated at 440,-760 metric tons.

Bleaching Powder

The demand for bleaching powder has become active since an improvement was registered by the paper manufacturing companies, who consume 70 per cent of the total production. The business solely depends on the rise and fall of the foreign-style paper manufacturing industry.

Soap Making

Development and Production

The industry was started early in the Meiji Era, but no great progress was made until after the Russo-Japanese War of 1904–1905, when machinery was introduced from abroad. During the World War, the industry enjoyed great prosperity, but the reaction was also very severe when it came in 1920. However, during those difficult times, the foundation of the industry became more consolidated and the quality of soap improved a great deal.

Production of soap in Japan is as per the accompanying table. Tokyo and Osaka are the two principal places of production, the former producing about 50% of the total production in the country, while Osaka produces about 30%. Exports of soap amounted to ¥7,837,000 in 1938 while imports was less than ¥100,000.

PRODUCTION OF SOAP BY KIND

(In ¥1,000)

Vegetable and Animal Oils and Fats

Introduction

For lighting purposes vegetable oils have been used in Japan for centuries. In earlier days perilla oil was used but this was later replaced by rapeseed oil. The production of these oils on an industrial basis only developed after the Russo-Japanese War of 1904–1905.

Production of hardened oil in Japan during 1937 amounted to 97,132 metric tons in contrast to 75,663 metric tons in 1936. It is used mostly for soap making, candles and dietary purposes. Even during the time that Japan was on

Digitized by Google

gold, hardened oil was exported, so after the gold embargo was imposed exports increased. The exports amounted to 328 metric tons in 1937 and 209 metric tons in 1938.

The principal vegetable oils produced are soya bean and rapeseed. Linseed oil, perilla oil, hempseed oil, wood oil, sesame oil, cotton-seed oil, castor oil, groundnut oil, copra oil, camellia oil, etc., are also produced in considerable quantities. The production of soya bean oil in 1937 was 51,342 metric tons and rapeseed oil was 34,720 metric tons.

Of the principal vegetable oils produced in Japan, only wood and camallia oils and vegetable wax are pressed from domestically grown seeds, all the others are pressed from materials from abroad. The amount of exports of soya bean oil, rapeseed oil, and other vegetable oils was 501 metric tons in 1937, but decreased to 233 metric tons in 1938.

Statistics Statistics for the vegetable and animal oil industry follows :

PRODUCTION OF VEGETABLE OILS

(Compiled by the Ministry of Commerce and Industry)

Rubber Industry

The rubber industry in Japan began with the establishment in 1886 of the Mitatsuchi Rubber Company, a limited-partnership concern, in Tokyo. The industry developed steadily through the Sino-Japanese and the Russo-Japanese Wars of 1894–1895, and 1904–1905. In 1909 there were 20 mills, 900 workers and production reached ¥4,000,000 in value. During the World War the industry further developed. The earthquake of 1923 destroyed about 80% of the rubber manufacturing capacity of Tokyo and Yokohama districts, and many people were gravely doubtful as to whether the rubber factories in those districts would ever revive, but reconstruction quickly took place and the factories rebuilt. In 1937 the total production in the country by mills employing more than 5 persons was as large as ¥201,710,000 in value, but the figure would be much larger if goods produced by people working in their own homes were included.

Rubber Industry in 1938

According to the report of the South Sea Gum Planters' Association the world production of rubber in 1938 amounted to 872,055 tons and Japan consumed 73,478 tons, standing the sixth among rubber consuming countries. The imports of rubber in the same year reached 784,372 piculs valued at ¥51,374,000 a decrease of 278,228 piculs and ¥47,844,000 as compared with the previous year.

The total number of factories and small shops for rubber manufactures in Japan is said to reach 9,900. At the end of 1936 the number of factories which employ more than 5 operatives was 832 of which but 2 employed more than 500 operatives. The control of rubber imports by the Government seriously affected the smaller shops and factories which ran short of the material during the year. Figures for the production of rubber manufactures for 1938 are not yet available, but their exports amounted to ¥21,228,000, showing a decrease of ¥9,372,000 from the previous year.

Reclaimed Rubber With the advance of economic control in Japan the reclamation of rubber from the discarded and waste rubber products began to be encouraged by the Ministry of Commerce and Industry.

At present the reclaimed rubber produced and used in Japan amounts to 8,000 tons or 13 per cent of the total amount of rubber which amounts to 60,000 tons annually. If the amount is increased to 18,000 tons or 30 per cent the imports of rubber may be reduced by ¥10,000,000, after deducting the money paid for the waste tyres imported from America and Canada. To attain the purpose the rubber committee of the Federation of Economic Bodies met on December 8, 1937, and recommended the improvement of the method of reclamation by an alkali process instead of the former oil process, the standardization of the reclaimed rubber and the rates of mixing it with raw rubber according to grades. By the mixture of the best reclaimed rubber with raw rubber improvements may be effected in the manufacture of tyres and special rubber articles in addition to lowering the cost. The hardships experienced in obtaining sufficient supply of raw rubber in 1937 may become a spur for the progress of this new field of chemical industry in Japan.

BUSINESS RESULTS OF RUBBER COMPANIES

Imports and Exports

The importation of rubber manufactures is decreasing each year. Tyres for automobiles, hose, belting for machinery, old rubber, etc., are the principal imports, but hose and belting of domestc manufacture are rapidly replacing the imported articles. On the other hand, the exportation of rubber manufactures is developing rapidly, especially in the case of rubber shoes.

Cultivation of Gum Trees

Plantation work by the Japanese was started as early as 1906 in the Malay States, and was later extended to Sumatra, North Borneo and other places. Soon afterwards a great interest was taken in the industry, Japanese investments quickly grew, and the work that was originally started as a private enterprise is now mostly carried on by joint stock companies. Majority of the raw rubber consumed in Japan is the production of the Japanese rubber companies which carry plantation work in South Sea Islands.

IMPORTS OF RAW RUBBER AND EXPORTS OF PRINCIPAL RUBBER MANUFACTURES

Celluloid

General

The Japanese celluloid industry made considerable development during the World War. Owing to a heavy demand coming from European countries, where factories were closed by the War, Japanese celluloid products once dominated the world's markets, but with the termination of the War, foreign products quickly regained their position in the markets captured by Japan during the War, and for some years the industry was in a state of depression. Gradually penetration was effected by traders and exporters, and overseas markets were largely restored, especially after the replacement of the gold embargo in December, 1931. The domestic market has been prosperous for many years, without being affected very much by changes in economic conditions.

Japanese celluloid products are mainly exported to America, England, South America and Australia. They are now exported to Europe and Africa, in competition with German products, their most formidable rivals. As long as the exchange rate is low and tariff walls are not raised, the export trade is destined to be prosperous.

Celluloid manufacturing is one of the most promising industries in Japan, with total production amounting to ¥33,396,000 in 1936 and exports reaching ¥24,576,000 in 1937, but it is faced with one great difficulty, that of obtaining its chief material cheaply. Camphor is the material, but as this is restricted by monopoly law its price is kept fairly high.

The Dai Nippon Celluloid Kaisha is the largest manufacturer, with a subscribed capital of ¥20,000,000. 75 per cent of the total production in Japan comes from this company, while the remaining 25 per cent is divided among about ten small manufacturing concerns. The company, which has a virtual monopoly of celluloid manufacturing in this country, concentrates its energies on exporting. Nearly 80 per cent of Japan's total exports of celluloid are the produce of this company.

Cellophane is manufactured at the Kanzaki factory of the company, and is now procurable at very low prices.

The company is also the largest shareholder of the Fuji Photo-Film Company established in 1934 with a capital of ¥10,000,000. This company has a capacity of producing 150 million feet, and nearly monopolizes the manufacture of films in Japan, which amounted to ¥4,666,000 in 1936; the other film producing company being the Oriental Photo Industrial Company capitalized with ¥4,300,000.

Statistics Production of raw celluloid, celluloid manufactures, and exports of the same follow:

PRODUCTION OF CELLULOID AND MANUFACTURES THEREOF

Year	Raw Celluloid Quantity metric tons	Raw Celluloid Value	Manufactures of Celluloid Toys (In ¥1,000)	Combs	Others	Total	Grand Total

1930	161	298	4,423	631	—	1,267	6,322	6,621
1931	304	504	3,041	763	—	920	4,725	5,230

Digitized by Google

Year	Raw Celluloid		Celluloid Manufactures					
	Quantity metric tons	Value	Toys	Combs (In ¥1,000)	Armlets	Others	Total	Grand Total
1932	511	875	2,527	1,467	—	1,494	5,490	6,366
1933	1,320	2,363	3,178	3,110	—	2,346	8,635	10,993
1934	1,804	3,303	3,708	4,260	—	3,223	11,191	14,494
1935	2,033	3,469	6,054	4,414	1,983	3,089	15,550	19,021
1936	2,242	3,717	6,338	3,857	1,815	4,271	16,280	19,997
1937	2,100	3,952	7,606	4,854	2,711	5,403	20,574	24,576
1938	1,225	2,730	4,841	2,851	1,664	4,044	13,400	16,130

Note: Incongruity in the figures of celluloid manufactures in the production and exports tables is due to the fact that a large amount of celluloid manufactures is produced by mills where less than 5 persons are employed.

Dyestuffs

Through Governmental protection extending over many years, the Japanese dyestuff industry is now well established. Japan supplies 99 per cent of all sulphuric dyes demanded domestically. Concerning ratios of high-grade dye supplies, Japan can supply 86 per cent of miscellaneous dyes, 49 per cent of acid dyes, 35 per cent of mordant dyes and 26 per cent of cat dyes for internal use. Coal-tar dyes were already exported in 1934 to the volume of 7,023 metric tons, worth ¥4,259,000. Napthol and Indanthrane dyes, of which consumption is approximately 150,000 kin worth about ¥3,000,000, are not manufactured here, but are imported from Germany. Research in producing these dyes is under way by the Mitsui Mining and Japan Dyestuff Manufacturing Companies. The Teikoku Senryo (Imperial Dyestuffs Manufacturing) Company is another producer of dyestuffs capitalized at ¥5,000,000.

On account of the restrictions put on the manufacture of certain of the high-grade dyestuffs by German patents, Japan still finds it necessary to import dyestuffs to the value of more than ¥10,000,000 annually. On account of the development of iron manufacturing industry, however, Japan is now well provided with coal-tar, material required for the production of dyestuffs. Accordingly, efforts are now being made to promote the dyestuff industry with a view to making the country self-sufficient and self-supplied in dyestuffs.

Imports of dyestuff in 1938 were ¥2,838,000 in value, and showed a remarkable decrease as compared with ¥16,928,000 for 1937, details of which follow:

IMPORTS OF DYESTUFF

Colours	1936	1937 (In ¥1,000)	1938
Basic	796	1,246	145
Direct	3,013	4,708	834
Acid	1,776	2,537	644
Mordant and intermediate	2,006	2,651	389
Vat	2,458	4,079	366
Others	2,355	1,707	460
Total	11,404	16,928	2,838

The domestic production of dyes during 1937 compared with the preceding four years and exports of Japan-made dyes since 1933, follow:

PRODUCTION OF SYNTHETIC DYESTUFFS

Year	Basic		Direct		Acid		Mordant

1936	1,169	347	320	109
1937	1,182	346	322	112

Pyrethrum

Hokkaido is noted for producing the pyrethrum flower, the raw material for anti-insect powder largely used for making mosquito incense and anti-bed bug powder. Pyrethrum was formerly exported through Kobé merchants, but owing to inconvenience the Hokkaido Government encouraged direct shipments from Hokkaido, the first direct shipment being made in September, 1933. The Hokkaido Government also caused pyrethrum manufacturers to organize the Manufactured Pyrethrum Industrial Guild, as the first step to the export of manufactured pyrethrum abroad, which had hitherto been exported in the shape of dried flowers. As an international commodity, manufactured pyrethrum is steadily gaining ground, and under the encouragement of their government, the Hokkaido pyrethrum raisers are manufacturing it for direct export to the United States, Saigon, Bangkok, Rangoon, Manila, Singapore, Sourabaya, Batavia, Calcutta and Bombay, and to such European markets as London, Hamburg and Paris. Wakayama prefecture is also noted for raising pyrethrum flowers. Production and exports of pyrethrum during the last few years follow :

PRODUCTION AND EXPORTS OF PYRETHRUM

CHAPTER XXIII

MISCELLANEOUS INDUSTRIES

The Kiln Industry (Cement, Ceramics and Glass), Matches, Lacquer-ware, etc.

Cement

History

In 1871, cement works were established by the Government in Fukagawa, Tokyo. This was the origin of the cement industry in Japan. For ten years the works gradually expanded so that by 1891, the total capital invested in the industry was ¥1,000,000, the works numbered ten and the capacity was about 300,000 barrels a year.

In 1898, there were sixteen works with an aggregate capacity of 1,000,000 bbls, and imports were entirely excluded. In 1912, there were nineteen companies and twenty three mills. The total capital invested amounted to ¥18,000,000 while the capacity increased to 4,000,000 bbls.

During the World War, the industry enjoyed unprecedented prosperity and expanded rapidly. New companies were formed and new mills added. At the end to 1926, companies numbered twenty-one with thirty four mills, the total authorized capital was ¥118,000,000 of which ¥85,000,000 was paid up, and the total production capacity increased to 17,500,000 bbls.

During the last twenty years, demand for cement increased every year with five exceptions, there was a 2% decrease in 1912 and a 10% in 1915 and 1919. The average rate of increase was about 11%. But in 1930, domestic consumption suddenly decreased by 12%, the first time that any such sharp decrease had ever been experienced. The decrease was due to the general depression and the economic retrenchment policy of the Government following the removal of the gold embargo in January, 1930. In 1931, there was a further decrease, but in 1932, with general activity in industry being felt, there was some recovery over the previous two years.

The Industry in Recent Years

For some years in the past, the interest of cement industry in Japan centred on the question of the adjustment of over-extended capacity of production. The result is a large curtailment of production.

In 1925 capacity was about 50 per cent larger than the output, which became almost 100 per cent in 1934. In recent years the greatest consumption of cement, including domestic consumption and export, was 480,000 tons of May, 1934, while the production capacity at the end of November of the same year was 1,020,000 tons a month. For almost a year 57 per cent of the Cement Association's (Cement Rengokai) capacity has been curtailed.

The cause of this abnormal condition of the industry is found in the fact that in fixing production curtailment ratio of the member companies of the Rengokai, it has been based on the capacities of production of the members. This led the member companies to expand capacities to get larger shares of business. The situation culminated in the latter part of 1934 in forcing the Department of Commerce and Industry to apply the Major Industries Control Law to the cement industry.

PRODUCTION OF CEMENT

(Compiled by the Ministry of Commerce and Industry)

Year	Portland Cement		Others		Total value in Yen

1938 Cement Industry

The China Affair seriously affected the cement industry in 1937 and 1938. The total production of cement in 1937, however, reached 6 million metric tons increasing by half a million metric tons as compared with the previous year. The total production in 1938 reached 5,519,062 metric tons decreasing 514,000 metric tons from the previous year, owing mainly to the halt in construction activities due to the State economic control, and the decrease of demand for Japanese cement in foreign markets.

The restoration of peace and order in Chinese areas occupied by the Japanese forces recovered the exports to China, but the total exports amounted to 491,432 metric tons decreasing by 94,880 metric tons or 16 per cent as compared with the previous year.

The curtailment of capacity in the factories which belonged to the member companies of the Cement Manufacturers' Association had to be kept at an average of 63 per cent throughout the year 1938, and the Association decided on August 18, 1939, to keep 60 per cent curtailment to the end of November, 1939.

CURTAILMENT OF PRODUCTION OF CEMENT

(The Cement Manufacturers' Association)

	Percentage	
	1937	1938
January	63.0	65.0
February	63.0	65.0
March	61.0	63.0
April	58.0	61.5
May	58.0	61.5
June	56.0	59.0
July	56.5	61.0
August	56.0	61.0
September	60.0	64.0
October	62.0	66.0
November	62.0	66.0
December	65.0	69.0

Increase of Stock According to the report of the Warehouse Association the amount of stocks of cement which was 216,099 metric tons in 1937 increased to 258,977 metric tons in January, 1938, to 298,265 in July, and decreased to 228,399 at the end of the year. But it began to increase in January, 1939.

According to the report of the Cement Manufacturers' Association the amount of stocks of cement and clinker combined was 450,353 metric tons in January, 1938, and increased to 525,419 metric tons at the end of the year. The estimate for the end of 1939 is put at 600,000 metric tons.

Digitized by Google

Capacity of Production The production capacity of cement companies is on a steady increase inspite of the adverse business conditions. The monthly production capacity of the member companies of the Cement Manufacturers' Association was 835,000 tons in January, 1937. It increased to 832,000 tons in November, and 900,000 tons in December, an increase of 65,000 tons over 1936. Japan proper may be able to get a supply of cement amounting to 1,230,000 tons monthly including 200,000 tons of cement produced by companies outside the Association and 130,000 tons imported from Korea. The monthly production capacity of the member companies of the Association in 1938 increased from 900,000 metric tons in December, 1937, to 938,460 metric tons in December, 1938.

EXPANSION OF THE PRODUCTIVE POWER OF THE CEMENT MANUFACTURERS' ASSOCIATION

(Monthly Capacity)

(In 1,000 tons)

	1936	1937	1938
January	792	836	911
February	792	837	911
March	791	861	911
April	792	861	921
May	793	861	921
June	792	872	917
July	802	873	917
August	802	882	918
September	815	882	917
October	815	882	919
November	815	882	919
December	835	900	938

Rise in Cost and Price The rise in cost of production in 1938 badly affected the profit of cement companies.

The Tokyo price of cement steadily rose during 1938, from ¥1.25 per bag (50 kg.) in January to ¥1.35 in December, making an average for the year ¥1.28 against ¥1.25 for the previous year.

Extension to North China The total annual output of the ten Chinese cement companies is estimated at 1,170,000 tons, and the actual shipment by these companies to districts in North China amounts to 100,000 tons, against the demand amounting to roughly from 250,000 to 330,000 tons. The leading Japanese cement companies such as Asano, Onoda, Iwaki, Osaka Ceramic and Ubé are preparing to gain larger markets in North China in 1938 and after.

At the end of 1937 Japanese cement companies met together to consider the question of a joint exportation of their products to North China, in view of the prospective increase of demand for cement in that area with the advancement of reconstruction works and the revision of tariff rates which had been prohibitive, and arrived at an understanding.

Their expectation seems to have been fulfilled for the exports of cement to China in 1938 reached over five times as much as in 1937, amounting to 75,659 metric tons valued at ¥911,000 against 13,249 metric tons valued at ¥138,000 of the previous year. When compared with the normal year of 1936, the amount increased over three times in which it amounted to 22,550 metric tons.

SUPPLY AND DEMAND OF CEMENT

(Compiled by the Cement Manufacturers' Association)

(In metric tons)

	Production Capacity Cement	Clinker	Shipments to Japan Proper		Production Capacity Cement	Clinker	Shipments to Japan Proper

Introduction

Pottery making has an old history in Japan. As far back as can be traced in history some potters appear to have had their secret proprietary methods of production. In the Meiji Era, especially after the Russo-Japanese War, along with the advance in industry in general, pottery making was industrialized, a procedure which was thought difficult of accomplishment, and to-day annual production amounts to from ¥60,000,000 to ¥80,000,000 in value, while exports amount to over ¥30,000,000. It is now one of the principal industries in Japan.

The chief places of production are Nagoya and Seto, both in Aichi prefecture, and the eastern part of Gifu prefecture. The quantity produced in these places amounts to about 70% of the country's total production. Seto is such a famous place for pottery that the Japanese commonly call chinaware "Seto-mono." Besides the products named above "Kutani" ware of Ishikawa prefecture, "Shimizu" ware of Kyoto prefecture, and "Arita" ware of Saga prefecture, are all famous though produced in small quantities only. Nagoya district is one of the largest pottery producing places in the world.
